(2.) **Reason.** By means of reason, considered as a source of knowledge, we obtain knowledge of what lies beyond immediate sensible experience, and is in this sense supra-sensible. Thought, or the action of the intellect, is—as we saw in speaking of the "agent of Logic"—based upon, or rather sets out from experience, but rises above it into the higher sphere of the supra-sensible and transcendental. Truths belonging to this sphere are called truths of the intellect, or truths of the reason, in the wide sense of the term. Now, to know that these truths are true, reason must apprehend, *i.e.*, *see* their truth; and this can only be done by knowing the *reason* why the judgment or proposition enunciated about them is what it is, and not other than it is. Such knowledge may be either clear and well ordered, or obscure and confused. In both

cases it may form the basis of a judgment; but in the first case we judge according to the light of reason; in the second case we judge according to "common-sense." Hence the subdivision of Reason as a source of knowledge.

(a.) With reference to what has been said, the **discernment or light of reason** may be defined, the apprehension of the truth of a proposition by means of clear systematic knowledge of the grounds upon which its truth depends. This definition tallies pretty nearly with that of subjective scientific knowledge;[2] and now we cannot fail to see why, in anticipation of this further meeting with it, it was on first acquaintance rather summarily distinguished from experience and faith. Subjective knowledge was then shown to be either immediate or mediate; and so therefore must be the discernment or light of reason, which is immediate in **intuition,** where the ground of the truth of a proposition is perceived at once without any process of reasoning; mediate in syllogistic **reasoning,** either **inductive or deductive.**

Thus the **truths** obtained by this source of knowledge are:

(*α.*) All first principles, or self-evident truths: these we get by intuition.

(*β.*) All truths of the intellect or reason obtained by means of induction and deduction.

We see then that reason is only a limited source of knowledge, and does not give us the mysteries of faith, which we can only come to know by means of Divine Revelation.

But is the discernment of reason **trustworthy,**

[2] See p. 142.

and so is it in its mediate and immediate judgments a motive of certainty? Without begging the question, we cannot make an argument answer this query; but it is possible to show to what extent there is no possibility of deception in this source of knowledge:

(*a.*) First of all, with regard to intuition,—in a proposition whose truth I perceive immediately, the predicate and its relation to the subject are obtained immediately by an analysis of the subject itself; *e.g.*, the whole is greater than its part. When I know what the subject is, *e.g.*, the whole, I possess in that knowledge both the predicate and its relation to the subject, as is evident in the given example; and my judgment is nothing but the transference of this relation to my thought. Here then is no possibility of deception. If there were any such possibility, if I were able to doubt or deny what I intue, or immediately apprehend as self-evident, I should have far greater reason to deny or doubt what I do not cognize as self-evident.

(*β.*) Then, with respect to mediate discernment obtained through syllogising, there will be no deception if two conditions are observed, viz., the principle from which the argument proceeds must be true, and the syllogism itself must be both materially and formally true. When this is secured, the conclusion must of necessity be true, as has been shown elsewhere.

(b.) **Common Sense**, a much maligned property, which most people claim as their own, while they disbelieve in its possession by any one who happens to have the misfortune, or perhaps the "pluck" to

differ from them, is one of those terms which serve to cloak many false meanings. It does not consist in personal infallibility in daily life, an impossible quality existing only in the self-estimation of the self-righteous; nor is it an exclusive gift belonging solely to some age or clique. Old folks must not say its monopoly is in their heads; still less can such a claim be set up by the young or middle-aged; and least of all is it true of those too numerous specimens of humanity, who make "common-sense" a synonym for their own mental obtuseness, and are usually endowed with the rough bluntness which is fast usurping the name of true simplicity. Common sense is a gift of our common human nature, hence a gift given to all, though in varying degrees—*sensus naturae communis*—and has been not unhappily described by an American writer as "reason in her every-day dress." It may be defined as that natural quality of the human reason, by means of which it forms certain judgments, and holds them to be true, without knowing clearly and systematically upon what grounds the truth of such judgments depends. Of course, an argument in disguise really underlies them; for we do not judge blindly; and the judgment of common sense is not purely instinctive; but as the reasoning is not explicit, we are not clearly conscious of it. In this way our minds apprehend many truths without going through scientific investigation and argument; and so common sense cannot be omitted from the enumeration of the Sources of Knowledge.

It is undeniable that among all people and in all ages a constant uniform judgment has prevailed

regarding certain truths which have a great influence on daily life, and which are of such a nature that without a knowledge of them it would be impossible to lead a really rational and moral life. Such unvarying uniformity of judgment must have a constant uniform ground, and this can be found nowhere but in the rational nature of man, which is essentially the same among all people and in all ages. The judgment proceeds from this common nature by means of a faculty which does not judge from blind instinct, but with rational thought, though without clearly apprehending the reason why it judges truly, or putting the hidden reason into argumentative form; and this we have seen to be common sense.

The **truths** which come to our knowledge by its means are confined to certain truths of the intellect or reason, which belong *per se* to the mediate perceptions of reason by argument. Hence the teachings of experience and the first principles gained by intuition do not fall into this category, which includes only such mediately known truths of the intellect as are closely related to our practical life, in so far as such knowledge is necessary to us if our practical life is to be rational and moral. Such truths, for instance, are—the existence of God; our duty of paying Him religious honour (the idea of Divine Unity is really at the bottom of every form of polytheism; and atheists are, compared to the mass of mankind, abnormal and exceptional, and moreover have an unerring tendency to develope into theists, or rather to show their true colours and honestly own to the belief of which they have never

rid themselves, when danger threatens in the shape of a storm at sea, a great conflagration, &c.); that there is an essential difference between good and evil; that reward or punishment awaits us in the next life; that parents are to be honoured; that man has a free will; that we must be just in business transactions; that physical ills may be remedied or alleviated, &c. All these things obviously admit of syllogistic proof, but we are certain of them with a natural certainty (q.v.), without any scientific proof of their truth.

To know whether in any given case a truth comes to us by way of common sense, we must be sure that it fulfils the following **conditions**:

(α.) that it can fall within the sphere of common sense;

(β.) that it is either actually or virtually the constant uniform judgment of all people and ages, hence has their common consent—*consensus communis*—which is strengthened instead of weakened by the progress of civilization. *Consensus communis* is not identical with *sensus communis*; it is its indicative mark.

(γ.) The judgments which depend on common sense must not be opposed to the first principles of reason, but on the contrary be further confirmed when these principles are applied to them, as is the case with the examples given.

If these conditions are observed, the **trustworthiness** of common sense as a motive of certainty is beyond all doubt. It cannot deceive us; and this is made clear by its very essence. If common sense could deceive us under the given conditions,

the cause would lie in our rational nature as such; and so we should be assuming that reason was, not *per accidens*, but in its very nature leading all mankind through every age into false judgments, and so into error, which would be manifestly absurd, and do away with the certainty of all knowledge.

From what has been said on the vexed question of common sense, it will be seen that its most accurate popular meaning, which may be loosely described as being "all there" in matters practical, does not differ substantially from what may in contradistinction be called its scientific meaning, which is quite wide enough to include the sober intelligent apprehension of men and things, that is, put into practice by being "all there."

(3.) **Authority,** as a source of knowledge, proceeds from the credibility of the person who testifies, and this again depends upon his knowledge and veracity; for the clearer it is that he possesses adequate knowledge of the truth or fact, and that his integrity is reliable, the more ready are we to credit his testimony, inasmuch as he is its security.

As the result of the discernment of reason is scientific knowledge, so is faith the correlative of authority, and, as the acceptance of a thing as true on testimony, it is defined: the assent by which we hold as true things proposed to our belief, on the authority of the person who affirms them. Therefore, presupposing his credibility, faith may be as good a ground for certainty as is scientific knowledge; but, in the absence of this condition, faith must give place to more or less probable opinion (q.v). It may be worth while to call attention to the

implied consequence, that belief and opinion are essentially distinct, though they are often used interchangeably in ordinary parlance.

In Authority, as a source of knowledge, the person who testifies, and who is the security for what he affirms, is called a witness; and his communications form his testimony. The witness is either Divine or human, God or man; and hence the division of authority under its present aspect.

(a.) **Human Authority.** The **truths** we get to know by means of this source of knowledge are of two kinds:

(*a.*) Theoretic and practical propositions which in themselves are ascertained by reason, but which may be also attested by human authority;

(*β.*) Facts of experience which, either owing to our distance from them in space or time, we are unable ourselves to perceive.

Hence, according to this division, the kinds of human testimony must likewise be twofold, viz., Dogmatic and Historical.

Now, **Dogmatic Testimony** is evidently not the source of knowledge to which theoretic and practical propositions primarily and properly belong, for we have seen that they come to us through reason in one or other of its two forms. Hence human authority cannot *in itself* vouch for their certainty; and, as its worth is only proportioned to the value of the *grounds* upon which the teaching rests, no science can be established by its means. Thus, from a scientific point of view, its service is very subordinate indeed.

In another aspect, however, it not only has its

REESE LIBRARY OF THE UNIVERSITY OF CALIFORNIA

uses, but is even necessary: for as an instructor it is an essential condition in that part of education which has the training of the mind for its end. A child takes his first teaching on the authority of his teacher, who says—for instance—that gold is malleable and ductile. He holds it on faith until he comes to know later on in life how the truth of his teacher's proposition can be proved; then, when he has tracked it to its causes, it becomes scientific knowledge. Our friend, common sense, tells us that this is the natural process followed in the development of human reason, and that thus all our strictly rational knowledge practically begins with faith. Again, all of us who are not scientists, and the average men and women of the world, who have neither the brains, nor the physique, nor the time to investigate facts, and put them together systematically when found, are very much in the position of children under a teacher, with this difference that our faith in the facts of science is not likely to blossom later on into scientific knowledge, as may the simpler facts put before children. Very few people indeed calculated the distance of the earth from the sun last time Venus gave us an opportunity of getting the sum right by journeying across his disc; but we all believe our teachers, the astronomers, when they give us the result of their computations. Reason itself inclines us to put faith in those best skilled in any art or science, according to the saying *Cuique in suâ arte credendum*, a text from the bible of common sense.

Widely different from the comparatively limited scope of dogmatic testimony is that of **historical**

testimony, which bridges over the distance that separates us either in space or time from facts of external experience, and so is the proper and only source from which we get to know them. Hence its value and necessity, for the sphere of even the most extended personal observation is very limited, and it is sometimes absolutely needful that we should know things of which, but for human testimony, we should always remain in ignorance. The three channels of historical testimony are **Tradition,** when the relation of facts is handed down orally from generation to generation; **Written documents,** when the story is transmitted by writing; **Monuments,** when it is represented by means of art.

The **trustworthiness** of human testimony depends primarily on the **credibility of the witnesses,** *i.e.*, on their knowledge of what they affirm, and on their veraciousness; and for these to be undoubted there must be the following **conditions:**

(*α.*) The **fact** related must have been in itself possible, and possible under the given circumstances, either naturally or supernaturally, and be of sufficient importance to arouse the attention of those who attest it, or to excite their interest and so induce them to investigate it.

(*β.*) The **witnesses** must either have themselves observed the facts asserted, or have had unquestionable means of information; they should usually be numerous, and differ from one another in character, interests, associations, views, and personal bias. In this case, their testimony cannot possibly concur unless it be true. If only few in number, they must all be of unimpeachable integrity, or else the facts

they relate must have been known to many of their contemporaries, by whom they are not contradicted either implicitly or explicitly. Lastly, they must not deliver their testimony in a party spirit, or write from a prejudiced point of view.

(γ.) Their **relations** of their common subject-matter must at least agree in substance, *i.e.*, there must be no diversity of statement as to essentials; diversity in regard to minor details there must always be, and often it serves to strengthen rather than weaken the main assertion.

By all these means we can assure ourselves of the credibility of the witnesses; but the trustworthiness of human testimony depends likewise on the **integrity** of their testimony, *i.e.*, whether it comes to us as it was actually delivered by them. This, in its turn, depends on certain given **conditions**, viz.

(α.) With respect to the matter of **Tradition**, it must have been something well known to and observed by many persons; the tradition itself should be full and unbroken.

(β.) **Historical documents** must be authentic, *i.e.*, written by the person to whom they are attributed. If this cannot be proved, they must at least belong to the age in which he lived; but a document of this latter kind, *i.e.*, a spurious contemporary, has in itself taken singly no authority, though it may serve to strengthen that of an authentic one. Then, documents must be genuine, *i.e.*, they must contain exactly what was written by their author, neither less nor more; which they will not do if they are corrupted by faulty copyists, or cut down or added to by an interpolator. It is the province of

historical criticism to examine and either to prove or disprove the authenticity and genuineness of alleged historical documents on grounds extrinsic and intrinsic, according to laws and rules which do not fall within the scope of Logic. Acquaintance with them cannot be better made than from Father de Smedt's *Introductio ad historiam ecclesiasticam* and *Principes de la critique historique.*

(γ.) **Monuments**, whether statues, pictures, inscriptions, buildings, etc., must be coeval with the deeds they attest, and in no way contradictory to trustworthy records and tradition.

If these two lists of conditions be observed, it is as clear as noon-day that we can have no reasonable doubt of the facts that we learn by means of historical testimony. Dogmatic testimony, which affirms truths of the reason, may not in itself—as we have seen—be sufficient to produce certainty; but common sense, the concurrence of many judgments, and the utter improbability of the contradictory (to say nothing of argument), in innumerable instances make it impossible to doubt truths which come to us solely through dogmatic testimony.

Thus it will be seen that the human faith, which holds society together in mutual trust and confidence, is based partly on dogmatic and partly on historical testimony, accordingly as it assents either to some truth of the reason or to some fact of experience; and so closely is it allied to common sense that it is often extremely difficult to discover which of them is practically our motive of certainty. For full and most able demonstration of the necessity of belief in daily life, see the lecture on *Belief a*

necessity, No 1. of the series on the *Spirit of Faith*, by Bishop Hedley, and St. Augustine's *De Utilitate credendi*, chapters 12 and 16.

(b.) **Divine Authority** is not of course to be reckoned among natural sources of knowledge, because Divine Revelation is supernatural, and its truths come to us in a supernatural way. Hence Christianity, in which we receive divinely revealed truths on Divine authority, is not natural but supernatural knowledge. Hence, it must be based, on the one hand, on a supernatural motive—the veracity of God Who reveals Himself; and, on the other hand, on the supernatural light which enlightens the human soul, and elicits its act of faith. Nevertheless, Divine Authority must not be entirely passed over in the enumeration of the sources of knowledge; for, in studying the "end of the act of the agent" we are really on the boundary line between Logic and Philosophy, and, as in studying Philosophy it is of the utmost importance that we should keep well before our minds its relation to Divine Revelation, we must know the leading principles that refer to Divine Authority as a source of knowledge.

The **truths** of which we become cognizant by means of Revelation are of two kinds, or rather belong to two classes of subjects, viz.:

(*a.*) Supra-rational truths, or—as they are called —mysteries, which as such transcend the natural comprehension of human reason, and can never be either discovered or demonstrated solely by its means, *e.g.*, the Trinity, the Beatific Vision after death, etc.

(β.) Truths which are *per se* truths of reason, and can be known and proved as such, *e.g.*, the wisdom and goodness of God, the Creation of the world, etc.

It is obvious to say that for the first of these two classes of truths Divine Revelation is an absolute necessity, if we are to know them at all; for such knowledge will not come through any other channel. Reason tells us, it is true, that God as the infinite and eternal Truth can and must contain within Himself truths unattainable by our limited human reason; but this clearly involves the corollary that, if we are to know such truths, Divine Revelation is absolutely necessary for our knowledge. For the second class, on the contrary, Revelation is not *absolutely* necessary, because the truths it comprehends could possibly be attained by unaided reason. Yet it is most certainly *morally* necessary; for their attainment by unaided reason is practically very difficult and in many cases as practically impossible. It demands much time and hard study; and, moreover, reason itself is in consequence of its natural narrowness and weakness liable to fall into error. Hence, if these truths were not in Revelation, they could only be known to few persons at the cost of protracted studious labour; and even then would be fragmentary; mixed up with error, and difficult to maintain; while to the mass of mankind they would be utterly unknown. If this is not to be, if the knowledge of these truths is to be offered at all, if they are to be free from any admixture of error, they must be directly revealed byGod Himself: therefore, as containing *them* in contradistinction to its other

supra-rational truths, Divine Revelation is at least morally necessary. For the full development of this point, see St. Thomas' *Contra Gent.* l. 1, c. 4.; and *Summa Theol.* p. 1, q. 1, art. 1; 2a 2æ, q. 2, art. 4. c., from which the passage just concluded has been taken in substance.

Of the **trustworthiness** of Divine Testimony, there is not of course, there cannot be the shadow of a doubt. If God vouchsafes to give us a Revelation, it follows as a matter of necessity that the truths revealed come from Him, and that He is the guarantee of their truth and the motive of their certainty because He Himself is absolute Truth Who cannot deceive or be deceived. Therefore we are bound to receive such truths unconditionally even when they transcend out rational powers. That they should intrinsically militate against reason, we have already shown to be an impossibility.[3] The duty of accepting Divine Revelation presupposes, however, two **conditions,** without which faith in revealed truths on Divine Testimony would be impossible. They are:

(*a.*) We must be quite sure that God *has* revealed Himself, *i.e.*, that there is a Divine Revelation. He, who offers us a Revelation from God, must unmistakeably prove his Divine mission, and in some way testify to the truth of what he offers as the Divine message. Such proofs usually consist of miracles and prophecy when a country first receives the Gospel tidings. In so far as the reason apprehends these or any other proofs which bring home to it the fact of Revelation, they become what are called motives of the credibility of Revelation.

3 P. 156.

(*β.*) The **integrity** of Revelation has to be proved, viz., that its matter is pure and unadulterated, and so neither distorted, mutilated, nor falsified; hence that there is a true interpretation of it for all persons and for all times. Now this can only be under one condition, viz., that it is confided to a single authority empowered to do all this for us. Hence, there must be a church established by God to be the depositary and guardian and interpreter of His Revelation, and for this end endowed with the prerogative of infallibility. Then the Church must be recognizable as such, *i.e.*, she must have such marks as will show her forth and prove her to be the true infallible Church established by God—*Ecclesia Dei.* And she has them. "She is *One*, she is *Holy*, she is *Catholic*, she is *Apostolic*." Proof of them would lead us beyond the domain of Logic; but it remains to be noted that, inasmuch as they are apprehended by the reason, they are to it the motives or means by which it recognizes and acknowledges the Church as true and her teaching as full and faithworthy.

The Sources of Knowledge as guarantees of Truth and motives of Certainty being Criteria of Truth *per quod*, lead up naturally to the consideration of the Criterion of Truth *secundum Quod.*

CHAPTER III.

V The criterion of Truth and principle of Certainty.
VI. Rules for attaining material truth of thought.

V. Criterion of Truth and **Principle of Certainty.** Though the sources of Knowledge are the channels of Truth and its guarantees, we cannot have passed them in review without freely owning that by themselves they are insufficient criteria of conceptual Truth. The senses one and all may be out of order, and their perceptions become in consequence occasions of intellectual error. Human reason and human authority are not infallible; and we all know by experience into how many errors they may be led by the influence of prejudice, of morbid imagination, of wrong teaching, and by the misdirection of a wayward or stubborn will. Beyond them then, we need a safer and more trustworthy measure, a criterion according to which—hence called *criterion secundum quod*—we may know whether the judgments we form in every sphere of truth (with one exception hereafter to be noted) are true or false. Hence the Criterion of Truth may be defined as, that according to which we distinguish the true from the false in our cognitions; or, the rule according to which the intellect *ought* to judge of all things.

The Sources of Knowledge give us the *grounds* for the truth of the cognition; by the Criterion of

Truth we should perceive whether these grounds make the truth of the given proposition perfect and certain, and therefore utterly exclude its contradictory. Hence, as finally producing certainty, the criterion of Truth is called the Cause or Principle of Certainty. It does not enter into the limits of the present work, to show why we cannot accept a criterion purely external, such as are proposed by Huet and Bautain, Lamennais, or Jacobi; or why the merely internal criterion as proposed by Descartes, Reid, or Kant is opposed to the teaching of scholastic philosophy; but it is necessary to remark at the outset that the subject of our present inquiry is not a simply *subjective* criterion, by which the individual intellect unfailingly assures itself of the truth of each and every one of its cognitions. To assert the existence of such a criterion would be to vindicate for the human race the gift of infallibility; and the logic of facts has as yet given us no reason for adding this article to our philosophical creed. But a criterion there is, mainly *objective*, the motive cause of all knowledge, the mother of science, the sole genuine fountain of true certainty; and this criterion, if it is to fit into its definition, viz., "the rule according to which the intellect *ought* to judge of all things," must be **Objective Evidence,** *i.e.*, the intelligibility of the thing; or—in more intelligible phraseology—the object of thought itself, which is, either mediately or immediately, so obviously presented to the understanding, that we necessarily judge the thing must be as it is, and cannot be other than it is. "Cannot be other than it is," is, however, a phrase

with at least two distinct shades of meaning. If the evident proposition is a necessary truth, the phrase of course is of universal application; if it is a contingent truth, the meaning is simply this, that it cannot in point of fact be otherwise in the given case and under the given circumstances.

Viewed with regard to the evident **truth**, Objective Evidence is of three kinds corresponding to the three kinds or degrees of certitude:

(*a.*) **Metaphysical**, *i.e.*, absolutely unconditioned; therefore eternal and unchanging; therefore absolutely excluding the possibility of its contradictory; therefore the property of truths which are supreme in the great hierarchy; therefore nearest to the throne of wisdom. Such, for instance, is the evidence for the great principle of contradiction—*the same thing cannot at the same time be and not be in the same relation.* It is so clearly intelligible that we cannot conceive the possibility of anything endangering its supremacy either in the past or in the future, in the actual, or the possible.

(*β.*) **Physical**, *i.e.*, conditioned by the Divine Will; therefore its contradictory is a physical impossibility. This evidence is biform in character: it either illumines a fact of nature as being a fact, *e.g.*, the magnet attracts iron, the ocean waters generally ebb and flow; or it illumines an event which is future, but which will take place according to the regular operations of nature, *e.g.*, there will be full moon on the 30th of this month, the thermometer will fall below 80° Fahrenheit next month.

(*γ.*) **Moral**, *i.e.*, conditioned by the human will; therefore its contradictory is only morally impos-

sible. This kind of evidence may likewise illumine things past or present, *e.g.*, St. Mary's Abbey, either a fact or the monastic home of Alcuin,—Paris is York, Capital of France; or things yet future, *e.g.*, the Pope will recover his temporal power. It is clear that, if Alcuin had been so minded, he might have done otherwise than accumulate his erudition as a monk of St. Mary's; that, if the men of the olden time had chosen differently, Paris might never have been built; and it is almost more clear that the assertion about the Pope recovering his temporal power depends for its verification on the free agency of many human wills.

With reference to its **intelligibility,** Evidence may be:

(*a.*) **intrinsic,** *i.e.*, when it is inherent in the proposition itself as an intrinsic truth, *e.g.*, the whole is greater than its part; here the intrinsic truth of the proposition is clear from simple comparison of the two concepts.

(*β.*) **extrinsic,** *i.e.*, when the proposition is evident, not intrinsically, but merely from the testimony to its truth of an extrinsic credible witness; such, for instance, as internal and external experience; *e.g.*, the proposition, "I exist," is evident from the testimony of self-consciousness. Truths, too, which come to us by way of authority, fall naturally into the category of propositions extrinsically evident. But we must make a distinction between the evidence of experience and the evidence of authority. Strictly speaking, this last does not make evident the thing testified, but the fact of our possessing intact the testimony of a witness, and the further fact of his

credibility: hence its name of evident credibility; *e.g.*, the conspiring evidence of human testimony tells me that William the Conqueror gained the battle of Hastings, that Cicero wrote *De Officiis*, that Xenophon wrote the *Anabasis*, and that there are vast prairies in America.

With regard to its **grounds** on the one hand, and on the other with regard to its **relation to the human intellect,** Evidence, again, is either

(*a.*) **immediate,** *i.e.*, when the intellect intues its truth, and hence has no need of argument; that is to say, the light of evidence shines out of itself on the mind of man, and compels assent. Such truths, to adopt the expression of Cardinal Pallavicino, "carry the testimony of their truth graven on their forehead," and comprise the immediately evident truths of the reason, *e.g.*, things which are double of the same are equal to one another, and the immediately evident truths of experience, *e.g.*, I exist, I think, there are solid bodies outside of me, &c. Hence we see that immediate evidence may be either intrinsic or extrinsic. By it are illuminated the great first principles, the fundamental truths which have been called the "buttresses of the temple of wisdom," and which, we have seen, serve as a *point de départ* for demonstration.

(*β.*) **mediate,** *i.e.*, when the evidence is made apparent either by induction or deduction. Truths only mediately evident are not at once evident in themselves, but their evidence is germinally included in other truths which are, *hic et nunc*, immediately evident to the intellect which has formed its judgment concerning them. Reasoning, we know,

developes implicit germinal evidence into explicit life; and so, with its object thus illuminated by the evolution of the light of evidence hitherto latent, the intellect assents. To what? To the conclusion of a syllogism either perfect or cryptical.

Though **Evidence** is primarily and **in itself objective**, yet **in a subsidiary sense** it has a **subjective** meaning; just as certainty, which is primarily subjective, is in a secondary sense objective. When an object shining with the light of intelligibility presents itself before the intellect, and awakens it to an act of adhesion, to an assent, or judgment, the concept or judgment is irradiated—so to say—with the shining brightness of the object, and is said to be itself evident. Hence the application of the term in common parlance, but it is at best only analogical.

While it is quite true to call the Criterion of Truth the Principle of Certainty, we must not infer, nay, we cannot infer that Objective Evidence is what *actually*, in the generality of cases, induces the intellect to assent, and determines it to pronounce a judgment. This is done by what is called the **formal object of certainty**, because it is *practically* the motive which determines the intellect to judge. It must not be confounded with the *material* object of certainty which, we have said or implied elsewhere, is the thing we know, or are certain about. Now, the motive which induces the intellect to pronounce its judgment differs in several respects from Objective Evidence, and so has no right to be taken for it, and called the Criterion of Truth, because: the inducing motive is something individual; it gives

the reasons why, *hic et nunc*, I judge this or that to be the case; it is subjective to *me;* it varies according to my nature, my interests, my preconceived notions; it may be perverted by my will, or by ignorance. Objective Evidence, on the contrary, is something apart from the individual; it gives the reasons why I *ought* to judge this or that to be the case; it is independent of all that affects the individual; it is something outside of me, though attainable by me. The one regards each special man; the other, a normal man such as he would be if he were perfect and not subject to error. The one gives me what satisfies my mind; the other, what satisfies the requirements of truth. In the *ideal* man the two would coincide; but we are unfortunately fallible, and are quite certain about a thousand things that are false—quite certain be it repeated, for subjective certainty in its wide meaning consists in the adhesion of the mind to its judgments without fear of error, and those judgments may be either true or false. Dr. Döllinger, for instance, professed himself quite certain that the dogma of Papal Infallibility was a modern invention got up at the Vatican Council. There was something which induced his intellect so to judge. What? His early prejudices, individual training, misinterpretation of facts, and possibly the love of being the head of a party. And so there is something which induces certain members of several modern governments to judge that children's brains should be worked at high pressure; Mr. Bradlaugh, that the common sense of mankind has gone astray in accepting as a truth the existence of God; Ingersoll, that mysteries

and Revelation *in toto* are an irrational myth. Yet the Objective Evidence of what all these people hold is *nil*. Hence, when we say that Objective Evidence is the universal rule of our judgments, we mean that it is the rule which *ought* to govern our judgments, not the rule which *does* as a matter of fact govern them from first to last.

That no false proposition can be really evident, is a necessary consequence of Evidence being the criterion of truth; how comes it then that the formal object of certainty induces me and the rest of fallible mortals to adhere tenaciously to false judgments on occasions? The answer gives the very ground of obstinate error, which is that we consider a proposition true and certain, which is not and cannot be evident. We do so, because we either lack the means to attain an evident cognition of the truth, and hold to, what under the circumstances, *appears* to be true, though it is not so actually, and then our error is what is called invincible; or our wills are perverted, and we stop short in our investigation of truth and our endeavours for its evident cognition, or else we voluntarily close our eyes to the light and cling to our false judgment in spite of our inability to deny the evidence for its contradictory; and then our error is known as vincible. But the fact of our having no evidence for it does not prevent us from thinking that we have. Indeed in most cases of error, probably, we are under the impression that there is adducible evidence for the false proposition to which we cling; we do not meet every day, though we do meet on some days, with certain creatures possibly

human who practically hold their *ipse dixit* to be the one criterion *per quod* and *secundum quod* they and the whole world ought to judge of all things. It is most common, on the contrary, for another set of dealers in positive assertions to support a false judgment on the plea that "it is evident." Evident, no doubt, they think it, either from their insufficient examination of the matter, or from their unwillingness to look at the subject in any other light than that of prejudice; but evident in *fact* it is not.

All that has been said of Objective Evidence as the Criterion of Truth refers, of course, to our judgments in the natural order, which do not include assent to the truths of Revelation. *They*, clearly enough, do not fall within the sphere of the Criterion of Truth which is Objective Evidence. Their criterion is Revelation itself; and, in the case of those truths of which we might have a fragmentary, unsatisfactory knowledge by means of human reason, but which are clearly and distinctly made known to us by Revelation, it is evident that Revelation is a much surer test than their Objective Evidence which is practically next to impossible to get at. Such truths are mainly religious and ethical. Hence the sphere of Evidence as the Criterion of Truth is limited to natural truths; but the sphere of Revelation as a Criterion is not absolutely limited to truths supernatural. Moreover, for purely natural truths Revelation is a kind of negative Criterion, for what is *actually* in contradiction to Revelation connot possibly be true; and so, when such propositions are met with, they may at once be rejected as false. The reason is that supra-rational can

never be at variance with rational truths;[1] *apparent* contradictions there may certainly be; but the more fully the light of reason is shed upon them, the more rapidly the misleading appearance melts away. One word of caution: a negative criterion is not a positive criterion, be it remembered; and it would be absurd to say that because some merely natural judgment does not contradict Revelation, therefore it is true.

But although the mysteries of our Christian faith and in general all Truths of Revelation are not intrinsically evident, they are nevertheless extrinsically evident, or rather evidently credible. For it is perfectly certain that Divine Authority is credible, because God is Truth itself—"the very Truth Who cannot deceive or be deceived;" and it can be proved to demonstration that He has really revealed Himself to us, and that the Church—Christ's Changeless Bride without spot or wrinkle—is the infallible depositary and interpreter of Revelation; and this we have already seen to be evident credibility;[2] hence the truths of Revelation are extrinsically evident in the secondary sense of the word (q. v.), or evidently credible. Now *because* they are only evidently credible, the assent of Faith is and always will be a *free act*, which it is possible to withhold. Intrinsic evidence *constrains* the intellect to judge one way or another when it happens to coincide with the formal object of certainty; when it does not coincide with the power which induces

[1] See St. Thomas, *Contra. Gent.* l. 1, c. 7.; In l. Boeth. *De Trin.* q. 2, art. 3.

[2] See St. Thomas, in lib. *Sent.* 3, dist. 24.

assent, it has no influence whatever on the judgment or next to none. But, with regard to truths that are only evidently credible to it, the intellect is only *under the necessity* of accepting them in so far as it has no rational ground upon which to base assent to their denial. This necessity is indirect rather than direct, and so is in no sense unconditioned; for it really is the will which determines the intellect to assent to and accept revealed Truth. Hence, though Faith is certainly an intellectual act, it is so only inasmuch as the intellect is determined by the will to assent; and hence too is Faith a free act.[3]

If the question of Certitude and Conceptual Truth has been treated more fully than may at first sight appear consistent with the plan of the present volume, the reason must be sought for in the importance of the subject. Its relation to philosophy is not only initial but fundamental. More than this, to use the words of "Balmez," in this foundation of the scientific edifice, if examined with attention, you will see the whole edifice traced out. It is a plane on which are projected in a very visible manner, and in beauteous perspective, the whole solid structure which it has to support.[4]

From what has been advanced, finally, we are now in a position to draw definite conclusions, based on motives "just, useful, and necessary, delightful and easy," and applicable to every mind which, at the threshold of knowledge, asks itself—"what must I do, and what must I avoid, if, in the labyrinthine windings on the vast tracks opening before me, I

3 See *Summa Theol.* 2a. 2æ, q. 1, art. 4.
4 *Filosofia fundamental*, c. 1, n. 2.

am to attain Truth and true Certainty?" These conclusions are the

VI. Laws on which depends the Material Truth of Thought, or the rules we must observe if we would ensure the material truth of our cognitions. Of these laws the three principal are of a **theoretic or speculative** character, and so form a class distinct from those that may, by way of distinction, be called **practical.**

The laws of the first or **speculative** class are:

(1.) To assure ourselves of the material truth of a proposition, it must, if not immediately evident, be proved, and proved in such a manner that the grounds of its truth are drawn from the source of knowledge to whose sphere it belongs.

(2.) A proposition must only be accepted as true when it has, by means of these grounds, become objectively evident; for, from a strictly logical point of view, a proposition that is not objectively evident cannot be received as true.

(3.) If a proposition is not to be accepted as true unless it is objectively evident, so—on the other hand—when an evident proposition has been received as true and certain, it cannot logically be matter for further doubt, though we may have occasion to restrict our acceptance of it within certain limits.

As a foil to the sweeping character of these three rules—which obviously do not apply very closely to the ordinary run of practical life—it may be noted that, in order to prevent the danger of our ascribing objective evidence to a proposition which has none, particularly in the higher order of truths that border upon or even pass into the supernatural, it is well to

ascertain that the proposition in question is not in contradiction with Revelation.

The laws of the second or **practical** class are;

(1.) To lay aside preconceived notions or prejudices, which are a veritable and prolific source of error. The way to do this, is to examine them dispassionately and critically, sitting in honest stern judgment over our own selves, and not to shrink from throwing overboard our prepossessions and foregone conclusions if they prove to be false. Prejudices are of many kinds, and arise from many causes; but this is not the place for their examination.

(2.) Not to be guided in our thoughts and inquiries by mere feeling, nor to allow ourselves to be under the dominion of any passion; for by unsubdued passions and unruly inclinations the will is perverted; and most errors are caused by a perverted will, which leads the understanding into false ways, and compels its assent to what is false by blinding its sight to the light of truth. So, if we would seek truth *to find it*, we must keep ourselves free from passion, and prosecute our search with a sincere and earnest good will.

(3.) To avoid one-sidedness and narrowness in our studies. It often happens that when study is confined to one sphere of truth, or to a single science, other truths and sciences are in consequence undervalued, and this frequently leads to a denial of their truth. We cannot see what lies beyond our little circle; and, because we cannot see it, we will not admit its truth. Such one-sidedness is, to say the least, a sign of eccentricity and conceit,

and always make a man ridiculous. But it is a malady of other departments of thought as well as of what is technically called study; and everywhere it is an enemy to the attainment of truth. Like the people under the dominion of prejudice or of perverted will, narrow-minded folk shut the door—so to say—in the face of truth; and among them are usually to be found believers in the myth of personal infallibility, and certain self-constituted judges in Israel, whose judgments of their fellows lack faith in good intentions, and charity of interpretation.

(4.) Not to lay aside—in practice at all events—the study of Logic. To do so would be to lay ourselves open to the danger of accepting unproved assertions for proved propositions, taking ridiculous fallacies for legitimate arguments, and utterly misconceiving the matter in hand. This does not mean that we are never to lay aside the study of the technicalities of Logic; nor that dexterity in the application of what may be called the framework of merely Formal Logic constitutes a good reasoner, any more than an abiding sense of the dry rules of grammar constitutes a good writer; but it does mean that we should never fail to apply the rules of Logic, mainly the rules of Method and Material Logic, to cases that demand accuracy and exact thought. This is not done by certain young scribblers of both sexes, for instance, who occasionally undertake to publish papers on subjects of which they do not fully know the meaning and scope; hence cannot divide into natural parts, or support by congruous arguments; while they seek to cover their ignorance or mental slovenliness by

rhetorical figures, poetic phraseology, light-heeled comparisons, etc., to the mental detriment of readers who have not sufficient critical acumen to reject the gilded bauble.

(5.) Not to shirk the labour of thought; we often consider a proposition true, and deem it unnecessary to trouble ourselves further about its proof, when, if we looked at it more closely, we should see that it was by no means evident. Resulting from a form of mental indolence, which may be described as habitual passivity of thought, this habit of taking in ready-made views, and submitting without effort to the ideas set before it, is in its very nature inimical to the earnest search after truth, which is ever on the alert to examine, discriminate, compare, pursue, and judge for itself. Not inconsistently, minds that are strangers to the patient labour of studious thought, and like to be fed as children are fed, are not unfrequently smitten with the plague of "viewiness." And this from the very nature of the case. Because they do not take the trouble to think a thought right through for themselves; because they have little, if any care to discriminate the true from the false in the omniscient utterances of periodical literature, they are able, at a moment's notice, to retail from these questionable sources of knowledge views on all subjects from pre-historic man to the cause of the latest abnormal sun-spot, from the utility or non-utility of philosophy to the last speculation of Barnum. Do these viewy dogmatisers minister to the interests of Truth?

(6.) To observe a determined order and method in study. If we study in a confused mixumgatherum

sort of fashion, our brains will be "all abroad" in a hopeless haze, where—if we may trust the teachings of experience—false impressions and errors of all kinds grow into convictions without restraint. Order in study both presupposes and strengthens some kind of general order in reading, and so preserves the mind from the enervating habit of dipping into multitudinous books without aim or purpose,—a habit not to be named in the same breath, though unfortunately sometimes confounded by the thoughtless with a direct minister to truth, viz., Catholicity of taste in literature.

(7.) Not to allow the imagination too much play. Unless this naturally unruly faculty be kept well in hand under the discipline of reason, it will lead us into all manner of blunders; for it has the unfortunate propensity to bring before the intellect, and often determine it to regard as true, things exaggerated and distorted out of all resemblance to their supposed original in the sober land of facts. Quite as necessary is honest self-judgment in restraining the vagaries of the imagination, as in dismantling the mind of prejudices.

(8.) Not to allow ourselves to be deceived, on the one hand, by mere words and phrases; or to be led astray, on the other hand, by excellence of style. Empty verbosity is one of the literary plagues of the day, and newspapers and periodicals of all classes save the highest, are largely infected by it. When an objection cannot be answered, when an argument cannot be met, when an assertion is not quite to an opponent's taste, and in many other like cases, a brilliant saying, a witty repartee, a party

watch-word, declamatory abuse, sometimes even grandiose twaddle suffices to lay waste the interests of truth, and override its supporters. A like effect may be and often is produced by the influence of a good style; for a reader may be so captivated by the graces of elegant diction and the beauty of its ornaments, as to overlook the inaccuracy of the facts and arguments, and so be led to yield his assent to error. Hence the necessity of judging of things in their real nature and just relation to one another apart from the use of language; and this will be secured by confronting high-sounding, clever, positive, or wordy phrases, or by divesting ourselves of the prejudice in his favour with which an author's style may have inspired us, as the case may be, in order to get to know the exact meaning of the assertions claiming assent, and then to test them by proof. The result of such an examination shows but too often that they are all but meaningless, or else the mask of error.

When we consider how important it is, with respect both to our temporal and eternal interests, to be sure of the truth of our knowledge, and how momentous are the consequences of error both to individuals and to mankind in general; we cannot fail to acknowledge ourselves obliged to strive to secure mental accuracy, and hence to observe the rules laid down by Logic for this end in the interests of Truth.

As a set-off to all this dogmatism, however, it must be remarked that the rules enumerated, and all the strong things said about accuracy apply to the earnest investigation of Truth, which in some

one of its many forms enters into the duty of nearly every life. But there is no intention whatever of depreciating the mental pleasures, which may not lie strictly within duty's range, and yet be necessary for the mind's relaxation. It is the tendency of some hard students to think that "all work and no play" does *not* make "Jack a dull boy." But this is generally a mistake, proved to be such by the inexorable logic of facts. And so, after pouring out the vials of wrath upon desultory reading and study, the illogical productions of certain budding scribblers, the kaleidoscopic pictures of the imagination, and the brilliant sayings and excellence of style, which are not always enlisted in the service of truth; it is only fair to add that—considered *in themselves*—all these things are very far from useless. When the mind is out for its holiday, when it is weary and unfit for hard work, they help to restore its tone, and—by preparing it to resume its study of Truth with renewed vigour—are, like many other things not calling for mention here, indirectly ministering to its acquirement. But—do not let us mistake them for the direct road to it; or our certainties will not be the certainties of truth, the certainties of which St. Thomas says: "Certitudo, quæ est in scientia et in intellectu, est ex *ipsa evidentia* eorum quæ certa esse dicuntur."

QUESTIONS.

I. 1. Name any two of the six definitions of Logic.

2. Contrast one full definition with one that applies only to Formal Logic.

3. What is the purpose of Logic?

II. 1. What must there be in order to answer this purpose?

2. How does this tell upon the division of Logic?

3. Distinguish (a.) Material and Formal, (b.) Natural and Artificial Logic, and show by some comparisons the relation between Artificial and Natural Logic.

III. 1. Prove the necessity of Logic, and give an authority for this proof.

A.

I. 1. Why is man called a rational animal?

2. Why do we say that the soul "informs" the body?

3. What sort of a substance is the soul? Can it act independently of the body?

II. 1. Distinguish the three classes of human powers.

2. In virtue of what connection does each class belong to the soul?

III. 1. What are the three powers of the intellect or understanding?

2. What is the function of each?

IV. 1. What do we understand by the term, "action of the intellect?"

2. Explain how ideas are formed, and then clearly distinguish the **sensus intimus** and the **species intelligibilis.**

3. What is the process of putting together two ideas called?

Give (a.) a positive, (b.) a negative illustration from any of the following ideas: **history, art, Euclid, instructive, interesting, puzzling, sky, water, mountains, green, blue, cloudy, misty.**

4. Explain the process of reasoning, and illustrate it by two original examples.

5. What is the difference between speculative and practical reasoning?

6. Are the following examples speculative or practical:

(a.) Any one who would work that sum correctly, must have a knowledge of decimal fractions;
But I would work that sum correctly;
Therefore I must have a knowledge of decimal fractions.

(b.) All stars shine;
Sirius is a star;
Therefore Sirius shines.

(c.) A piece of furniture is held together by the forces of adhesion and cohesion;
But my desk is a piece of furniture;
Therefore my desk is held together by the force of adhesion and cohesion.

7. What is the end of reasoning? What is meant by the Logical or Rational Order?

B.

II. 1. In what relation do terms and propositions stand to Formal Logic?

2. What is the relation of reasoning to Formal Logic?

III. 1. Of what are terms and propositions the respective signs?

IV. 1. Define **term** (a.) taken absolutely, (b.) in relation to propositions.

2. Name the terms in the following:

Time flies;

"True, 'tis pity; pity 'tis, 'tis true;"

"His life was gentle;"

"This was a man."

V. 1. Distinguish (a.) simple and complex, (b.) absolute and relative, (c.) abstract and concrete terms.

2. To what classes does each of the terms in the following sentences belong:

"This is not my writing,
Though, I confess, much like the character."

"Slips of yew
Silver'd in the moon's eclipse."

Mothers love their children.

Duty before pleasure.

3. Why are genus, species, difference, property, and accident, called universals? Define, and give an example of each.

4. Name some universal and some equivocal terms, and say why they are so?

5. In what senses is the word analogy used? Which is the more usual meaning?

VI. 1. Why is a proposition called an "interpretation?" What do propositions unite or separate?

2. What is the "form" of every proposition?

3. Resolve three original propositions into subject, nexus, and predicate.

VII. 1. How would you recognize a categorical, causal, hypothetical, disjunctive proposition?

2. Pick out of the following list of propositions those which are (a.) universal; then, in succession, those which are (b.) particular, (c.) negative, (d.) hypothetical, (e.) disjunctive:

If the barometer rises, it will not rain. Water seeks its own level.

Most farmers are confirmed grumblers.

The most convenient books are octavos or duodecimos.

If we examine our own cognitional powers, we shall be able to get a clear idea, though not of course perfect knowledge, of the impassable abyss that separates us from all the lower animals.

Light cannot reach us from Sirius in less than fifteen or twenty years. Sirius is either a white, or yellow, or red, or blue, or purple, or green star.

Antares is a red star with a greenish scintillation.

If orbits of suns, like orbits of planets, are ellipses, our sun will curve away sideways long before he reaches the constellation Hercules.

"One touch of nature makes the whole world kin."

"If it were done, when 'tis done, then 'twere well
It were done quickly."

Every free and independent nation may claim the right to a native literature.

Supposings have to give in to facts.

No milkmaids like smoky slums.

If Telemachos dismisses his mother from his home, her Erinuës will come upon him.

3. Examine any five propositions in the foregoing list, and point out the subject, copula and predicate in each.

VIII. 1. In how many ways may propositions be equivalent?

2. Prove by examples that a true equivalence is to be found in each of these ways.

3. Find an equivalent of each kind for the following propositions:

"All our yesterdays have lighted fools the way to dusty death."

"All occasions do inform against me."

Every reader must be struck by the recurrence of the Phœnician name.

"All the tree-tops lay asleep,
Like green waves on the sea."

"He prayeth best who loveth best."

"This seraph-band, each waved his hand."

4. Opposition is the contrast or diversity existing between certain propositions; examine the following pairs, and state why opposition may be found in some, and why not in others:

(a.) All astronomers call Antares "the Sirius of Red Suns;" some astronomers do not call Antares the "Sirius of Red Suns."

(b.) Vega, Altair and Regulus shine with a brilliant white light; Aldebaran and Pollux are ruby red.

(c.) All rules have exceptions;

No rules have exceptions.

(d.) Some astronomers are perplexed.

Some astronomers are not perplexed.

(e.) All Jupiter's four moons travel round him at different distances;

The sun and the planets do not travel round the earth.

5. Re-examine the pairs of propositions, in which opposition exists; and say what is the kind of opposition in each.

6. What is the difference between contradictory and subaltern, contrary and sub-contrary opposition? Exemplify your explanation in each of the following propositions:

All men learn the rudiments of knowledge upon faith.

"All literatures are one; they are the voice of the natural man."

Many men are men of one idea.

Everything unsymmetrical was intolerable to Goethe.

Every star is in motion, hurrying along in space. Some move faster; some move slowly.

7. Why cannot (a.) two contradictory, (b.) two contrary propositions, both be true at once? Can (a.) two contradictories, (b.) two contraries both together be false?

8. May (a.) two sub-contraries, (b.) two subalterns both together be true? Prove your answer by an example of each.

2. Two sub-contraries cannot both together be false; why not?

Illustrate what you have said by an example.

10. May the truth of the subalternant proposition be inferred from the truth of the subalternate? If so, why? If not, why not?

May we infer the truth of the subalternate from the truth of the subalternant? Why; or why not?

Can we from the falseness of either subalternant or subalternate infer the falseness of the opposite proposition?

11. Distinguish the propositions called convertend and converse; and explain the two kinds of conversion.

12. Convert the propositions.

Honesty is the best policy.

Algol is not Arcturus.

Some stars are variable.

The "Prentice's pillar" is in Roslin Chapel.

All dictionaries are books.

13. "All gold is ductile." What can I infer from this proposition about things which are not ductile? What do I learn about things which are not gold?

14. Does a true convertend ever give a false converse? Does it ever give a true one?

Does a false convertend always give a false converse? Give an example.

15. How far can we infer truth or falseness, in

conversion of propositions, from the truth or falseness of convertend and converse?

16. From the following examples, show how the conversion of propositions leads from the Matter of Formal Logic to its Form:

The length of Westminster Abbey is five hundred and five feet.

The G.C.M. of 160903 and 66429=1. $9 \times 2 = 18$.

All flowers are beautiful.

All planets shine by reflected light.

IX. 1. What is the Form of the "act of the agent?" How is it treated of?

IX. 1. Examine the three definitions of a syllogism; then state how each one is exemplified in the following:

A rigidly disciplined mind never forgets that in physical science our data are very small considering the huge system of things they have to account for;

But Onesimus has a rigidly disciplined mind;

Therefore Onesimus never forgets that in physical science our data are very small considering the huge system of things they have to account for.

2. A very heavy man on earth would be a most light and active individual on Mars;

James is a very heavy man on earth;

Therefore James would be a most light and active individual on Mars.

Examine the above syllogism; then answer these questions:

(a.) Which is the middle term?

(b.) How do you know it to be the middle term?

(c.) Which is the major term? Why?

(d.) Which is the minor term? Why?

(e.) Which is the conclusion?

(f.) How do you know it to be the conclusion?

(g.) What are the two other propositions called? Why?

(h.) What is the name of the proposition containing the major term?

(i.) Distinguish extension and intension; and illustrate the distinction by circles.

3. Examine the following syllogism; then answer the same questions:

All dogs are animals;

Pilot is a dog;

Therefore Pilot is an animal.

4. What is the difference between the material and formal truth of a syllogism? Are they necessarily united? What is meant by a conclusion being true *per accidens?*

5. "It is impossible to deduce error from truth." Show how this axiom applies to the syllogism.

6. Do the following examples prove anything you have stated about the material and formal truth of the syllogism? If so, what?

(a.) Every planet is a heavenly body;

But my spinning-top is not a planet;

Therefore my spinning-top is not a heavenly body.

(b.) All poetry is elevating;

But the "Dream of Gerontius" is poetry;

Therefore the "Dream of Gerontius" is elevating.

(c.) Every man is a musician;

But Cornelius is a man;

Therefore Cornelius is a musician.

(d.) All ships are water-craft;
But the *Bellerophon* is a ship;
Therefore the *Bellerophon* is water-craft.

XI. 1. What is the main rule concerning the Matter of syllogisms?

2. On what two principles or canons do the right rules for the Form of the Syllogism rest?

3. How many terms are there in a syllogism? Why cannot there be more?

4. How many propositions must there be in a syllogism? Why not more?

5. Why should no term have greater extension in the conclusion than in the premisses?

6. What is meant by the middle term of a syllogism being distributed?

7. When and why must the middle term be distributed?

8. In which proposition must the middle term not appear? Why not?

9. Why is no conclusion obtainable when both premisses are negative?

10. What is the rule about two particular premisses? Give two reasons for this rule.

11. Why cannot a negative conclusion be drawn from two affirmative premisses?

12. If one premiss be negative, what do you know about the conclusion? Why?

13. If one premiss be particular, what can you infer about the conclusion? Why?

14. What is understood by the figures and modes of the syllogism?

15. Explain how the middle term is not distributed in the following false argument:

The nature of a clock is to indicate the correct time;

To deviate from the correct time is the nature of a clock;

Therefore to deviate from the correct time is to indicate the correct time.

16. What rules of the syllogism are broken by the following false arguments:

(a.) Some planet has a system of rings and satellites;

But Mercury is some planet;

Therefore Mercury has a system of rings and satellites.

(b.) The rose is a flower;

But the lily too is a flower;

Therefore the rose is the lily.

(c.) The study of modern languages is very useful;

But the study of philosophy is not the study of modern languages;

Therefore the study of philosophy is not very useful.

(d.) Some children are studious;

But some boys of seven are not studious;

Therefore some boys of seven are not children.

(e.) Constantine was probably born at York;

Constantine was a Roman Emperor;

Therefore all Roman Emperors were probably born at York.

(f.) Some astronomical terms are derived from the Arabic;

But equinoctial and amplitude are some astronomical terms;

Therefore equinoctial and amplitude are derived from the Arabic.

(g.) Some things attained without labour are valuable;

Some knowledge is attained without labour;

Therefore some knowledge is valuable.

(h.) No brutes are immortal;

No man is a brute;

Therefore no man is immortal.

XII. 1. Distinguish simple and compound syllogisms.

2. Why are the propositions forming categorical syllogisms called "propositions de inesse"?

3. From the following examples show how the first canon, which serves as a basis, for the rules of the syllogism, applies immediately to the categorical syllogism:

(a.) All Zulus are men;

But Cetywayo was a Zulu;

Therefore Cetywayo was a man.

(b.) No Saxon is a Hindoo;

But Witikind was a Saxon;

Therefore Witikind was not a Hindoo.

4. Explain how the *Dictum de omni, dictum de nullo*, is immediately resolvable into the principle of contradiction; and in your explanation introduce two original examples.

5. What are the parts of a hypothetical proposition? Upon what does its truth depend?

6. What is the relation between the middle and major terms in the major premiss of a hypothetical syllogism?

7. Upon what principle is the conditional form of the hypothetical syllogism based? Why?

8. Name the rules of the hypothetical syllogism. What results from these rules?

9. The terms of the rules may not be reversed: why not?

10. Show how the following arguments break these rules:

(a.) If he is guilty, he will like to hide himself;
But he does like to hide himself;
Therefore he is guilty.

(b.) If he is guilty, he will blush;
But he is not guilty;
Therefore he will not blush.

11. How does the first of the above arguments break the third rule of the ordinary syllogism; and the second, the second rule?

12. If the gardener has cut the flowers, I can fill the vases at once;
But the gardener has cut the flowers;
Therefore I can fill the vases at once.

Make the above argument into a categorical syllogism.

13. How do you recognize a copulative or conjunctive syllogism? Give an example of one.

14. What results from affirmation in the minor premiss of a conjunctive syllogism? For what reason?

15. Why cannot the terms of the second rule of the conjunctive syllogism be reversed? Prove what you say by an example.

16. Upon what principle is the form of the conjunctive and of the disjunctive syllogism based?

Explain this principle, and show how it is the basis of these forms.

17. Correct, or defend the following:

(a.) No one can at the same time study Greek and play cricket;

But Templeton is not studying Greek;

Therefore he is playing cricket.

(b.) Thetis could not be in the sea-palace with her thirty-three sisters and at the same time go to Olympus to procure arms for Achilles;

But she did go to Olympus to procure arms for Achilles;

Therefore she could not be in the sea-palace with her thirty-three sisters.

(c.) A triangle cannot be at once right-angled, obtuse-angled, and acute-angled;

But this triangle is acute-angled;

Therefore it can be neither right nor obtuse-angled.

(d.) No colour can be at once blue and yellow;

But this colour is not blue;

Therefore it is yellow.

18. What is the difference between the conjunctive and disjunctive syllogism?

19. What is the relation between the major and middle term in the major premiss of the disjunctive syllogism? Illustrate what you say by two examples.

20. Name the chief rule of the disjunctive syllogism, and state the necessary conditions implied in that rule.

21. Distinguish between the application of the rule to syllogisms in which the disjunctive major

has only two members, and to syllogisms in which the disjunctive major has more than two members.

22. When may the terms of the rule be reversed? When not? Why not?

23. Correct or defend the following, showing where they do, or do not obey the rule and conditions of the disjunctive syllogism:

(a.) A crime, as recognized by law, is either treason, or felony, or misdemeanour;

But forgery is neither treason nor misdemeanour;

Therefore it is felony.

(b.) A delta may be either a lake delta, an inland sea delta, or an ocean delta;

But the delta of the Nile is an inland sea delta;

Therefore it is neither a lake delta, nor an ocean delta.

(c.) Flowers are valued either for their beauty or for their scent;

The lily of the valley is valued for its scent;

Therefore it is not valued for its beauty.

(d.) Melodies are either in a major or minor key;

This melody is not in a minor;

Therefore it is in a major key.

(e.) Non-electors at parliamentary elections are either aliens, or persons convicted of forgery in a court of law, or juniors, or commissioners of stamps, or their employés, or employés in the General Post Office, or police constables, or persons in some other way disqualified;

But Pericles von Thränenberg and Honoré Guizot are employés in the General Post Office;

Therefore they are neither aliens, nor convicted of forgery in a court of law, nor juniors, &c.

(f.) Sirius is either a white, or a red, or a yellow, or a blue, or a purple star;

But Sirius is a yellow star;

Therefore neither red, nor yellow, nor blue, nor purple.

24. What is the general rule for testing the validity of compound syllogisms? Give the reason for the rule, and show by examples how it applies to each kind of compound syllogism.

XIII. 1. Distinguish (a.) Incomplete and (b.) Extended syllogisms; and say why they are sometimes called "forms of argument akin to the syllogism."

2. What kind of syllogisms are the following? Expand each into a formal syllogism.

(a.) Mars is a planet because it moves round the sun.

(b.) It is freezing hard, therefore we shall go out skating.

(c.) Ralph gets on well with his lessons because he is clever and studies hard.

(d.) There will probably be rain this afternoon because the clouds are low and heavy, and the wind is veering to the south.

(e.) I have not written my Latin exercise, therefore I shall get a bad mark.

(f.) Frank has broken his arm, so he cannot attend the gymnastic class this morning.

3. Reduce the following syllogisms to the form either of enthymemes or of contracted syllogisms:

(a.) Nothing that has extension is indivisible;
But everything that has length has extension;
Therefore nothing that has length is indivisible.
(b.) No simple essence is mutable in its nature;
But some substance is mutable in its nature;
Therefore some substance is not simple essence.
(c.) All metals are minerals;
But all metals are bodies;
Therefore some bodies are minerals.
(d.) His father lived in Keswick;
But he lived with his father;
Therefore he lived in Keswick.
(e.) All matter is divisible;
But that which is divisible is finite;
Therefore matter is finite.

4. What is a polysyllogism? An epichirema? A sorites? A dilemma?

5. Distinguish between a "pure" and a "mixed" polysyllogism. Why is the syllogistic series, to which a polysyllogism is reducible, sometimes called a "perfect polysyllogism"? When is the polysyllogism generally employed?

6. Resolve the following epichirema, which is employed by Cicero, into its component syllogisms; and say whether you consider it a conclusive argument:

If a man can be suspected of parricide, he must be otherwise most wicked, because it is a fearful crime;
But Sextus Roscius is not most wicked, because he is neither audacious, nor luxurious, nor avaricious;
Therefore he cannot be suspected of parricide.

In what circumstances is the epichirema often used?

7. On what does the formal truth of the sorites depend? Convert any polysyllogism into a sorites. In what do these two forms of argument differ?

8. Why is the dilemma called a "horned syllogism" and the "deadly weapon of argument"? What rules must be observed in every good dilemma? In what way is the strength or weakness of a dilemma proved?

9. Examine each of the following extended syllogisms; name the kind of each; then resolve it into simple syllogisms:

(a.) If schools are without Christianity, education will be without Christianity;

If education is without Christianity, the people will be reared without Christianity;

If the people are reared without Christianity, they will become un-Christian;

If the people become un-Christian, they will become anti-Christian;

Therefore, if schools are without Christianity, the people will become anti-Christian.

(b.) Practice produces dexterity;

Dexterity works confidence;

Confidence banishes undue bashfulness and timidity;

The absence of undue bashfulness and timidity ensures self-possession;

Self-possession secures the full command of personal oratorical resources;

The full command of personal oratorical resources is the measure of attainable oratorical success;

Hence practice is the measure of attainable oratorical success.

(c.) The moon is a satellite;

But every satellite is a planet;

Therefore the moon is a planet;

Planets shine by reflected light;

Therefore the moon shines by reflected light;

That which shines by reflected light is not self-luminous;

Therefore the moon is not self-luminous.

(d.) Doubt is an act of intelligence, for only an intelligent agent can doubt;

But doubt cannot doubt the intelligence that doubts, since to doubt that would be to doubt itself;

Therefore universal doubt is an impossibility.

(e.) This prisoner's challenge to the jury is unavailing, because

It is either a challenge peremptory, or a challenge *per causam;*

If it is a challenge peremptory, it is unavailing, for he is charged with misdemeanour, and in cases of misdemeanour, there is no peremptory challenge;

If it is a challenge *per causam;* it is unavailing, for no reason can be given for the objection;

Therefore, whether peremptory or *per causam,* still the challenge is unavailing.

(f.) Whatever is, in any sense, is either necessary and eternal, or contingent and created;

If you say it is necessary and eternal, you say it is God, because the necessary and eternal can alone be absolute uncreated being;

If you say it is contingent and created, you still assert the necessary and eternal, because the contingent and created is neither possible nor intelligible without the necessary and eternal;

Therefore whether you assert either necessary and eternal, or, contingent and created being, you always assert that God is.

XIV. 1. What kind of Truth has our study of Logic so far dealt with? Define that kind of Truth. 2. What is the next stage in our enquiry? Why? What relation does this stage bear to the end of Logic?

XV. What is method? In what relation does it consider thought? What are its functions?

XVI. Name the division of method, and the reasons for it.

2. What part of Method regards objective Truth *as a whole?* Why?

XVII. 1. What do you understand by definition? How is the meaning of the term seen in its derivation?

2. What terms include widely every kind of definition? Why?

3. What is the difference between nominal and real definition?

4. Enumerate the different kinds of nominal definitions; then examine the following, and specify the kind of each:

(a.) Light is that medium by which we see the colours and shapes of things.

(b.) a comet is a hairy star.

(c.) a telescope is that with which we can see from afar.

(d.) This is a copy of *The Stones of Venice*.

(e.) This is the *Contemporary*. Those are copies of *Aletheia*, and the *Formation of Christendom*.

(f.) An ephor is an inspector.

(g.) The moon is a heavenly body that shines and gives light by night.

5. Clearly distinguish the descriptive, genetic, and essential definition; showing in what they agree, and in what they differ.

6. Why is essential definition the only satisfactory kind of real definition? Why is it called conceptual definition?

7. What is the difference between a metaphysical and a logical definition? In what do they agree? What are matter and form?

8. Why must proximate genus and ultimate differentia form the components of every logical definition?

9. Why may an essential definition be considered a sort of compendium of our knowledge of a thing?

10. Explain how and why definition is limited (a) from above, (b.) from below.

11. What things cannot be defined? Why not? What two genera divide all being? How?

12. How is definition perfected?

13. Give an original example of each kind of real definition, and your reason for forming it as you do.

XVIII. 1. What is meant by a definition being (a.) adequate and exclusive, (b.) short and exact or distinct?

2. Why should a definition be (a.) clearer than

the thing defined, (b.) non-negative? When may a negative definition be legitimately employed?

3. Examine the following definitions; reject those which are faulty, and say *why* you reject them; if after this any remain, distinguish them severally as descriptive, genetic or essential, and say why you have done so; (a.) "A strong dilemma is a desperate case."

(b.) Calomel is dichloride of mercury.

(c.) An interpreter is one who interprets.

(d.) A euphemism is a rhetorical figure by which a delicate word or expression is substituted for one which is harsh or unseemly.

(e.) Man is his Maker's "chief delight and favour."

(f.) The *Tis* was the public opinion or public judgment of the Homeric world.

(g.) "A thing of beauty is a joy for ever."

(h.) A pen is an instrument made to hold fluid ink, and to spread it over paper.

(i.) Cheerfulness is the bright weather of the heart.

(j.) Astronomy is a science which treats of the solar system.

(k.) "Virtue is voluntary obedience to truth."

(l.) Courage is not boldness, it is not audacity, it is not impunity, it is not assurance; it is not daring: it is that quality which enables men to encounter danger and difficulty firmly and fearlessly: it bears a generic relation to bravery, intrepidity and heroism; and a specific relation to fortitude.

(m.) Light is produced by wave-like motions in a highly elastic medium which pervades all space.

(n.) He was a man, take him for all in all,
See what a grace was seated on this brow;
Hyperion's curls, the front of Jove himself,
An eye like Mars, to threaten and command;
A station like the herald Mercury
New-lighted on a heaven-kissing hill;
A combination and a form indeed,
Where every god did seem to set his seal
To give the world assurance of a man.[1]

XIX. 1. What is division? What is its relation to definition? What does every division connote?

2. Distinguish (a.) an actual, potential and moral whole; (b.) a physical, metaphysical and logical whole; (c.) partition, division in the strict sense of the term, and distribution.

3. What kind of wholes are the following: Virtue; confidence; beetle; chimpanzee: navy; House of Lords; desk; tree; flower; science; literature; rascal.

4. The basis of division may be either external or internal: when is it external? when internal? Illustrate your explanations by examples. Why may we have various co-ördinate divisions of the same whole?

5. Upon what principle are sub-divisions formed? What is their use?

XX. 1. Why is division of a whole into two species or classes only, the best means of ensuring the adequacy and exclusiveness of a division? Give any illustration not in the text.

2. What is meant by the co-ördination of the parts of a division, and by the parts mutually excluding each other?

[1] *Hamlet*, a. 1.

3. The division must be regular or orderly: illustrate the application of this rule.

4. What are the disadvantages of too minute sub-division?

5. Are the following divisions correct or faulty? Give the reason for your judgment of each one. (a.) "Marmion" consists of a prologue, six cantos, Sir David Lindesay's tale and l'envoi; (b.) That article runs over seven pages and two half-pages; (c.) Mivart's "Lessons from Nature" contain fourteen chapters, a starting-point and a postscript.

(d.) From a biographical point of view, history may be divided into the history of generals and the history of gamblers.

(e.) A sentence may be divided into words, letters, subjects, adverbs, predicates, nouns, adjectives, letters and stops.

XXI. 1. What is the office of argument? What is its end? Upon what does its value depend?

2. Name and distinguish the two great classes of arguments.

XXII. 1. What is Demonstration strictly so-called? How is it accomplished? 2. Show how all demonstration is based upon the axiom that "Truth contains nothing but the true;" and draw out the consequences of this statement.

2. Of what does the *matter* of Demonstration consist? What is meant by the "state of the Question?"

3. What is a *principium per se notum*, an axiom, a postulate?

4. What is the *Form* of Demonstration? Of what is it the basis?

5. Why is Demonstration essentially dependent upon the *principia per se nota?*

6. How is Demonstration limited from above and from below?

XXIII. 1. What is the rule for the thesis? When is an explanation of the state of the question invariably called for before beginning the argument?

2. What are the rules for the principle of demonstration?

3. What are the rules for the syllogism considered as part of the argument?

XXIV. 1. In direct opposition to all these rules are fallacies or sophisms; what are they? why are they treated of just after these rules? How are they classed?

2. Name the fallacies contrary to the rules of the syllogism, and say of each kind whether it is formal or material.

3. What is the fallacy of *Amphibology* or *ambiguity?* How can it be unmasked? In what does its inaccuracy consist? How do the following fallacies illustrate your answer:

(a.) He who sends forth a book into the light desires it to be read;

He who throws a book into the fire sends it into the light;

Therefore he who throws a book into the fire desires it to be read.

(b.) Bears and lions kill men;

The constellations Ursa Major, Ursa Minor and Leo are bears and lions;

Therefore they kill men.

(c.) Dogs bark;
Sirius is a dog;
Therefore Sirius barks.

(d.) "If thou never wast at court, thou never sawest good manners; if thou never sawest good manners, then thy manners must be wicked; and wickedness is sin, and sin is damnation. Truly, shepherd, thou art in a perilous state."[2]

4. What is the fallacy of *Composition and Division?* In what does its fault consist? How may it be unmasked? Prove what you have said from the following examples:

(a.) It is impossible for white to be black;
But this paper is white;
Therefore it cannot become black.

(b.) "Three and two are odd and even numbers;
Five is two and three;
Therefore five is odd and even."

5. Explain the fallacy of *Collective and Distributive meaning.* How does it violate the rules of the syllogism? How do I fall into this fallacy by concluding that, because the ministers in Cabinet Council came to a wise decision, therefore any one of them would have done so singly?

6. How do we pass from a "*dictum secundum quid*" to a "*dictum simpliciter?*" Why should we not do so? A lunatic would fall into this fallacy if he argued that I ought not to take his sword from him, because no man should withhold the property of another: where does the inaccuracy of reasoning lie?

7. What is the *fallacia accidentis?* Give two or

[2] *As You Like It*, iii. 2.

three examples, and show where the fault lies in each. The child of a soldier in the Scotch Greys infers that all horses are grey, or a Malay infers that all persons are yellow; why is each of these inferences a *fallacia accidentis?* How may this fallacy be unmasked?

8. When Ikon, the hero of Miss Giberne's charming instructive story, *Among the Stars*, argues that "winter has come because we have frost and snow," and that "Fritz knows a great deal about the stars because he has a telescope," what fallacy is he making use of? In what does this fallacy consist?

9. Tell me five or six ways in which the question may be evaded, and give an example of each. How is the question evaded in each of the following arguments:

(a.) "Human knowledge is at best only progressive," is the proposition for proof; and the points proved are, that there is no royal road to learning, and that all short schemes should be rejected as dangerous.

(b.) A boy under examination has failed in arithmetic; not to lose his marks, he argues that he has passed in algebra, and that the problems in algebra involve a knowledge of the arithmetical rules in which he has failed: why am I justified in witholding his marks?

(c.) A witness charged by counsel with being absent-minded, replied, "Impossible, for I am here present."

(d.) In proving that Mrs. Siddons was a good actress, why may I not argue that she was a good woman, as was actually the case?

10. What is the fallacy called *begging the question?* Name three ways in which it may be done; and show how each of the following is a *petitio principii:*

(a.) Anger is short madness, for everyone in a passion is temporarily insane.

(b.) History affords political wisdom because many statesmen have become wise by reading history.

(c.) We cannot possibly undertake to teach that the earth moves round the sun, for we have always held the opposite theory that the sun moves round the earth.

(d.) The end of the world must be very near, for things are so different from what they were when we were young, that it is hard to see how they could be worse.

11. Are the following examples of the *vicious circle,* or not? If so, in what does their inaccuracy consist:

(a.) I prove that the earth is round by the way in which ships gradually disappear when going out to sea; then I prove the cause of this manner of disappearance by the round form of the earth.

(b.) Some months ago, a journalist tried to prove that drunkenness is the cause of popular misery; and in the course of the same leader argued that popular misery is the cause of drunkenness.

(c.) We know that "*The life of a Prig,*" *by one,* is true, because it is a piece of autobiography written by one who could not be mistaken about the incidents of his own life, and we know that

it is an autobiography because the book tells us it is so.

(d.) Ernest is urged to go in for rowing because he must get strong; and his brother Arthur is urged to get strong because he must go in for rowing.

To avoid arguing in a circle, what caution must be observed in purely objective scientific arguments?

12. What is the fallacy of *False Generalization* or *Invalid Induction?* Give an example: How many forms has this fallacy? What are they? Examine the following, and show how each is an instance of False Generalization:

(a.) I have just had a rocking-horse given me; now my father rode on his horse from Bath to Wells yesterday, right over the Mendip Hills: I'll do the same to-morrow on my rocking-horse.

(b.) A little girl, who plays the part of a fairy-queen at Drury Lane, argues that, because the gold and stones in her stage crown are mere tinsel and glass, therefore all royal crowns are valueless tinsel and glass.

(c.) Of a family of nineteen children, one boy is half-witted, and another is deformed; a rough and ready acquaintance leaps to the conclusion that all the nineteen are, from first to last, crazy either in mind or body.

(d.) Animals are irrational; therefore man, being an animal, is irrational.

(e.) More rain falls on the west than on the east coast of England; therefore more rain falls at Southport than at Yarmouth.

13. Whence the saying, "a fallacy is a nest of

fallacies?" In the division of fallacies, why do not the parts of the division mutually exclude each other?

14. State what fallacies you can detect in each of the following arguments; and say of each whether it violates rules for the syllogism, or the thesis, or the ground of demonstration:

(a.) Stars are bright because they shine; and they shine because they are bright.

(b.) "If that is good enough to be put in a book, it is good enough for you and me."

(c.) Obedience to authority is according to nature; but disobedience to authority is according to nature; therefore obedience to authority is disobedience to authority. Obedience to authority, being according to nature, is from God; therefore disobedience to authority, being according to nature, is from God.

(d.) Cows have crumpled horns; the moon is not a cow; therefore the moon has not crumpled horns.

(e.) The British army abandoned Kassala; but Sir Evelyn Wood is in the British army; therefore Sir Evelyn Wood abandoned Kassala.

(f.) Any cat has one tail more than no cat; but no cat has two tails; therefore any cat has three tails.

(g.) No timepiece can go on a frosty night, because my timepiece has stopped twice on frosty nights.

(h.) Writing ought never to be acquired, because by its means men have committed forgery.

(i.) He who pursues nothing but pleasure cannot

be happy; for it is in the nature of things that, if we give ourselves up exclusively to one pursuit, it becomes wearisome.

(j.) The kingdom of Anarchia is in distress because it is badly governed; hence every distressed kingdom is badly governed.

(k.) Inferring from the conduct of his creditors that all men are bad, Timon of Athens argues:

> All is oblique:
> There's nothing level to our cursed natures
> But direct villany.

(l.) The *minimum visibile* is the least magnitude which can be seen; no part of it alone is visible, and yet all parts of it must affect the mind in order that it may be visible; therefore every part of it must affect the mind without being visible.

(m.) I am offered a reward to assist this man in gaining an office he desires; to assist a man is to do him good, and no rule of morality forbids the doing of good; therefore no rule of morality forbids me to receive a reward for assisting this man in gaining the office he desires.

(n.) Ingersoll asserts the eternity of the universe; proof of his assertion he gives none save that it is "according to my idea."

(o.) The blind cannot read; you cannot read in the dark; therefore you are blind.

XXV. 1. By what is the division of the kinds of Demonstrative Arguments determined?

2. Explain and distinguish the arguments called *a priori* and *a posteriori*. How do their names indicate their nature? Give an example of each. Which

kind is mainly used in experimental science, in mathematics, in historical criticism?

3. Of the following arguments one is *direct*, the other is *indirect*: tell me why they are so respectively; and in your answer show the nature of each, and the difference between them:

(a.) No stone is a living being;
But every man is a living being;
Therefore no man is a stone.

Your opponent denies the conclusion on the plea that, as the arboreal ancestor of our race was an apelet, it may equally well be affirmed that the apelet's ultimate progenitor was a stone; so you reply:

(b.) Certes, no stone is a living being;
But some men are stones;
Therefore some men are not living beings, which is absurd.

Distinguish the relative value, force and use of the indirect and direct arguments.

4. Give an example of an *argumentum ad veritatem* and of an *argumentum ad hominem*. Why are the former called *objective* or *absolute*, and the latter *subjective* or *relative?* What is their respective value? When is the use of subjective arguments never admissible? What is meant by arguing *ex concessis?* What is retorsion?

5. What are (a.) *Progressive* and *Regressive* arguments, (b.) *Main* and *Subordinate* arguments. Adduce an example of each.

6. What is the popular distinction between *Deduction* and *Induction?* Why is it faulty? Why is it incorrect to identify Deduction and Demonstra-

tion, and to consider Induction a form of reasoning altogether distinct from demonstration?

7. What is (a.) the wide, (b.) the exact meaning of *Deduction?* What is its most general formula? The following are examples of deductive arguments; show how they are so, and trace the *a posteriori* element in each:

(a.) Every corporeal substance has in itself quantity and force;

But every atom is a corporeal substance;

Therefore every atom has in itself quantity and force.

(b.) All good men are estimable;

But some good men are not esteemed;

Therefore some who are not esteemed are estimable.

8. What is the (a.) wide, (b) the exact meaning of *Induction?* Name its formula; and, from any example, trace the *a posteriori* element in induction.

Why is complete induction practically impossible? Why is it useless? How far is it necessary to carry incomplete induction in any given case? Upon what axioms is it based? For what reason? Why are the principles contained in these axioms universal and necessary? In what circumstances and by what is this universality and necessity conditioned? Prove that an inductive argument is essentially demonstrative.

What rules should be observed in inductive arguments? Give a reason for each rule.

An inductive argument, because it is a logical argument, is beyond a doubt in logical form: prove how this is the case (a.) in complete, (b.) in incom-

plete induction. What right have we to make use of the suppressed premiss in induction? Prove how in induction we are really reasoning about universals throughout, although we are said to proceed from the particular to the universal. How can you meet the difficulty that an induction is an invalid syllogism, because the conclusion has greater extension than the premisses?

What is the value of induction in science? Why? How far is induction a method of everyday reasoning? Why may not induction be applied to facts of the moral order?

9. What are Probable Arguments?

XXVI. 1. Explain what is meant by an argument from *Analogy*. Distinguish its three kinds. Why are these arguments not demonstrative? Upon what does their degree of probability depend? What is their use? Examine the following; name the kind, and say what you think of the force of each, supporting your opinion by reasons:

(a.) For a transitory gain men labour and toil; much more therefore should they labour for an eternal reward.

(b.) Springs are little things, but they are sources of large rivers; a helm is a little thing, but it governs the course of a ship: so, therefore, are words and looks, which are little things, powerful for good or evil.

(c.) The author of *Antoine de Bonneval*, thus supports the proposition that differences of mind as well as likenesses contribute to the charm of free colloquial intercourse: "As in music, so is it likewise in discourse. There are in the first, not

only recurring octaves, that ring out to each other immediately in clear response, but also deflections, regular intervals, and subtle gradations from key to key, and approaches to actual discord, that mingle and intertwine to perfect the melody in its progress. So, too, in the intercourse of one thoughtful mind with its fellow, it is as much the evolving of differences, salient but not irreconcilable, demanding energy of argument to sustain, and breadth and reach of thought to test them, that make the charm of free discourse, as thoughts that actually chime together, and conclusions which have been reached by a similar process of reason."

(d.) The safety of that upper storey has been secured by its timber beams; therefore it will remain secure when they are replaced by iron.

(e.) If the "Masters in Israel" speak such things; therefore may we, insignificant mortals.

(f.) As the tongue is like a race-horse, which runs the faster the less weight it carries; so, therefore, can those who talk on trifles speak with the greatest verbal fluency.

2. What is an argument from *Congruity?* What is its use,—its form,—its scientific value?

3. Answer the same questions regarding *Hypothesis.* What is a *theory* in science? What conditions must be observed in every argument from hypothesis?

XXVII. 1. What is scientific knowledge in relation to demonstration? What is in its subjective aspect? Why does it mainly regard the *causes* of the thing known?

2. Causes are of four kinds: name and explain

each kind; then give an illustration embracing all the four.

3. What have causes to do with scientific knowledge considered objectively? Why is scientific knowledge essentially *system?* Prove now how it is the result of method.

4. St. Thomas says, "there are three, and three only requisites for science:" what are they? What connection is there between them and the twofold description of scientific knowledge?

5. Why must the first principle of any system be true? What would result from starting from a wrong point, and using a wrong method? What is the "right place" of any part in a system? Nothing unproved may be admitted into a system: why is every *lemma* an exception to this rule? What are corollaries? Why are they admitted unproved?

XXVIII. 1. What is the difference between the material and formal object of a science? Illustrate the distinction by an example.

2. What is meant by the *subordination* and *superordination* of the sciences? What is the ground of this gradation?

3. Metaphysics is supreme among sciences: why? What is its subject-matter? Why is not this supremacy assigned to Dogmatic Theology?

4. Explain the term *subalternation* of the sciences. What makes some sciences subalternate, and why? Give some examples.

XXIX. 1. What is (a.) the theoretic, (b.) the practical end of Knowledge?

2. In what sense is it true to say that philoso-

phical or scientific knowledge is its own end? For what reason? How does subjective knowledge and its subjective end connote Truth and Certainty?

C.

What is the "end of the act of the agent" in Logic? In treating of it how many and what things have to be considered?

I. 1. In what does the *material* truth of thought consist as distinguished from its *formal* truth? Why is it called *conceptual* truth?

2. How far does conceptual truth represent the object of thought?

3. What is material error?

4. Why and how does material truth reside primarily in the judgment, and not in simple apprehension?

5. Explain how the same thing happens with respect to error; and say why error is called assent to a false, or dissent from a true proposition.

6. Why are there necessarily many classes of conceptual truth? Distinguish supra-rational and rational truths, and illustrate the distinction by examples. Why can supra-rational truths never be contrary to reason? What do you understand by saying that they are either negatively or positively according to reason?

7. What is (a.) a necessary, (b.) a contingent truth? When is a truth (a.) absolutely, (b.) hypothetically necessary?

8. Distinguish and give examples of truths (a.) *a priori* and *a posteriori;* (b.) analytic and synthetic; (c.) ideal and experimental; (d.) mathematical,

metaphysical, and physical; (e.) moral and religious; (f.) theoretical and practical.

II. 1. What is *ignorance* with regard to truth?

2. What is (a.) objective, (b.) subjective *doubt?* What is its cause? How is it stated by St. Thomas? How does that statement indicate two kinds of doubt?

3. Distinguish objective and subjective *opinion.* Give St. Thomas' statement of the latter. Explain the cause of opinion, as a mental state; and give some examples of it.

4. What is objective *certainty?* Why must it be synonymous with truth? What is subjective certainty or certitude in its restricted and in its wide meaning? What is its object, according to St. Thomas? Why is subjective certainty in its wide meaning not necessarily conjoined with truth?

5. Explain how ignorance, doubt, and opinion are attitudes of the mind with respect to error as well as with respect to truth?

III. 1. Explain shortly the kinds of objective certainty, *i.e.*, certainty considered as a quality of propositions.

2. How may subjective certainty, *i.e.*, certainty considered as a state of the mind, be either metaphysical, physical, or moral? Give examples.

3. Why is it true to say that subjective certainty may, and must admit of degrees?

4. What is the difference between (a.) natural and scientific, (b.) natural and supernatural certainty.

5. If I am certain of the following propositions, what kind of certainty have I in each case:—Venus is not inhabited by human beings; two and two

are four; the sun will rise to-morrow; Ireland will eventually become prosperous; the lime-trees will be in full leaf in two months.

6. I am certain that the Second Person of the Blessed Trinity became Incarnate: that Jerusalem was destroyed by the army of Titus; that the flowers I have just put into water will be faded in two days; and I am certain, after working out the problem, that in equal circles, equal angles stand upon equal circumferences, whether they be at the centres or circumferences:—what kind of certainty have I in each case?

IV. 1. What is the twofold signification of a "source of knowledge"? What, their twofold character?

2. Name the sources of knowledge. What points form the subject of our inquiry in treating of each one?

3. What is *internal experience*, or *self-consciousness?* Whence does it result? What truths do we get to know by its means? Name the reasons for its trustworthiness.

4. What is *external experience?* Upon what does it depend? What objects do we come to know by its means? In what relation? Upon what two conditions does the report of the senses depend? Upon what conditions does the trustworthiness of their report depend? Why cannot the trustworthiness of the senses, as a source of knowledge, be matter for doubt, if these conditions are present?

5. Why is *Reason* called a source of knowledge? Why and how is it twofold in this character? What is the *discernment or light of reason* considered

as a source of knowledge? Mark a distinction in the light of reason similar to that in subjective knowledge. What are the truths cognized by this means? Show to what extent its testimony is trustworthy.

6. What is *common sense?* Prove that it is a form, or rather an exercise of reason. In what does it differ from the exercise of the discernment or light of reason? What kind of truths come to us by way of common sense? Enumerate some of them. What are the conditions which ensure its trustworthiness? Given these conditions, why is its trustworthiness beyond doubt?

7. From what does *Authority*, as a source of knowledge, proceed? What is faith as the correlative of authority? Upon what does faith depend as a ground for certainty? What is (a.) a witness, (b.) testimony? What truths do we get to know from *human authority?* What is the value of dogmatic testimony as a motive of certainty? What is its value as an instructor? Give some examples.

8. What is the office of historical testimony? What are its three channels? Its trustworthiness depends primarily on the credibility of the witnesses, and this in its turn depends on certain conditions: what are they? Upon what does the integrity of human testimony depend? What are the ordinary grounds for belief in human testimony?

9. Is *Divine Authority* a natural source of knowledge? Is the knowledge of Revelation natural or supernatural knowledge? Why? Why is it necessary to consider Divine Authority among the sources of knowledge? What classes of truths do

we know by its means? How far is Revelation a necessary medium for the knowledge of each class? What guarantee have we of the trustworthiness of Revelation. The duty of accepting it presupposes two conditions: what are they?

V. 1. Why are the natural sources of knowledge insufficient criteria of Truth? What further criterion is needed? Why?

2. This criterion cannot be simply subjective: why not? What *is* the *Criterion of Truth?* Think over the definition: then explain *how* the Criterion is mainly objective, and in some measure subjective.

3. Distinguish and illustrate metaphysical, physical, and moral objective evidence. Then distinguish (a.) extrinsic and intrinsic, (b.) immediate and mediate objective evidence. What is the subjective meaning of evidence?

4. Does objective evidence *actually* induce the intellect to assent, and determine it to pronounce a judgment in the generality of cases? What does? Why so? Distinguish it from objective evidence. Give some examples.

5. Can false propositions ever be evident? How comes it then that we consider them so?

6. Is Objective Evidence the Criterion of Truth for the Truths of Revelation? What is? For what natural truths is this criterion a safer one than objective evidence? Why is it a negative criterion for all natural truths? Why is the assent of faith always a free act?

7. Why is the question of Conceptual Truth and Certitude of such importance?

VI. 1. Two classes of conclusions may be drawn

from its examination. Name those of the theoretic class, and show how they are the outcome of what has been said on Method, Truth, and Certainty.

2. What is the way to rid ourselves of prejudices? Why are the dominion of feeling and passion, and one-sidedness in our mental habits, inimical to the attainment of truth? How is the study of Logic conducive to its attainment?

3. A habit of shirking the labour of thought stands in the way of the attainment of Truth: why? Why is this habit often accompanied with "viewiness"? Method in study and reading, and control of the imagination minister to the attainment of Truth: why?

4. Verbosity and its contrary, excellence of style, are sometimes calculated to lead minds away from truth: why? and in what circumstances?

5. Why should we consider ourselves obliged to aim at securing mental accuracy?

6. Do all the foregoing rules apply to mental relaxation? In what measure does relaxation minister to the attainment of Truth? If we take them for the direct road to it, what will be the character of our certainties?

PREFACE

THE article on Logic which Professor Adamson contributed to the ninth edition of the *Encyclopædia Britannica* consists of a critical survey of the history of logical theory; its value is well known to philosophical students; and no apology is needed to justify its publication in separate form. It may be mentioned, however, that this publication was thought to be important at the present time, as the work was in danger of becoming less easily accessible owing to the issue of the eleventh edition of the *Encyclopædia*, in which it is not reprinted.

The manuscript of the article has been fortunately preserved — alone among the manuscripts of the author's published writings. It is much fuller than the printed article, a number of passages—some fifty in all—having been struck out by the editor with a view to economy of space. These passages affect both text and notes; they vary in length from a few words to whole sections; they vary also in importance; but the author's own opinion was that the value of his

work had suffered by their omission; and with this opinion I agree. In the present book these passages have been restored to their place, so that the article as it left the author's hands is now, for the first time, placed before the reader.

The manuscript bears no trace of the editorial blue pencil, and the original proof no longer exists: so that a doubt may arise as to whether any particular omission may not have been made by the author himself when he corrected the proofs. But it is clear, from a comparison of manuscript and print, that his proof-corrections were few and unimportant. No real difficulty, therefore, has arisen in deciding upon the restorations. The author's style was so concise that greater brevity could not be attained without sacrifice of the matter.

It should be borne in mind that the article on Logic was written and published in 1882. The supplementary articles, by which it is followed in this volume, are all contributions to the history of logic; but the first of these—that on Category, also reprinted from the *Encyclopædia Britannica*—dates from six years earlier; and only the last carries the story on towards a more recent development of logical theory. Readers of the author's works do not need to be reminded that his own point of view underwent modification, and that there are some things here which he might have expressed differently had he revised the work himself.

With the author's manuscript and printed copy before me, my own work as editor has consisted chiefly in selecting the material and seeing it through the press. Some omitted references have been supplied; a few slips of the pen or the press, formerly overlooked, have been corrected; unwieldy paragraphs have been broken up, and the punctuation has been simplified; but nothing new has been added to text or notes. I am responsible for the choice of a title.

It remains for me to express my grateful thanks to the Syndics of the Cambridge University Press for allowing the publication of the articles on Logic and on Category in the present form. For permission to reprint the critical notices from *Mind*, with which the volume ends, I am indebted to the kindness of Professor Davidson of Aberdeen, literary executor of the late Professor Bain.

W. R. SORLEY.

SHORT HISTORY OF LOGIC

I

PROVINCE AND METHOD OF LOGIC

1. Logic, in the most general acceptation of the term, may be regarded as the systematic study of thought. So wide a definition is certainly sufficient to comprehend all that may have been at various times included within the scope of logical doctrine, but in other respects it is of small value. For it seems essential that to any separate and independent theory there should be assigned a distinct province and a distinct method. But neither province nor method, as in any way special or peculiar to logic, is marked off by the above description. The terms *thought* and *systematic study*, indicating the object and method of logical treatment, might, even in similar combination, be appropriately used in defining, totally or partially, philosophic disciplines not generally viewed as synonymous with logic. They do not serve, therefore, to mark off logic from philosophy as a whole, which is unquestionably the systematic exposition of thought, nor from psychology, which includes

within its wider range what may well be described as the study of thought. That some more accurate discrimination of the province and method of logic is absolutely necessary will readily be granted; for, in default thereof, neither the extent of matter to be included within the study nor the peculiarity of the method by which such matter is treated can be determined. The boundaries of logic and its essential constitution must otherwise remain fluctuating and vague.

Preliminary queries of a similar kind are naturally encountered in the case of all other branches of human knowledge; and though it is to be acknowledged that many of the sharp distinctions by which one is differentiated from the other are provisional merely, and demand restatement when a somewhat higher point of view is reached, yet their necessity and utility must be allowed. The sciences are not advanced but retarded when their provinces are allowed to overlap and become indeterminate. There are two methods by which these preliminary questions are generally answered — two methods which in themselves express directions of human thinking and which have at all times occupied a remarkable place in the system of logic. We may refer either to the distinct characteristics of the matter to be treated, or to the essential features of the method of treatment. We may determine the province of a science either by external division, by classification of objects according to their prevailing resemblances and differences, or by internal definition, by exposition of the fundamental characters of the method employed in the science. By neither process, unfortunately, can an unambiguous answer be supplied, at least without much art, in the case of logic. Neither by classification of the sciences, and assignment of some specific place in the general hierarchy to

logic, nor by precise determination of the character of logical analogies as opposed to all other forms of study, can there be readily attained a definition, at once full and exact, of the system of logic.

2. The reasons for the manifold difficulties encountered in the attempt to determine accurately the province of logic, whether by reference to a division of the sciences or by precise definition of the essential features of logical analysis, are not far to seek. The systematic classification of the sciences is not the result of mere observation and comparison; the selection of the points of agreement and difference involves not only consideration of the contents of the sciences as empirically presented, but also certain leading principles or fundamental views, which are in essence of a philosophical character. According to the general conception of knowledge which in various kinds is manifested in the special sciences, there will be radically divergent methods of classification, and the province assigned to each member of the ensemble will, for the most part, have its limits determined according to the character of the general view adopted. Moreover, if any of the more prominent specimens of classification of the sciences be critically inspected, they will be found to presuppose a certain body of principles which are wider in scope than any of the special disciplines, and to which no place in the ensemble can be assigned. In short, a systematic distribution of human knowledge into its distinctly marked varieties rests upon and presupposes a general philosophy, the character of which affects the place and function of each part of the distribution.

Logic, as may readily be imagined, has therefore experienced a variety of treatment at the hands of systematisers

of scientific knowledge. It has appeared as one of the abstract sciences, in opposition to those disciplines in which the character of the concrete material is the essential fact; as a subordinate branch of a particular concrete science, the investigation of mental phenomena; as a nondescript receptacle for the formulation in generalised fashion of the method and logical precepts exemplified in the special sciences. By such processes no more has been effected than to bring into light, more or less clearly, some of the characteristics of the supposed science, without in any way supplying an exhaustive and comprehensive survey of its boundaries and relations to other branches of knowledge.

Thus, when logic is marked off from the concrete sciences and associated with mathematics in the most general sense, as the treatment of formal relations,[1] and further differentiated from mathematics as implying no reference to the quantitative character of the most general relations under which facts of experience present themselves,[2] there is certainly brought to the front what one would willingly allow to be a commonplace respecting all logical analysis, namely, that its principles are coextensive with human knowledge, and that all objects as matters of conscious experience have an aspect in which they are susceptible of

[1] As, *e.g.*, by H. Spencer, *Classification of the Sciences*, pp. 6, 12; H. Grassmann, *Die Ausdehnungslehre von* 1844 (1878), Einleitung, xxii.–xxiii.

[2] Logic and mathematics, under this view, may be regarded either as generically distinct—which is apparently the opinion of Spencer, H. Grassman, and Jevons—or as species of a more comprehensive genus, the theory of formal (symbolic) operations—which is apparently the opinion of R. Grassman (see his *Formenlehre*, 1872) and Boole (see his *Mathematical Analysis of Logic*, 1847, p. 4, and *Differential Equations*, 1859, chap. xvi., specially pp. 388, 389). An admirable treatment of that which is implied in Boole's method is given in Mr Venn's *Symbolic Logic*, 1881.

logical treatment. But no more is effected. It is still left to a wider consideration to determine what the specific aspect of things may be which shall be called the *formal* and be recognized as the peculiarly logical element in them. There may be selected for this purpose either the general relations of coincidence and succession in space and time, or the fundamental properties of identity and difference, or the existence of classes; but in any case such selection depends upon and refers to a theory of the nature of knowledge and of the constitution of things as known. In truth, the notions of *form* and *formal relations* are by no means so simple and free from ambiguity that by their aid one can at once solve a complicated problem of philosophic arrangement. To lay stress upon *form* as the special object of logical treatment still leaves undecided the nature and ground of the principles which are to be employed in evolving a science of form, and therefore leaves the logical problem untouched.

Still less satisfactory are the results when logic is regarded as in some way a subordinate branch of the psychological analysis of mental phenomena.[1] Neither the grounds on which such a classification rests, nor the conclusions deduced from it, seem beyond criticism. The simple facts that certain mental processes are analysed in logic, and that psychology is generally the treatment of all mental processes, by no means necessitate the view that logic is therefore the outgrowth from and a subordinate part of psychology. For it is clear, on the one hand, that logic has a scope wider than psychology, since in any sense of the term it has to deal with all the processes (or with some aspect of all the processes)

[1] For this extremely common arrangement, see Hamilton, *Lectures on Metaphysics*, i. p. 121-3; Ueberweg, *System der Logik*, § 6.

by which on any subject knowledge is formed out of disjointed or disconnected experiences. And, on the other hand, since the subordination of one science to another, as species to genus, is fallacious, unless the two agree in fundamental characteristics, the position so assigned to logic would imply that in aim and method it shall be essentially one with psychology, a position equivalent to the negation of logic as a separate and independent discipline.

It is not surprising therefore to find that, so soon as logic has been distinguished as arising from psychology, and so dependent on it, the peculiarity of its position and functions compels the recognition of its more general scope and the reduction of its connection with psychology to an amount small enough to be compatible with absolute independence. Strong reasons, indeed, may be advanced for holding that logic is entirely to be separated from psychology, as differing from it in aim, method, and principle, that logical analysis is generically distinct from psychological, and that the two disciplines, while connected as parts of the general body of philosophical reflection, hold to one another a relation the reverse of that commonly accepted.[1]

As to the endeavour to collect from consideration of the sciences in detail a body of precepts, the rules of scientific method, and to assign the systematic arrangement of such rules to one special discipline, called logic, it seems to stand on the same footing and to be open to the same criticism as the allied attempt to treat general philosophy

[1] It is to be acknowledged that most of the writers on logic who emphasise the connection of psychology with logic introduce distinctions equivalent to the remarks above made, but the grounds for such distinctions and the conclusions to be deduced from them are not generally brought into clear light.

as the receptacle for the most abstract propositions reached in scientific knowledge. There is a peculiar assumption underlying the supposed possibility of distinguishing between scientific method and its concrete exemplifications in the special sciences, and only on the ground of this assumption could there be rested the independence of logic as the systematic treatment of method. It is taken for granted, without examination, that the characteristic features of correct and well-founded thinking are palpable and general, and that we thus possess a criterion for marking off what is common to all scientific procedure from that which is special and peculiar to the individual sciences. An elaborate philosophic doctrine lies at the root of this assumption, and the position assigned to logic may easily be seen to depend, not on what is apparent in the argument, namely, comparison of the sciences with one another, but on what lies implicit in the background, the philosophic conception of the nature of scientific knowledge in general. Without reference to the ultimate philosophic view, no definite content could be assigned to logic, and it would remain impossible to distinguish logic from the sciences in detail.[1]

3. Thus the various attempts to define the province and functions of logic from general classification of the sciences, to define, in short, by the method of division, yield no satisfactory answer, and refer ultimately to the philosophic view on which classification and division must be based. A similar result becomes apparent when we consider the

[1] See, for a clear statement of this impossibility, Comte, *Philos. Positive*, i. 34, 35. Definitions of logic as theory of method, which are based on general philosophic views (*e.g.*, the definition by Sigwart, *Logik*, i. § 1), stand on a different footing, and are to be examined on different principles.

various descriptions of logic that have been presented as following from more precise and accurate determination of the essential features of logical analysis and method.

"The philosophical deduction or construction of the notion of logic presupposes a comprehensive and well-grounded view, whether of the nature and mode of operation of the human mind, a definite part of which falls under logical treatment, or of the problems and objects of philosophy in general, from among which in due order may be distinguished the particular problem of logic."[1] The most elementary distinctions, by means of which, in the ordinary exposition of logic, progress is effected towards an accurate determination of the province of the science, not only refer to some such ultimate philosophic view, but lead to the most diverse results, according to the peculiarity of the views on which they are based. Of these elementary distinctions the following are at once the more usual and the more important:—the distinction between the province of logic and the province of the special sciences, as that between general and special; the distinction between natural growth of knowledge, with its natural laws, and the normal procedure whereby grounded knowledge is obtained, with its normal or regulative principles; the distinction between knowledge as a whole and its several parts, immediate and mediate, with restriction of logic to the treatment of all or portion of mediate knowledge; the distinction between the constituents of knowledge as on the one hand given from without (in experience), and on the other hand due to the elaborative action of intellect itself. To one or other of these may be traced the common definitions of logic, and a brief consideration of their contents will be sufficient to show that they severally rest upon more or less

[1] Twesten, *Die Logik, insbesondere die Analytik* (1825), p. 2.

developed general philosophic doctrines, and that their significance for accurate determination of the field of logic depends not so much on what is explicitly stated in them as on what is implied in the general doctrines from which they have taken their rise.

The distinction of logic from the sciences, as dealing in the abstract with that which is concretely exemplified in each of them, is certainly a first step in the process of determination about which there can be little or no doubt. But it is only a step, and progress is not much advanced thereby. For, if the distinction remain vague, it is not sufficient to differentiate logic from many other disciplines, philosophical or philological, and if it be made more precise, the new characteristics will be found to involve some special view as to what constitutes the common feature in the sciences, and to vary with the possible varieties of view. As a rule, too, the added characteristics do not serve by themselves to mark off logical treatment as an independent kind of investigation. They are most frequently obtained by a general survey of scientific procedure. Thus it may be said that in all sciences there are implied clearly defined notions, general statements or judgments, and methodical proofs; logic, therefore, as the theory of the general element in science, will appear as the treatment of notions, judgments, and proofs generally, or in the abstract. If so, then, unless some implied principle further determine the course of procedure, logic would be regarded as a merely descriptive account of the parts making up scientific knowledge, and it would be not only impossible to assign to it an independent position, but hard to discriminate it from psychology, which likewise deals with the parts of knowledge.

If it be understood, however, or explicitely stated, that in

all scientific knowledge there is community of method, resting on common principles or laws of knowledge as such, then clearly not only the province of logic, as now made identical with the treatment of the essence of knowledge, but the special nature of the theorems making up the body of logic, must depend upon the general conception of knowledge with which the thinker starts. In the view of logic taken, *e.g.*, by Mill, the fundamental idea is that of *evidence*, under which must be included all the grounds for any judgment not resting on immediate perception. So far as verbal statement is concerned, the adoption of this as the root idea would not distinguish in any special way the treatment of logical problems resting on it; but in fact each problem is dealt with in accordance with the particular theory of what, from the nature of human knowledge, constitutes evidence. Logic thus involves, or in truth becomes, a theory of knowledge, and in the end, for general spirit and details of doctrine, refers to an ultimate philosophic view. There seems no escape from this conclusion. Start as we may, with popular, current distinctions, no sooner do logical problems present themselves than it becomes apparent that, for adequate treatment of them, reference to the principles of ultimate philosophy is requisite, and logic, as the systematic handling of such problems, ceases to be an independent discipline, and becomes a subordinate special branch of general philosophy.

The attempt to avoid this conclusion must of necessity take form in some discrimination of logic from other varieties which may with it be classed under philosophy in general, and such discrimination is usually effected by laying stress on one or other of the following characteristics.

(1) In the whole process of knowledge, it may be said,

we are able to distinguish and to regard in isolation the methods according to which, from a combination of various elements, cognition of things grows up, and the laws according to which these elements must be ordered, if our subjective consciousness is to represent accurately and faithfully the relations of things. The laws of knowledge—there being understood by knowledge the whole sum of mental determinations in and through which the world of external and internal experience is realised for us—are of two distinct kinds, natural and normal. For the treatment of the natural laws the most appropriate title is psychology; for that of the normal or regulative laws the title logic is peculiarly appropriate. By the one science knowledge is regarded in its relation to the subjective consciousness, as so much of what enters into and constitutes the world of inner experience; by the other knowledge is regarded in its relation to truth, to the objective system, as the means whereby, for theoretical or practical purposes, an orderly and verifiable conception of this system is realised.

A definite place seems thus secured for logic; but, if one may judge merely from the various attempts to expound the body of logical doctrines from this point of view, the characteristic feature is not yet sufficient to determine the boundaries of the science or the specific nature of its problems. In fact, the feature selected might be accepted as the distinguishing mark of logical science by writers who would include under that common title the most diverse matters, and who would differ fundamentally in respect to the treatment of isolated problems. The metaphysical logic of Hegel, the empirical logic of Mill, the formal logic of Kant, might all claim to be developments of this one view of the essence of logic. So wide a divergence is clear evidence that the criterion selected,

though possibly accurate, is not sufficiently specific, and that the interpretation of it, which in truth determines for each the nature and boundaries of the science, depends upon the view taken respecting knowledge as a whole in its relation to the objective order of experience, respecting the import of the so-called normal laws, and respecting the subjective elements supposed to constitute knowledge.

On all sides this particular definition of logic is beset with difficulties, which it cannot afford to dismiss by means of the simple demand that knowledge shall be accepted as somehow given. For, apart altogether from the danger that under so wide a term as knowledge many differences may be accommodated, it then becomes impossible to do more than treat in a quasi-empirical fashion mental facts, the nature and peculiarities of which are to be learned from some external source. In the later, more detailed examination of the view of logic here briefly described, it will be pointed out that the usual formula by which the several logical notions are introduced, viz., that their nature as mental facts is dealt with in psychology, from which logic borrows, is in fact much more than a formula. The logical peculiarities will be found to rest mainly upon the psychological characteristics as borrowed, while it is evident that no substantive, independent existence can be vindicated for a doctrine, the succession of whose parts and their essential nature are given externally.[1]

[1] The following from Drobisch's excellent work (*Neue Darstellung der Logik*, 3rd ed., 1863) will make clear the view commented upon. "Human knowledge is partly immediate, partly mediate. The former rests on given facts, whether of sense-perception or of consciousness, the latter on that which may be deduced by thought from these facts. . . . Thought may be the object of scientific treatment from a double point of view: first, in so far as it is an activity of mind, its conditions and laws may be investigated; second, in so far as it

(2) Some of the perplexities that arise when logic is treated as the theory of the normal laws of knowledge may be obviated by the current distinction between immediate and mediate knowledge. The normal laws of knowledge might be said to apply solely to the process of mediate cognition, and their final aim would be defined as harmony between mediate knowledge and immediate experience. In fact, however, little is gained by the employment of this new characteristic. It is difficult to distinguish with perfect accuracy between the two kinds of knowledge in question; it is impossible that the treatment of the logical problem should not depend entirely on the view taken as to the nature of that which differentiates mediate from

is the instrument for acquiring mediate knowledge, an instrument that may be used not only correctly but also incorrectly, and so may lead to true or to false results. There are therefore natural laws of thought and also normal laws, prescripts, rules, according to which it must be directed in order to lead to truth. The investigation of the natural laws of thought is a problem of psychology; the determination of its normal laws is the problem of logic. . . . The logical normal laws of thought are not to be discovered by mere observation, for it would then be impossible to decide whether the mode in which we ordinarily think is also valid; but they must themselves be proved by thought, and so be shown to be necessary, not capable of being other than they are. The warrant for both the thought that proves these laws and the laws proved by it, is to be found in the thorough harmony between the two. Logic thus presents itself as in no way a mere description and analysis of thought, a descriptive science, but as a demonstrative science" (§§ 1, 2, 3). So far, there is little to object to; but clearly the whole character of the science depends (1) on the significance to be attached to the fundamental term *thought*, and (2) on the limitations imposed on the conception of laws. It becomes necessary, then, for Drobisch, as for any logician, to define his point of view regarding thought; and the definition (§§ 4, 5) at once introduces the further discrimination of form and matter, a discrimination which determines the whole treatment of the forms of logical problems.

immediate knowledge. Whether we express this as thought or as belief, its nature then becomes the all-important factor in determining the course of logical treatment, and further progress will manifest divergencies according as stress is laid on the subjective characteristics of thought, the laws to which, from its essential nature, all its products must conform, or on the limitations imposed by principles which have reference to the most general relations of the things thought about. In the one case a formal logic, of the type commonly known as the Kantian, would be developed; in the other either an empirical logic, like that of Mill, wherein the nature of notions, propositions, and reasonings is considered from the point of view of the empirical conception of experience, or a transcendental logic, like that involved in the *Critique of Pure Reason*, or a metaphysical logic, like that of Hegel, or a mixed doctrine, like that of Trendelenburg, Lotze, and Ueberweg. In short, the general philosophic view of thought is that upon which the character of logic as a science rests.

(3) There has above appeared, incidentally, one of the most current methods of solving the logical problem, by procedure from the distinction between that which is given to the mind in knowledge, and that which is supplied by the mind itself. No distinction seems more simple; none is in reality more complex. The opposition on which, in its popular acceptation, it rests is that between the individual concrete thinking subject and the world of objective facts, existing, as it were, to be cognised. The full significance of such an opposition, the forms in which it presents itself in conscious experience, the qualifications which must be introduced into the statement of it that it may have even a semblance of reality,—these are problems not solved by

a simple reference to the distinction as existing. It may well be held that knowledge is, for the individual, the mode (or one of the modes) in which his relation to the universe of fact is subjectively seized, but it is not therefore rendered possible to effect an accurate and mechanical separation of knowledge into its matter and form. Even on lower grounds it may be held that by the employment of this criterion little or no light is thrown upon the logical question. For no determination is supplied by it of the universal characteristic of form as opposed to matter in knowledge, and a comparison of various expositions will show the most startling diversity of view respecting the nature and boundaries of the formal element in knowledge.

It is of course true that in one sense any scientific treatment of knowledge is formal. Our analysis extends only to the general or abstract aspect of cognition, not to its actual details. But we are not, on that account, dealing with the form of knowledge. So soon as it is attempted to define more accurately what shall be understood by form, then it is found that various views of logic arise, corresponding to the variety of principles supposed to be applied in the treatment of form. Thus the stricter followers of the Kantian logical idea, *e.g.*, Mansel and Spalding, recognise, as sole principles which can be said to be involved universally in the action of thought, the laws of identity, non-contradiction, and excluded middle,[1] and in their hands logic becomes merely the systematic statement of these laws, and the exposition of the conditions which they impose upon notions, judgments, and reasonings. Analytical

[1] "Logic," says Spalding (*Ency. Brit.*, 8th edition), "is the regulative theory of explicative thought"; "Logic," says Mansel (*Prolegomena Logica*, 2nd ed., p. 264), "is the science of the laws and products of pure or formal thinking."

consistency, *i.e.*, absence of contradiction, is on this view the one aspect of knowledge which is susceptible of logical treatment. On the other hand, the idea of a contribution furnished by the mind itself to knowledge may lead to a more concrete and yet not less exact system of the forms of knowledge, if there be taken into account the real character of the operation by which such contribution is made. Thus in the logic of Ulrici, from the view of thought as essentially the distinguishing faculty, by which definiteness is given to the elements entering into knowledge, there follows not simply an iteration of the principle that thought must not contradict itself, but a systematic evolution of the fundamental relations involved in the action of thought, in which the more specifically logical products, the notion, judgment, and reasoning, have a determinate place assigned to them.

Not only, then, may quite distinct provinces be assigned to logic by thinkers who start with the same idea of thought as contributing to knowledge, but, as may well be imagined, the treatment of special logical problems presents a most bewildering variety. The nature of judgment, the principle of reasoning, the characteristics of thought which is in accordance with logical rule, will be viewed differently according to the special interpretation put upon the functions of the subjective factor in knowledge. Here again we find that the really influential fact in the determination of the province and method of logical science is a general philosophic conception of knowledge or thought.[1]

[1] In Rosenkranz, *Die Modificationen der Logik abgeleitet aus dem Begriff des Denkens* (1846), a similar conclusion is illustrated by an elaborate classification of possible modifications of the view of logic. Compare also Braniss, *Die Logik in ihrem Verhältniss zur Philosophie geschichtlich betrachtet* (1823).

4. Although, then, it does not seem practicable to obtain, either by external division or by internal analysis, a clear and sufficient definition of the province and function of logic, there remains yet one method by means of which the desired end may be attained. It may be that the separation of logic from other philosophic disciplines has come about historically, and that the assignment to logic of a special body of problems and a special kind of treatment is due to the accidents of its development. We might therefore hope to gain from a comparative survey of the field of logic, as that has been historically marked out, some definite view not only respecting the specific problems of logical theory, but also regarding the grounds for the isolated treatment of them. That in the history of logic there should be found a certain continuity of doctrine and development may, however, be compatible with entire absence of a common body of received logical matter, and the result of an historical research may be little more than a statement of distinct conceptions regarding the nature and province of the science, leading to the inclusion of very distinct materials within its scope. It requires but a superficial investigation of that which at various intervals has presented itself as logical theory to arrive at the conclusion that the differences in general spirit and in the mass of details far outbalance any agreement as to a few detached doctrines and technical symbols.

If the survey were limited even to the period preceding the attempts at radical reformation of philosophy in general, and of logic as included therein, to the period in which the Aristotelian doctrines, as they may be called, formed the common basis of logical treatment, we should be able to detect differences of such a kind as to indicate radically distinct fundamental views. The scholastic logic, which,

even by itself, cannot be regarded as one theory with unimportant modifications, is most falsely described as Aristotelian. The technical terminology, the general idea and plan, and some of the formal details are certainly due to the Aristotelian analysis of reasoned knowledge; but in spirit, in ruling principles, and in the mass of details the method of the scholastic logic is alien to that of Aristotle. It will be shown later that the Aristotelian analysis is saturated with the notions and aims of the Aristotelian metaphysics and general theory of knowledge, and that on that account alone, apart from the introduction of many foreign ingredients, from Stoic, Arab, and Byzantine sources, into the scholastic system, an important difference must subsist between the original doctrine and that which presents itself as but its historical development.

Even more radical is the divergence of modern logic from the Aristotelian ideal and method. The thinker who claimed for logic a special pre-eminence among sciences because "since Aristotle it has not had to retrace a single step, . . . and to the present day has not been able to make one step in advance,"[1] has, himself in his general modification of all philosophy, placed logic on so new a basis that the only point of connection retained by it in his system with the Aristotelian may be not unfairly described as the community of subject. Both deal in some way with the principles and methods of human thinking, but as their general views of the constitution of thought are diverse, little agreement is to be found in the special treatment of its logical aspect. So when a later writer prefaces his examination of logical principles with the declaration that "logic is common ground on which the partisans of Hartley and of Reid, of Locke and of Kant, may meet and join

[1] Kant, *Kritik* (ed. Hartenstein), Vorrede, p. 13.

hands,"[1] we are not unprepared for the result that, with a few unimportant exceptions, his views of logical principle coincide with those of no recognised predecessor in the same field, diverge widely from either the currently received or the genuine Aristotelian doctrines, and lead to a totally new distribution, in mass and detail, of the body of logical theorems and discussions.

Such divergence is, indeed, most intelligible. If one reflects on the significance which would be attached in any one of these logical systems, of Aristotle, of Kant, of Mill, to the *universal* or universalising element of thought, and on the fact that such universal must manifest itself as the characteristic feature in all the important products of thinking, the notion, the judgment, the syllogism, the conclusion is inevitable that difference of view in respect to the essence must make itself felt in difference of treatment of details. The ultimate aim of proof, and the general nature of the methods of proof, must appear differently according as the accepted ground is the Aristotelian conception of nature and thought, the Kantian theory of cognition, or subjective empiricism.

If, adopting a simpler method, one were to inspect a fair proportion of the more extensive recent works on logic, the conclusion drawn would be probably the same,—that, while the matters treated show a slight similarity, no more than would naturally result from the fact that thought is the subject analysed, the diversity in mode of treatment is so great that it would be impossible to select by comparison and criticism a certain body of theorems and methods, and assign to them the title of logic. That such works as those of Trendelenburg, Ueberweg, Ulrici, Lotze, Sigwart, Wundt, Bergmann, Schuppe, De Morgan, Boole, Jevons

[1] Mill, *System of Logic*, i. p. 13.

(and these are but a selection from the most recent), treat of notions, judgments, and methods of reasoning, gives to them indeed a certain common character; but what other feature do they possess in common? In tone, in method, in aim, in fundamental principles, in extent of field, they diverge so widely as to appear, not so many different expositions of the same science, but so many different sciences. In short, looking to the chaotic state of logical text-books at the present time, one would be inclined to say that there does not exist anywhere a recognised, currently received body of speculations to which the title logic can be unambiguously assigned, and that we must therefore resign the hope of attaining by any empirical consideration of the received doctrine a precise determination of the nature and limits of logical theory.

5. In order to make clear the reasons for this astonishing diversity of opinion regarding the province and method of logic, and so make some advance towards a solution of what may well be called the logical problem, it seems necessary to consider some of the leading conceptions of logic, with such reference to details as will suffice to show how difference of fundamental view determines the treatment of special logical problems. In this consideration the order must be historical rather than systematic. Not, indeed, that it is needful, nor is it proposed, to present an historical account of philosophy at large, or even of logic in particular; our purpose is merely to disentangle and bring clearly forward the nature of the principles respecting logical theory which have served as basis for the most characteristic logical systems. Such an inquiry will not only assist in explaining the divergencies of logical systems, but throw light upon the essence of logic itself. Thus, for example,

a critical comparison of the Aristotelian and Kantian or Hegelian conceptions of the end, aim, and function of logic may be expected to bring forward in their most abstract form opposed, or at least varied, views of the nature of the subject, and to enable a well-balanced judgment to be obtained on the problem involved.[1]

In this historico-critical survey, the first section must naturally be devoted to a consideration of the Aristotelian logic. If it were intended to present a complete history, or abstract of a complete history of logic, it would doubtless be necessary to preface the treatment of that from which logic, as we know it, has taken its rise, by a notice of such speculations of a logical character as are to be discovered among Oriental systems. But, however interesting such an historic research might be, its results would have little or no bearing upon the special problems before us. Our notions regarding logic are affected by the Aristotelian analysis of the method of reasoning, and by such systems as have been developed therefrom, but have been modified, and are likely to be modified, in no way by any Oriental systems of a like kind. The records of Oriental attempts at analysis of the procedure of thought are of purely historic value, and may, for our present purpose, be disregarded.[2]

[1] For a notice of works on the history of logic, see note A, p. 164.

[2] For a notice of some of the more developed systems of Oriental logic, see note B, p. 165.

II

THE ARISTOTELIAN LOGIC

6. In a remarkable passage at the close of the tract called by us the *Sophistical Refutations*, Aristotle claims for himself distinct originality in the conception of subjecting to analysis the forms or types of argument. Something had been achieved in closely allied matters, in the analysis of rhetorical methods and grammatical forms; but, in the attempt to generalise and reduce to order and method the very substance of reasoning, nothing, according to this statement, had been effected, nor had the possibility of such reduction been seriously contemplated. "The system I have expounded had not been partially, though imperfectly, elaborated by others; its very foundations had to be laid. . . . The teachers of rhetoric inherited many principles that had long been ascertained; dialectic had absolutely no traditional doctrines. Our researches were long, tentative, and troublesome. If, then, starting from nothing, it bears a comparison with others that have been developed by division of labour in successive generations, candid criticism will be readier to commend it for the degree of completeness to which it has attained than to find fault with it for falling short of perfection."[1]

[1] The above translation, which is somewhat free, is taken from Mr Poste's edition of the *Sophistici Elenchi*, p. 95.

Although the specific reference in this passage is to the analysis of dialectical argument contained in the *Topica*, the same claim might with justice have been made in regard to the more extensive analysis of the forms of reasoning in general which makes up the substance of the other books of the *Organon*. There had been, prior to Aristotle, much discussion of problems that would under any view be included under the head of logic; but no systematic attempt had been made to analyse knowledge as a whole in its formal aspect, to throw under general heads or classes the types of reasoning, whether dialectical or scientific, and to exhibit the general relations in which the elements of all reasoning stand to one another. After Aristotle, it became possible to refer all such discussions to a common head, and to view them as component parts of one systematic doctrine. In a peculiar sense, then, Aristotle may be described as the founder of logical science.

The precise nature of the inquiries falling within the scope of the Aristotelian logic may receive some preliminary explanation supplementary to that which can only be given by a careful study of the chief theorems of the system, if there be taken into account (*a*) the advances towards a theory of logical method contained in the speculations of earlier Greek thinkers, (*b*) the classification of philosophic disciplines, which underlies the body of Aristotle's writings, and (*c*) the general conception of the matter of logical analysis which may be deduced from any special or incidental treatment of the question in Aristotle. Of these in order.

(a) *Logical discussions prior to Aristotle.*

7. The inquiries which find a place in the Aristotelian logic are all, in a large sense, problems of the theory of know-

ledge. They arise, therefore, only in connection with critical reflection on the nature, grounds, and method of knowledge. The earliest forms of Greek speculation, turning rather upon explanation of natural fact, being in essence attempts to reduce the multiplicity of known fact to unity of principle, contain, as a consequence, problems of a metaphysical character, which might involve problems of strictly logical character, but were logical only in potentiality. The difficulties with which the early Greek speculators were presented had at first an aspect which was metaphysical only. Not until these difficulties were transferred into the sphere of thought, with the consciousness, however undeveloped, of a possible opposition between the determination of things reached by immediate processes of thinking and the characteristics of thought when submitted to critical reflection, could problems of a distinctly logical character come forward for solution. Of all these metaphysical questions the most important centre round the fundamental opposition between unity of principle and multiplicity of fact, between the one and the many, an opposition which under varied forms presents itself at every stage in the history of philosophic speculation. It is, indeed, an abstract expression for the problem with which philosophy at all times has to deal, though, naturally, the formulæ under which it makes its appearance are determined by the more or less developed conceptions of the elements entering into it that may have been attained.

In the first period of Greek speculation, the problem presented itself in its simplest, most direct aspect, and, after a few rough attempts at a quasi-physical explanation of the genesis of many out of one, there come forward, as reasoned, ultimate solutions, the Eleatic doctrine that only

unity has real being, the Heraclitic counter-doctrine that only in change, in the many, is truth to be found, and the Pythagorean notion of number, harmony, as containing *in abstracto* the union of the opposites, one and many. No one of these philosophic treatments can be said to contain specifically logical elements, but they raise questions of a logical kind, and, especially in the records of the Eleatic views, one can trace a close approximation to the critical reflection which marks the transition to a new order of ideas. Results which in these systems are stated with metaphysical reference only, reappear with new aspect among the Sophists and the Socratic schools.

The transition stage, indeed, partly aided by the atomic separation of objective fact from subjective sense experience, is mainly the effect of the Sophistic and Socratic teaching. Socrates and the Sophists have this in common that both treat the fundamental problem of philosophy as it had been handed down with special reference to the subjective experience of the individual. In their conceptions of the nature of subjective experience they differ widely from one another, just as in aim, method, and principles both differ from modern views on the same question ; but in both is to be discovered the critical reflection on thought and its essence which marked a new stage of speculation and prepared the way for a fresh development of philosophical activity.[1] A brief indication of the logical

[1] It is an error to strain expressions which, with due qualifications, may be accepted as valuable. One meets repeatedly with the assertion that the characteristic difference between ancient and modern philosophy is that in the former the special problem of the theory of knowledge, the possibility of reconciling subjective thought with objective system of things, was not contemplated. In a certain sense this is true ; but, taken absolutely, it is both erroneous and misleading. The Sophistic discussions, the Socratic theory of the notion, the

elements involved in this new treatment of the problem will be sufficient. In the teaching of the Sophists generally is to be discerned the opposition between subjective reflection and objective fact; in that of Protagoras and Gorgias in particular there appear as problems of the theory of knowledge difficulties for the older metaphysic of Heraclitus and the Eleatics respectively. The Heraclitean principle of change is the general foundation for the doctrine that the momentary perception is the only fact of cognition, and upon it may be based the conclusions that all truth is relative to the individual state of the individual subject, and that judgment, as a mode of expressing truth, is a contradiction in itself.[1] Thus the extreme Heracliteans, as Cratylus, rejected the proposition or combination of words, as expressing a unity and permanence not to be found in things, and reduced speech to the symbolism of pointing with the finger. Less developed but not less clear is the connection between the brief sceptical theses of Gorgias and the Eleatic doctrine of unity. As knowledge was impossible on the Heraclitean view, since it implied a synthesis not discoverable amidst incessant change, so for Gorgias knowledge was impossible, since in the synthesis was

Platonic distinctions of reason, understanding, and opinion, the Aristotelian treatment of the principles of knowledge, of the universal, and of the opposition between science and opinion, are quite unintelligible except under supposition of some such distinction. The difference is not in the problem, but in the new conceptions of the nature of the elements, and of the method of solution which modern philosophy introduces into its discussion.

[1] However we may interpret the Protagorean maxim in relation to more modern conceptions, there appears no reason to doubt the historic accuracy of the connection indicated in the *Theætetus*, and in the fourth book of the *Metaphysics*, between the Heraclitean metaphysic and the Protagorean theory of knowledge.

involved an element of difference, multiplicity, not reconcilable with the all-embracing unity of things.

It is evident from the treatment of such views in Plato and in Aristotle, how many of the illustrations used in support of the general thesis depended for their apparent strength on neglect of some of the elementary conditions of thought, and how inevitably reflection upon these difficulties led to the construction of a theory of thought. The first outlines of such a theory are to be found in the Socratic principle of the notion (or concept, as we may call it, for the notion as viewed by Socrates is certainly the concrete class notion, the simple result of generalisation and abstraction), and to Socrates is assigned by Aristotle the first statement of two important logical processes—induction, or the collection of particulars from which by critical comparison a generalised result might be drawn, and definition, or the explicit statement of the general elements disclosed by critical comparison of instances.[1] In the Socratic teaching, so far as records go, no explicit reference was made to the problems in connection with which those processes are of greatest significance, but in the lesser Socratic schools on the one hand, and in Plato on the other, we find the new principle either brought to bear upon the old difficulties, or developed into a comprehensive method.

The Socratic concept contains in itself the union of one and many, but it is in nature subjective; it is a mode of knowledge. If, then, it be regarded as only subjective, the old difficulties reappear. How is it possible to reconcile, even in thought, an opposition so fundamental as that between unity and plurality? Must there not be a like irreconcilable opposition between the subjective counter-

[1] *Metaph.*, 1078b 27-29.

parts of these objective relations, between the individual notion, the atom of knowledge, and the proposition or definition? How, indeed, can there be a combination in thought of that which is in essence uncombinable? Whether we take Aristippus, who draws mainly for theory of knowledge on the Heraclitean-Protagorean sources, or Antisthenes, who leans towards the Eleatic, or the Megarians, who also, in accordance with the Eleatic thoughts, devoted chief attention to the polemical aspect of the theory, we find a set of problems appearing, the solution of which imperatively called for a theory of knowledge as the combination of one and many.

Perhaps the most interesting of these early thinkers, so far as the history of logic is concerned, is Antisthenes, whose extreme nominalism presents the most curious analogies to some recent logical work.[1] According to Antisthenes, the world of cognisable fact consists of combinations of elementary parts (πρῶτα). These πρῶτα appear in cognition as irreducible elements denoted by the simplest elements of speech, names. The name is the mark for the sense-impression by which each πρῶτον is communicated to us, for they are only known by sense, and are strictly individual. A composite thing is known through the combination of names of its parts, and such a combination (συμπλοκή) is a proposition or definition (λόγος). Each thing has its specific λόγος (οἰκεῖος λόγος), and a judgment is merely the expression of this. There is therefore no distinction of subject and predicate possible; even identical propositions, the only

[1] On Antisthenes, see the third part of the *Theætetus*, which appears, beyond doubt, to refer to him (comp. Peipers, *Untersuchungen über das Systems Plato's*, 1874, pp. 124-48), and Aristotle, *Metaphysica*, 1024b 32, 1043b 24; *Topica*, 104b 21.

possible forms under this theory, are mere repetitions of the complex name. Predication is either impossible or reduces itself to naming in the predicate what is named in the subject. It is the simple result of so consistent a nominalism that all truth is arbitrary or relative; there is no possibility of contradiction, not even of one's self.

The theory of Antisthenes, strange as it may at first sight appear, rested on certain metaphysical difficulties, which lie at the root of all the perplexity regarding the import of propositions, and it is not too much to say that these difficulties were kept continually in mind by Plato and Aristotle in their several attempts to explain the nature of knowledge. Both thinkers bring forward, from various fields, new elements which enter into the consideration of the problem, but both find themselves confronted with the ultimate question, What is the ground of unity in things known, and in what way does thought unite the detached attributes of things into a subjective whole? What is the nature of the unity which binds things, themselves in a sense units, into classes or wholes, and how comes it that in the judgment subject and predicate are, in a sense, set at one? The inquiry branches off in varied directions, into discussions on the universal and particular, on form and matter, on the unity of the definition, but nevertheless remains the one underlying difficulty for both thinkers.

In Plato, for whom the solution was found in the participation in or imitation of ideas by things, we find more distinctly conceived the series of logical processes involved obscurely in the Socratic method. So far as positive statements regarding the ideas can carry one, it may be said that in essence these processes concern only

the formation of or deduction from the concrete universal concept or general notion. The ideas, in the Platonic system, at least in reference to the thought which apprehends them, resemble most closely class notions. A deeper significance often appears to attach to the relative processes of *induction*, whereby the resemblances of things, the idea in them, is disclosed, *definition*, whereby the content of the idea is made explicit, and *division*, whereby the external connection of ideas with one another, their system, is deduced; but such significance attaches to the more purely metaphysical aspects of the theory, and had no particular bearing on the Aristotelian treatment of the same problems. Not much is given in Plato towards a theory of the proposition, though sometimes an analysis of its elements is sketched; and the method of division could yield only a few of the types of deductive reasoning.

But, over and above these more definite contributions towards the construction of a theory of knowledge, there are general aspects of the Platonic work of not secondary importance for the Aristotelian logic. In Plato the fundamental differences of earlier philosophic views appear in a new phase, and are elevated to a higher stage. Sophistic method is analysed, not as in forms actually existing, but in its essential features, and the opposition between sophist and philosopher is viewed as the opposition between opinion and knowledge. Heraclitean principle of change and Eleatic doctrine of unity are resolved into the more comprehensive opposition of the universal and the particular, while hints of an ultimate solution, of a universal which is at once and *per se* particular, are not wanting. The Socratic method of thought appears as that by which alone a solution of philosophic difficulties is to

be obtained, and the consideration of thought in its relation to facts is marked out for special investigation. A deeper view of thought was thus made at once possible and necessary.

(b) *Classification of Philosophic Disciplines.*

8. Much, then, had been effected by Aristotle's predecessors in the way of preparing a definite body of problems and a method of dealing with them, problems and method which might fairly be said to belong to a theory of knowledge as such; and, from the occasional references in the *Organon* to opinions of contemporaries, it is evident that many isolated attempts at solution of such questions were being carried on. In Aristotle we find a systematic examination of many of these problems, but it is left by him doubtful what place in the general scheme of philosophic sciences should be assigned to it. The distribution into physics, mathematics, and first philosophy, or the wider classification of doctrines as poetic, practical, or theoretical, in no way enables us to class logic or the body of speculations making up the *Organon*. That the forms of proof analysed in these writings are of universal scope is unambiguously declared; that the first principles assumed in all proof are dealt with in first philosophy is also made clear; but the relations between the two doctrines so reciprocally related cannot be determined from any statement made by Aristotle himself. That he should have regarded the inquiries of the analytics as propædeutic in character, and should have held that those who assume to discuss problems of first philosophy ought to have made themselves acquainted with the general theory of proof, is

intelligible; and more than this significance cannot, we think, be assigned to the passage in the *Metaphysics*, on the ground of which the logical inquiries have been classed as the general, common introduction to the whole system.[1] For the close connection between the analytical researches of the *Organon* and the inquiry into essence or being as such forbids us to accept, in any strict sense, a separation of these as forming distinct and independent sciences. To metaphysics is assigned the consideration of the principles of proof, and the kind of inquiry making up first philosophy is described by Aristotle in a fashion which assimilates it most closely to the researches of the analytics. That which is left undecided by the Aristotelian classification is the relation of the logical inquiries to the organic whole of which first philosophy is the main or sole part.[2] To obtain any fresh light we must turn to the consideration of indications supplied by Aristotle as to the nature of the inquiries grouped under the head of *Analytics*.

(c) *General conception of the matter of Logical Analysis.*

9. Such indications are unfortunately most scanty. As we probably have not the *Metaphysics* in its full extent, actual or contemplated, the want of a clear separation between the inquiries belonging specially to first philosophy and those appropriate to the analytical

[1] *Metaph.*, iv. 1005b 2. See Zeller, *Ph. d. Gr.*, ii. 2 (3rd ed.), p. 184, *n.*; Rassow, *De Definit. Not.*, 46, 47; Schwegler, *Comment. zur Metaph.*, iii. 161; and, *contra*, Prantl, *Gesch. der Logik.*, i. 137. Zeller maintains the view that Aristotle intends to indicate the place occupied by the analytics in his general scheme of philosophy.

[2] On Aristotle's use of the term λογικός and its allies, see (in addition to Waitz, *Com. in Organ.*, ii. pp. 353-55) Schwegler, *Commentar zu Ar. Metaph.*, vol. iv. pp. 48-51.

researches may be due in part to the deficiency of our materials. There are, however, two lines of separation discernible, from which some useful inferences may be drawn. What we call the logic of Aristotle, *i.e.*, the treatises making up the *Organon*, is roughly divisible into three parts: (1) The formal analysis of syllogism and its allied types of reasoning, with the more particular discussion of the elementary parts of reasoning = the proposition; (2) the theory of scientific proof and definition (apodictic); (3) the theory of probable arguments, or of reasoning based on currently received opinions and leading to conclusions more or less probable (dialectic). Certainly for Aristotle there was no such distinction between the first and the remaining two parts as would in any way correspond to the modern separation of general or formal logic from the theory of knowledge, or material logic; the three parts in conjunction make up one body of doctrine. Now dialectic is very specially indicated as being of a formal character, *i.e.*, as dealing with no special matter, but with κοινά, opinions, or types of opinions common to all sciences.[1] Apodictic, we may assume, is in like manner the formal study of what constitutes knowledge strictly so called, the nature of the principles on which knowledge rests, the special marks distinguishing it, and the method by which knowledge is framed.

But in every body of doctrine we may distinguish, according to Aristotle, three things:—the genus or class of objects with which the demonstration is concerned; the essential or fundamental attributes, qualities of these objects, which are to be demonstrated of them; and, thirdly, certain common axioms or principles of demon-

[1] See *Anal. Post.*, i. 11; *Rhet.*, i. 1, and in many passages. *Cf.* Heyder, *Method. d. Arist.*, p. 348.

stration, not themselves demonstrable, and not entering as integral parts into the demonstration, but lying in the background as security for the reasoning carried out by thought employing them. Can anything corresponding to these three facts be discovered, if we assume for the moment, what certainly is not explicitly stated by Aristotle, that analytic constitutes a special body of doctrine? The genus or class about which the doctrine is concerned can only be reasoning itself, either as apodictic or as dialectic, and the latter for a special reason may be left out of account; ἀπόδειξις, then, is the matter concerning which the doctrine is put forward. But ἀπόδειξις is a form of knowledge, that is to say, is subjective. The properties, therefore, of apodictic science can only be made clear if we consider on the one hand the objective counterparts of necessity and universality in thought, and on the other hand the nature of universality and necessity of thought itself. The common principles or axioms, finally, can only be such presuppositions as are made in apodictic or reasoning generally respecting thought in its relation to fact, as grasping or apprehending reality. The consideration of such axioms, it has been already seen, pertains to first philosophy. Analytics then would appear as an independent doctrine, holding of first philosophy on the one hand, both in regard of the common axioms and in regard of the attributes of being, by which it is a possible object of science, and on the other hand referring to the subjective treatment of thought, whether in relation to principles or to fact generally.

A very similar result may be attained if we follow out a line of distinction indicated in more than one portion of the *Metaphysics*.[1] Separating the modes in which

[1] *Metaph.*, vi. 4, v. 29, ix. 10. *Cf.* Schwegler, *Com.*, iii. 241, iv. 29 *sq.*, 186; and Brentano, *Bedeutung des Seienden nach Arist.*, 21 *sq.*

being is spoken of into four—(1) *τὸ ὂν κατὰ συμβεβηκός*; (2) *τὸ ὂν ὡς ἀληθὲς καὶ τὸ μὴ ὂν ὡς τὸ ψεῦδος*; (3) *τὸ ὂν κατὰ τὰ σχήματα τῆς κατηγορίας*; (4) *τὸ ὂν δυνάμει καὶ ἐνεργείᾳ*—Aristotle excludes the second from the special researches peculiar to first philosophy, the study of being as being, but neither excludes it from general consideration in metaphysics as a whole, nor handles it at length, deferring it rather for more detailed treatment. A comparatively clear account, however, of what is understood by him under the head of being as truth and non-being as falsity may be extracted from the various passages referred to, and little doubt can remain that being so regarded is in a peculiar sense the matter of analytical (*i.e.*, logical) researches.

Being as truth and non-being as falsity refer to and rest upon combination and division of the elementary parts of thought. For truth and falsity have no significance when applied to things, but only to the connection of thought which is dominated by the one principle of non-contradiction. Nay, thinking has not even immediate and direct reference to being as such, but only to being as the existent, as qualified, or quantified, or modified in some other way (*i.e.*, according to the categories), and it is in its very essence the conjunction or unifying of elements. What cannot be conjoined, as, *e.g.*, the notions of elementary facts themselves, are not either true or false, and are not matters of thought. Thought thus moves in a definite sphere, that of the combinable or separable, the correspondence of conceptions with real relations, and has its limits on the one hand in the elementary data apprehended by intellect (*νοῦς* = reason), and on the other hand in the infinite sea of particular, accidental qualifications of things (*συμβεβηκότα*). The possibility of contradictory assertions (for true and false judgments together

make up the contradiction, τὸ δὲ σύνολον περὶ μερισμὸν ἀντιφάσεως) is the distinguishing mark of thought.

Now it is this very possibility that lies at the root of all the analytical researches. Not, indeed, that one can assume for Aristotle a view which has appeared in later logical works, that all forms of logical reasoning are to be deduced from the principle of contradiction. Quite the reverse. The common axioms underlie all processes of proof, direct or indirect, but they do not enter into or form part of proof. Nothing can be deduced from them; but their authority can be appealed to against any one who refuses to allow a conclusion reached by a correct syllogism from true premisses.[1] (The nerve of logical proof would thus lie in the disjunctive proposition; either this conclusion is to be granted, or the principle of contradiction is denied.) Now the analytical researches are in especial the treatment of combination and separation in thought. For even the syllogism may be regarded as only a complex judgment or synthesis, and in the exposition of the forms of combination and separation we shall find a complete system extending from the unproved principles and exhibiting the methods according to which thought proceeds towards the determination of the essential properties of things or the discrimination of various heads under which the transitory and accidental attributes may be advantageously classed.

So far then as one can judge, the matter of Aristotle's analytical researches may be expressed as the concrete nature of thought, characterised by its fundamental attribute, the possibility of contradiction, correlated with the real system of things, and having as its end the realisation of systematic knowledge, *i.e.*, the adequate subjective in-

[1] *Cf.* generally *Anal. Post.*, i. 14.

terpetation of being. No further explanation can be obtained without entering in some detail on the actual processes included under the title which has here been somewhat arbitrarily assigned, namely, the concrete nature of thought. At the close of this survey one may be in a position to resume with fuller knowledge the definition here given. For its significance depends entirely on the meaning which in Aristotle belongs to the terms thought and being.

10. This preliminary survey, though sufficient to enable us to fix approximately the position of the analytic researches in the total scheme of sciences, has not thrown an entirely clear light on the principle of the Aristotelian logic. For, as has just been said, the indication that the analytics have to do with being as conceived by thought, conducted under the general axiom of non-contradiction and expressed in language, requires to be filled up by a more detailed treatment of the Aristotelian theory of thought in relation to being. Upon the characteristics assigned to thought or knowledge in this special relation, must depend the general nature of the Aristotelian logic, the determination of the scope of logical treatment, and the essence of logical method. For, from a quite similar statement regarding the province within which logic moves, totally diverse conclusions might be drawn respecting the precise function of logical method. One might have either a formal doctrine or *technic*, or a real methodology: either an attempt to evolve logical principles from the axiom of contradiction, or a development of the laws according to which thought, necessarily acting under the said axiom, proceeds towards the construction of knowledge. The history of logic clearly shows how differently the matter of the analytics may be viewed.

For one of the possible conclusions, that logic is a technical or quasi-mathematical exposition of formal relations, has been accepted as the undoubted result of Aristotle's teaching, and has so prevailed as to make itself the current conception.[1] The other, the view of logic as theory of the method of scientific thought, has been cast entirely into the background, so far as logical doctrines are concerned, and, if allowed at all, has been regarded as foundation for a species of applied logic, an appendix to the other.

11. Not much aid is afforded directly by any classification or division of the books now collected together as the *Organon*. As above noted, the *Prior* and *Posterior Analytics* with the *Topics* form one connected whole, while the *Categories* and the *De Interpretatione* stand apart as isolated treatments of special problems, not organically or necessarily part of the research. The genuineness of both these treatises has been doubted, and there is, indeed, much to make one pause in admitting them to a place in the *corpus* of the Aristotelian works. The tract entitled *Categories* neither refers to, nor is referred to in, any other of Aristotle's undoubted writings; and, though the extreme opposition supposed to exist between its teaching in regard to first and second essences and the teaching of the *Metaphysics* rests on no solid foundation, the mode of expression and the general treatment have in them something strange and foreign. It is most remarkable, if the tract be Aristotle's, that no cross reference should be found between the treatment there given of fundamental notions like quantity, quality, and relation, not to speak of substance (*οὐσία*), and the book of definitions

[1] *Cf.* Brandis, *Gr.-röm. Phil.*, ii. 373-75.

contained in the *Metaphysics* (Book Δ). The concluding chapters are generally regarded as spurious, and we shall probably not be wrong in viewing the whole as a redaction of Aristotelian material rather than as a formal treatment by Aristotle himself.[1] The *De Interpretatione* has somewhat stronger external evidence in its favour, for, though it is not referred to in any work of Aristotle's, it seems to refer unambiguously to the *Analytics* and *Topics*, and vaguely to the *De Anima*.[2] Nevertheless there is this to be said, that references are not in such a case conclusive, that the structure of the book is unwieldy and clumsy, not such a treatment of the proposition as one would expect from Aristotle *after* the *Analytics*, and that in one or two points, in the classification of judgments according to quantity, and in the way of regarding modals, the teaching is not in perfect harmony with that of the *Analytics*.[3] One would not probably be far wrong in concluding here, as in the case of the *Categories*, that the work is a redaction, perhaps drawing from other lost writings of Aristotle, perhaps based on oral teaching, by some Aristotelian scholar.

In the *Analytics* the aim is defined to be the examination

[1] Internal evidence, if worth anything, is strongly against Zeller's view that the book is not only genuine, but an early work (*Ph. d. Gr.*, ii. 2, 69).

[2] See Bonitz, *Index Arist.*, *s.v.* "Aristoteles"; Zeller, *Ph. d. Gr.*, ii. 2, p. 71. The vagueness of the reference to the *De Anima*, which, indeed, cannot be verified, led Andronicus to reject the *De Interpretatione*.

[3] The differing ways in which universality in a proposition are explained in the *De Inter.* and the *Analytics* is deserving of attention, as also the absence from the *Analytics* of the peculiar designation ἀόριστον as applied to negative terms—nouns or verbs. All that is essential in the treatment of these negatives is given, however, in *Anal. Pr.*, i. 46.

of apodictic or scientific proof; but the examination of the elements of syllogism is first undertaken, since in all demonstrative science syllogism is employed, while, on the other hand, syllogism may present itself in dialectic matters. The first book of the *Prior Analytics*,[1] after a brief statement of the nature of the proposition and of the fundamental law of predication, proceeds to analyse (1) the various kinds, figures, or modes of syllogism; (2) the means by which syllogisms are formed; (3) the reduction of various imperfect forms of argument to the perfect syllogistic type. The unity of the book is unmistakable, and the plan is indicated in more than one place by Aristotle himself. The second book, on the contrary, has little or no unity, and is loosely connected with the first.[2] It consists of a series of detached tracts, dealing with the theory afterwards called that of *Consequence*, with circular reasoning, with the possibility and consequences of syllogism formed by converting parts of the original argument, with certain modes of indirect argument and fallacy, and concluding with brief handling of induction, paradigm, enthymeme, argument from signs, probabilities, &c.

The *Posterior Analytics*, much less perfect in form than the first book of the *Prior Analytics*, contains the Aristotelian theory of ἀπόδειξις or demonstrative science, and in its first book deals with the general nature of demonstration, the grounds on which it rests, its form, and its essential significance. The second book contains the theory of definition in its relation to demonstration, and falls into three portions — the first, raising difficulties or questions regarding the nature and possibility of

[1] Which is sometimes referred to explicitly as περὶ συλλογισμοῦ.

[2] The references to what has been accomplished, indeed, seem to point to some other treatment than that in the first book.

definition; the second, grounding definition, as the final result of knowledge, on the process of demonstration; and the third, in a single chapter, investigating the method by which the first principles of ἀπόδειξις are known. The book requires much supplement from the similar treatment in the *Metaphysics*, *Ethics*, and *Topics*.

The *Topics*, starting with a general explanation of syllogism and allied forms of reasoning, proceeds to investigate in what way the materials for dialectic argument are to be obtained and used. The elaborate treatment of what is now comparatively uninteresting has caused the significance of some portions of the work, as bearing on the theory of inductive research and demonstration generally, to be overlooked. Valuable hints are to be drawn from the work regarding other more important Aristotelian doctrines.[1]

12. The logical researches as a whole, then, manifest a strong unity, and at the same time refer to one fundamental opposition, that between *apodictic* and *dialectic* reasoning, the nature of which must be first investigated. It will be found that the investigation leads at once to the further problems, What precisely is Aristotle's conception of knowledge, in its origin, essential nature, and method of formation? and second, what is the foundation of the syllogism as the form of reasoning, whether apodictic or dialectic?[2]

[1] Generally one may say that a selection of these significant passages would be of greater service to the student than even so patient and detailed an abstract of the whole as is given by Grote (*Aristotle*, i. and ii.)

[2] The most important treatment of the principles and details of the Aristotelian logic, which are here drawn upon freely, are (1), *instar omnium*, that of Prantl (*Gesch. d. Logik*, i. pp. 87-346); (2) that of Brandis, *Aristoteles*, pp. 148-434, and *Aristotelisches Lehrge-*

The opposition between apodictic and dialectic is in the Aristotelian system the development of that which had already played so important a part in Plato and Socrates, the distinction between science and opinion. Knowledge in the strict sense had there presented itself as the generalised notion referring to being in its very essence, and resting on thought or reason. Opinion is the quasi-knowledge of the particular, referring to that which is not being but only accident, and resting on sense or imagination. In the Platonic method this distinction had come forward as the underlying basis for the opposition of philosophy and sophistical rhetoric; in Aristotle a much more precise formulation is given of the characteristics of the two opposed forms of thought, and the connection between opinion or dialectic and rhetorico-sophistical discussion is made more concrete and profound. Dialectic, with Aristotle, is the system resulting from the attempt to reduce to rule or generalise modes of argument which rest upon current received doctrines as principles, which move within the region of interests about which current opinions *pro* and *con* are to be found, and which terminate not in the decisive solution of a problem but in clearing the way for a more profound research, or at least in the establishment of the thesis as against an opponent.

bäude, pp. 12-62 (in which there is sharp criticism of Prantl's view); (3) that of Grote, *Aristotle*, vols. i. and ii. pp. 1-134 (most patient and accurate, but tending continuously to minimise the speculative element); (4) that of St Hilaire, in his essay *De la Logique d'Aristote*, 2 vols., 1838, and in his translation of the *Organon;* (5) that of Biese, *Phil. d. Arist.*, i. 44-319, Trendelenburg's *Elementa Logices Aristotelicæ*, Waitz's edition of the *Organon*, and Ueberweg's *System der Logik* contain much of value. Mr Poste's translation of the *Post. Anal.* and *Sophis. Elenchi*, Mr E. Wallace's *Outlines of the Phil. of Aristotle*, and Mr Magrath's *Selections from the Organon* will also be found of service.

Dialectic, then, has no special province; it deals with κοινά or ἔνδοξα, and its methods are perfectly general. On the one hand, as being the application of reasoning, it refers to and employs the specific types of reasoning, syllogism, and induction; on the other hand, as being applied to matters of opinion, and borrowing its principles from current floating dicta about matters of common interest, the types of reasoning tend in it to assume special forms resembling those employed in rhetoric (which is a kind of offshoot from dialectic—the application of dialectic to political principles).

The province of dialectic being thus essentially vague, the matters about which dialectic reasoning is concerned being of the most fluctuating character, there must be, for Aristotle, the greatest difficulty in determining, *per se* and apart from the opposition to apodictic, what is the character of dialectic syllogism and induction. Nor can it be said that the interpreter of Aristotle has an easy task in the endeavour to discover what precisely is dialectical reasoning and in what way the forms which are assumed to be common both to apodictic and dialectic come to have any application to the fluctuating mass of current opinions. It is comparatively simple to say apodictic and dialectic differ in this, that the one rests on principles essential, necessary, seen to be true, while the other proceeds from data which are merely received as credible and as containing probable received opinions on a subject about which there may be difference of view; and it may be added that in the one we reach conclusions which are essential, in which the predicate is necessarily and universally true of the subject, while in the other the conclusion remains, like the data, credible merely, and is, at best, only one of the probable answers to a

question. But there remains the difficulty, which is certainly not cleared up by any direct statement from Aristotle — of what nature is the syllogistic inference that applies to material of this kind? what is the *nervus probandi* in a dialectic syllogism?

There are two possible views—either that the principle of syllogistic inference is purely formal, deducible from the characteristic of thought as either affirming or denying in reference to a particular subject, and therefore capable of application either to probable or to necessary matter; or that the syllogism is explicable only as a form in which knowledge is established, and is applicable but *per accidens*, as one may express it, to probable matters. Under this second view, the possibility and reality of syllogistic inference would be traced to the correlative peculiarities of human thought and of the nature of the objects of thought, and it would follow that in strictness there is no dialectic syllogism. Such a conclusion at first sight appears to stand in sharp opposition to quite emphatic utterances of Aristotle; but if we suppose, for the sake of example, that a dialectic syllogism were framed, we should readily discern that the link of connection between data and conclusion, the *nervus probandi*, as it may be called, does not in fact differ from that involved in the apodictic syllogism. The merely probable character of the data prevents the conclusion from having a higher value than mere likelihood, but does not affect the chain of inference, which proceeds on assumptions identical with those involved in apodictic. Aristotle is chary of any examples of dialectic syllogism; and indeed, if one considers that all forms of modality are investigated in the general analysis of syllogism, it becomes difficult to see what specially distinguishes dialectic inference. It is not to be denied, however, that the

investigation of the grounds for the coexistence of dialectic and apodictic is incomplete in Aristotle, as it confessedly is in Plato.

Unless, then, it can be shown beyond possibility of question that Aristotle does lay down purely formal rules for syllogism, rules deducible simply from the fundamental axiom of thought—and the evidence on which such a view is based will be examined later—we do not obtain much light from the opposition between dialectic and apodictic. More important results, however, are gained when we consider the Aristotelian doctrine of genuine knowledge, of ἀπόδειξις, for, among the numerous elements that here fall to be noted, some are of quite general import, and apply to the whole process of the formation of knowledge.

13. Apodictic knowledge generally is definable through the special marks of its content. It deals with the universal and necessary, that which is now and always, that which cannot be other than it is, that which is what it is simply through its own nature. It is the expression of the true universal in thought and things, τὸ καθόλου. Further, as a method, ἀπόδειξις is characterised by the nature of its starting-point, and of the connecting link involved, as well as by the peculiarity of its result. It rests upon the first, simplest, best known, unprovable elements of thought, the πρῶτα καὶ ἄμεσα, which are not themselves in the strict sense matters of apodictic science, which are ἀναπόδεικτα. In all the intermediate processes of scientific proof there is involved generally this dependence upon previously established principles, and, when apodictic is taken in its ultimate abstraction, these previously established principles are seen to be the prior, ultimate elements, assumptions in thought about things, as one may provisionally describe

them. The peculiar connection involved is simply what we understand by the principle of syllogism. No syllogism is possible without the universalising element, the *καθόλου*, and knowledge in its essence is syllogistic.[1] The conclusion of the syllogism in which essential attributes are attached to a subject is the concretion or closing together of the two aspects of all thought and being, the universal and particular.[2]

The fuller explanation of apodictic thus refers us to three points of extreme importance in the Aristotelian theory of knowledge: the precise nature of the *καθόλου*, which presents itself as the characteristic feature of *ἀπόδειξις*; the relation of fundamental and universal in things on which the possibility of *ἀπόδειξις* is founded; and the forms of thought through which the universal and particular factors are subjectively realised. The three are most closely connected, and as they involve the main difficulties of the Aristotelian philosophy as a whole, a general treatment of them is indispensable. First then of *τὸ καθόλου*, the characteristic term in the explanation of knowledge. Of this term, as of others in the Aristotelian lexicon, the uses are various, more or less precise. In the less precise significance it is employed merely as equivalent to general or universal. Thus the universal

[1] *Cf. Topica*, pp. 164a 10.

[2] See specially *Anal. Pr.*, 67a 39 *sq.*, and compare the elaborate note of Kampe, *Erkenntnissthcorie des Arist.*, p. 220 (also p. 84). Grote (*Aristotle*, i. p. 263) remarks: "Complete cognition (*τὸ ἐνεργεῖν*, according to the view here set forth) consists of one mental act corresponding to the major premiss, another corresponding to the minor, and a third including both the two in conscious juxtaposition. The third implies both the first and the second." The connection between this and the Aristotelian doctrines of *νοῦς* in its relation to *αἴσθησις* will not escape attention.

judgment of the logical researches is λόγος καταφατικὸς ἢ ἀποφατικὸς καθόλου, *i.e.*, τὸ παντὶ ἢ μηδενὶ ὑπάρκειν. But there always underlies this vague significance a reference to the deeper doctrine according to which the *universal* is the more important element given in nature. For apodictic, then, which deals explicitly with this more profound sense, there is required a more stringent definition of καθόλου, and such is given with great precision by Aristotle. τὸ καθόλου is essentially double-sided. On the one side it is the universal of empirical knowledge, the generic or class universal —it is τὸ κατὰ παντός; on the other hand, it is the root or ground of the empirical universal—it is τό καθ' αὑτὸ καὶ ἢ αὐτό,[1] that which is in, for, and through itself, the essential. Now the essential, καθ' αὑτό, is in the first place, either that which enters into the being and notion of a thing as a necessary prerequisite (for example, *line* is a necessary element in the being and notion of triangle), or that which is the necessary basis of an attribute (*e.g.*, *line* in reference to *straight* and *curved*), or in the second place, that which is as subject only and not as predicate, or finally that which is *per se* the cause or ground of a fact or event.[2]

Thus the function of thought (of apodictic) is the exposition with reference to a determined class of objects of all that necessarily inheres in them, on account of the elementary factors which determine their existence and nature. Real things, individual objects, are the basis of

[1] *Anal. Post.*, 73b 26, καθόλου δὲ λέγω ὃ ἂν κατὰ παντός τε ὑπάρχῃ καὶ καθ' αὑτὸ καὶ ᾗ αὐτό. See *Index Aristotelicus*, *s.v.*, pp. 356-57, and on καθ' αὑτό compare Heyder, *Method. d. Arist.*, 310 *n.*, and Bonitz, *Com. in Met.*, pp. 265-66. On the distinction between καθόλου and γένος, see Bonitz, *Com. in Met.*, pp. 299, 300; Zeller, *Ph. d. Gr.*, ii. 1, p. 205, 206.

[2] *Cf.* Prantl, *Ges. d. Logik*, i. 121, 122, who has rightly placed the function of καθόλου in the foreground.

all knowledge, but in these individuals the elementary parts, causally connected, and leading to ulterior consequences, form the general element about which there may be demonstrative science. Thought which operates upon them does so, as we have already seen, under the peculiar restriction of its very nature, as the subjective realisation of the notion of things; and the principles expressing this restriction, the logical axioms, may be appealed to if demonstration be opposed groundlessly; but these axioms do not enter into the process of demonstration. "When the apodictic process has attained its end, that is, when all the universal propositions relating to a given class, with insight into the necessary character of the predication in each case, have been gathered up, then the καθόλου of knowledge in respect to that class has been realised."[1]

14. Probably the example of apodictic which Aristotle bears chiefly in mind is mathematical science, and in his treatment of the characteristic marks of this doctrine most of the peculiarities of apodictic occur. In mathematical science abstraction is made of the material qualities of the things considered, of those qualities which give to them a place as physical facts; but the abstracta are not to be conceived as entities, self-existing. They are not even to be conceived as existing only in mind, as ideal types; they truly exist in things, but are considered separately (ἐξ ἀφαιρέσεως). The first principles of mathematical science are few and definite, and the procedure is continuously from the simple and absolutely more known to the concrete and relatively more known. As in proof generally, so in mathematical demonstration, an essential quality (συμβεβηκός καθ' αὑτό) may be proved of a subject, and yet

[1] Prantl, i. 126.

such quality may be still accidental, *i.e.*, not predicated of the subject on account of its generic constituent marks, but capable of being deduced from the constituent mark of that which enters into the subject, as, *e.g.*, a given figure's exterior angles are equal to four right angles. Why? Because it is an isosceles triangle. Why has an isosceles this property? Because it is a triangle. Why has a triangle? Because it is a rectilineal figure. If this reason is ultimate, it completes our knowledge, *καὶ καθόλου δὲ τότε*.[1] Thus the range of mathematical proof extends from the *πρῶτα*, the original definitions, which at the same time assume the existence of the things defined, through the determinations *καθ' αὑτά* to the qualities (*συμβεβήκοτα*), which can be shown to attach to their subjects, to be in a sense *καθ' αὑτά*, while a continuous series of middle notions, concerning which there cannot be much ambiguity, effects the transition.

Moreover, in mathematical science, one can see with the utmost evidence the correlation of reason and sense, which will presently appear as a fundamental factor in Aristotle's general theory of knowledge. The *πρῶτα* are not to be conceived as innate or as possessed before experience. They are seen or envisaged, intuited in perception by *νοῦς*, and induction here as elsewhere is the process by which perceptions are gathered together for the reflective and intuiting action of *νοῦς*. In the mathematical individual, more evidently than in any other case, is visible the union of thought and sense. The demonstration which employs a diagram does not turn upon any properties of the diagram which are there for sense only, not for reason, but upon the general elementary relations contemplated in

[1] *Anal. Post.*, i. 24, 86a 2.

thought.[1] In mathematical development, that which is potentially contained in the ὕλη νοητή on which mathematical thinking operates is brought forward into actuality by the constructive processes through which the proof is mediated, and the potential knowledge contained in the intuition of mathematical elements becomes actual through the process of constructive thought.[2]

Finally, the relation of pure mathematical reasoning to that found in sciences generically one with mathematics, *e.g.*, optics, astronomy, harmonics, &c., furnishes an interesting example of the relation between reasoning based on fact and on causal ground.[3]

15. The process of ἀπόδειξις generally and of mathematical demonstration in particular has brought into clear light the prominent characteristic of knowledge according to the Aristotelian view. Knowledge must always be regarded from two sides, as having relation to the universal,

[1] *Cf.* the passage from *De Memor.*, p. 450, quoted by Brandis, *Aristoteles*, p. 1133—*συμβαίνει γὰρ τὸ αὐτὸ πάθος ἐν τῷ νοεῖν ὅπερ καὶ ἐν τῷ διαγράφειν· ἐκεῖ τε γὰρ οὐθὲν προσχρώμενοι τῷ τὸ ποσὸν ὡρισμένον εἶναι τὸ τριγώνου, ὅμως γράφομεν ὡρισμένον κατὰ τὸ ποσόν· καὶ ὁ νοῶν ὡσαύτως, κἂν μὴ ποσὸν νοῇ, τίθεται πρὸ ὀμμάτων ποσόν, νοεῖ δ' οὐχ ᾗ ποσόν. ἂν δ' ἡ φύσις ᾗ τῶν ποσῶν, ἀόριστον δέ, τίθεται μὲν ποσὸν ὡρισμένον, νοεῖ δ' ᾗ ποσόν μόνον. Cf.* also *Met.*, vii. 10 and 11. Aristotle's view strongly resembles, in this point at least, that of Kant.

[2] See *Metaph.*, ix. c. 9, p. 1051a. Some interesting remarks on the process of mathematical construction and its relation to syllogistic proof will be found in Ueberweg's *System der Logik*, § 101, p. 273.

[3] See generally *Anal. Post.*, chap. 13. Of Aristotle's views on mathematics the best expositions seem to be those of Biese (*Ph. d. Arist.*, ii. 216-34), Brandis (*Aristoteles*, pp. 135-39, and *Aristot. Lehrgebäude*, 7-11), and Eucken (*Methode d. Arist. Forschung*, pp. 56, 66).

and as bearing upon the particular.[1] It is in itself the union of the general and the particular, of the universal and the individual. This fundamental notion of knowledge is not only the integral element in the Aristotelian theory of science, but also the guiding principle in his scientific method.[2] In all cases we require to keep in mind the necessary correlation of the particular facts and the general grounds, the multiplicity of effects and the unity of cause. The one element is not apart from the other. Universals as such are of no avail either as explanations of knowledge or as grounds of existence. Particulars as such are infinite, indefinite, and incognisable. Only in the union of these—a union which objectively regarded is the combination of form and matter, of potentiality and actuality, of genus and ultimate difference, subjectively is the combination of the data of sense, imagination, and intuitive faculty of reason—is knowledge possible. And the methods by which knowledge is formed in us regarding things exhibit the same twofold aspect. Syllogism as the form of the process from generalia to the determination of attributes of the individual subject, induction as the method of procedure from the vaguely apprehended individuals to the generalia or principles, alike, when analysed, exhibit the conjunction of the universal and particular.

But while this general view is undoubtedly to be ascribed to Aristotle, it is no less undoubted that grave difficulties are felt when his various utterances on the fundamental points of the doctrine are placed side by side and the attempt made to extract from them a harmonious and con-

[1] *Cf.* specially *Anal. Pr.*, ii. 21.

[2] This is excellently put by Eucken, *op. cit.*, pp. 44-55.

sistent doctrine.[1] That some of these difficulties are due to the fragmentary condition in which the successive treatments of the question have come down to us may be allowed; but, as the question involved is in truth the cardinal difficulty of all metaphysical thought, it may well be said that a quite harmonious view is not to be expected; and in particular this may be said when one considers the doctrine of perception in which the metaphysical determinations of universal and particular come forward in subjective fashion.

16. Opposing throughout the Platonic doctrines of Ideas, separable from the objects known, and declaring that the assumption of such isolated forms not only involved contradictions but was of no service in solving the problems of generation and of knowledge, Aristotle is led to emphasise the individual as the ultimate fact in existence and cognition. Universals as classes have no separate substantive existence: they do not indicate the individual τόδε τι, but a property or quality common to many individuals, ποῖον τι; their function is predicative. No doubt they are οὐσίαι in a sense, for they indirectly refer to individuals—*i.e.*, one cannot overlook the closeness of connection between the individual things having essential attributes in common and the notion of these attributes.[2] The individual thing

[1] See specially the treatment by Heyder, *Methodol. d. Arist.*, pp. 140-216, which is most instructive and comprehensive. The commentaries of Bonitz and Schwegler on the relative portions of the *Metaph.* (iii. cc. 4 and 6, vii. and xiii. 10) should be consulted. Zeller (*Phil. d. Gr.*, ii. 2, pp. 300-313) brings out the fundamental difficulty, and notes some attempted solutions of it. Kampe (*Erkenntnisstheorie d. Arist.*, 160-170) lays special stress on the subjective or psychological aspect.

[2] It is probably the most helpful view, and one enabling us alto-

is the basis of all attributes, it is the underlying reality which presents itself in the natural process of becoming as the subject determined in existence, quality, quantity, relation, &c.[1] But what is the individual thing? It can hardly be said that to this Aristotle returns any single unambiguous reply; his utterances, in fact, disclose a real difficulty, and point to the presence of a twofold conception of the individual: the individual as the ultimate, unqualified, undetermined unit, the last result of abstraction; and the individual as the concrete thing, qualified and determined to the full extent by its generic and specific marks. With these diverse conceptions floating before him, now one, now the other becoming prominent according to the special problem in hand, Aristotle's expressions sometimes present apparently irreconcilable divergencies. The difficulty specially pressing upon him was one arising from the definition of knowledge. Knowledge is of the general and necessary; how then can there be knowledge of the individual? Knowledge is not a process capable of infinite regress; its principles are definite and its method determinate. But particulars are infinite; how then can there be knowledge of them?[2] Aspects of the same difficulty present themselves at every stage in which reference is made to the nature of ultimate parts or elements, as, *e.g.*, the parts of definition and of the definiendum. So far as solution is offered it is the following:—

The *subject* or *substratum* of predicates is certainly one mode of describing the ultimate fact in existence and

gether to reject the fancied opposition between the *Categoriæ* and the *Metaph.*, to regard δεύτεραι οὐσίαι as specially the concrete general notions, in respect of which there is always confusion possible between the thought-content and the real class referred to.

[1] See below, p. 176 *sq.*

[2] *Met.*, 999a 26, 1003a 5, and *cf.* xiii. c. 10.

knowledge. But this subject, as a concretum or *σύνολον*, contains in itself matter and form. Form when first analysed appears to consist of those very predicates which we have already seen to be secondary in nature, and when abstraction is made of them, there appears to remain nothing save undetermined matter. Now matter is precisely that which in itself is incognisable. The truth is our first analysis is imperfect. The connection of *ὕλη* and *εἶδος* in the *σύνολον* is not mechanical aggregation, nor is *εἶδος* to be identified with generic properties regarded as generic. The form is the intelligible universal element in the concretum; it is that which gives definiteness, actuality to the indefiniteness and potentiality of matter. It is the formal cause, the notional essence of the thing, and its perfect expression in thought is the definition, for in the definition the generic properties of the thing and its ultimate specific difference (*διαφορά τελευταία*) are the necessary elements. It is *notional essence*, *i.e.*, it is the unity of the essential properties as grasped by thought and apprehended as really existing.

The individual would thus appear in the Aristotelian metaphysic as the union of the universal and definite with the particular and indefinite, and in a sense as the final goal of the determining process of knowledge; for the *τι ἦν εἶναι*, which is the notion of *τόδε τι*, is expressed in definition, the last result of scientific knowledge.[1] Such

[1] Such a result, it appears to be said in the chapter of the *Metaphysics* previously referred to (xiii. c. 10), when supplemented by a special distinction, may yield a solution of the difficulty regarding knowledge as essentially general and things known as essentially individual. "Knowledge, like the act of cognising, is either in potentiality or in actuality. In potentiality, *i.e.*, in the aspect in which it resembles matter, itself universal and indeterminate, knowledge is universal and indeterminate; in actuality, as being definite and individualising, it is definite and of the individual." The passage

a conception, however, is not carried out consistently, and, in particular, fails to reconcile itself with the doctrine of the individual that comes forward, partly in the metaphysics, but mainly in what one might call the Aristotelian theory of knowledge.

17. It is not possible to hold questions of metaphysic strictly apart from those of theory of knowledge, and in Aristotle's treatment of the universal and particular we find that the main features of interest attach to the conditions under which an individual or general is cognisable. Now, throughout the analytical researches, the rhetoric, ethics, and generally the subordinate branches of philosophy, one notes an apparently well-defined significance attached to the individual. Τά καθ' ἕκαστα, the particulars of experience, present themselves as the first given data of knowledge, the basis upon which progress to principles or generalia is founded. Τὰ καθ' ἕκαστα are prior or simpler so far as our cognition is concerned; and arguments based on apprehension of them, arguments of fact or effect, are more persuasive and more easily grasped than arguments from principles or causes. Apparently, also, if we confined attention to some of the more direct *dicta* on this perplexing doctrine, we might assume that, according to Aristotle, knowledge was to be conceived as first ascend-

has never appeared very satisfactory to commentators. Doubtless we might interpret it freely in connection with the distinctions given below respecting knowledge and perception; but it is specially interesting to notice how this description of cognition as twofold, as of the indefinite, and so universal in one aspect and not in another, as of the individual, and so not universal in one aspect while most truly universal in another, applies to mathematical cognition as above sketched by Aristotle. — *Cf.* Brandis, *Aristotelisches Lehrgebäude* (*Ges. d. gr.-röm. Phil.*, iii.: 1), p. 9.

ing inductively from particulars to the universal, and then descending deductively from these. This, however, is an altogether inadequate view; and hints are supplied which, though not enabling a quite coherent doctrine to be formed, yet enable us to understand somewhat more clearly not only the special difficulty experienced by Aristotle, but also his method of solving it. Of those hints but two groups can be here taken into consideration.

(1) The particulars, *τὰ καθ' ἕκαστα*, are objects of perception, *αἰσθητά*. It has already been seen that *τόδε τι* involves form and matter, and is the concretum of both. Perception then might be supposed to be a complex process, involving in some way apprehension of form and receptivity of matter, and containing subjectively both. Aristotle's analysis of perception is far from complete, but we are able to say with respect to it that in his view *αἴσθησις* is not to be regarded as a simple process, directly receptive of the individual as such. Such a view of perception is altogether foreign to the Aristotelian psychology in which the subjective processes of mind, with the objective system of things, are conceived as mutually involving and involved, in which the lower faculties, as we may call them, potentially contain the higher, in which the subjective process of knowledge is the evolution of that which is contained in an undetermined, indefinite form in the lower stages of apprehension. Thus Aristotle not only marks that sense-perception as a whole is apprehensive of the *καθόλου*, while separate acts of perception are apprehensions of the individual, but he distinguishes in perception aspects or stages which, in more modern phraseology, might be described as (*a*) receptivity of impression, (*b*) intuition of sense forms, (*c*) classification with representations of past experience. In each sense-perception there is apprehension of the proper sensible,

and also apprehension of the common forms of sense intuition, and finally, there is apprehension of the *αἰσθητὸν κατὰ συμβεβηκός*, which is virtually recognition of the individual as representative of something else. Perception, then, one may say, is used both in a vague sense as marking, with respect to the genesis of knowledge, the apprehension of facts, and in a more exact sense, as a compound involving not only receptivity but also the cognising power *par excellence*, *i.e.*, *νοῦς*. Only by the presence of *νοῦς* is light given to the processes of perception.

(2) Quite in accordance with this is the Aristotelian view of the apprehension of principles or generalia. *Καθόλου* is nothing *per se;* it is only as related to particulars. In no way, then, save in and by apprehension of particulars, can the universal be reached. Were it not for the natural power of retention, the collecting of similars in experience, and the formation of a permanent representation, the intuiting power of *νοῦς* would have no object. But the two sides are not to be conceived as isolated. They are only in correlation, and one can thus understand how Aristotle should both assert that principles are reached by induction, and that *νοῦς* alone is the source of principles. The ultimate principles are seized or apprehended by *νοῦς*, and in respect of them the form of knowledge does not take the form of a judgment, which may be true or false. The principles are either apprehended or not apprehended. All intermediate truths, capable of proof by reference to even higher principles, form the matter of apodictic, that is to say, of *νοῦς* in its twofold aspect as at once apprehensive of universals and of particulars. Deductive proof and induction are two strictly correlated processes.

Although this general view undoubtedly represents a true Aristotelian position, yet there remain a sufficient

number of expressions of opposed tenor which point to the existence of a real difficulty and of an ambiguity in Aristotle's conception of the individual as known to us. For in the theory of the formation of knowledge, induction is continuously defined as starting from the individual definite thing known, the part, and it is explicitly stated that knowledge of the individual does not imply knowledge of the general, that the one is an affair of sense-perception, the other of intellect.[1] Αἴσθησις is with equal explicitness said to be of the universal and not of the universal.[2] It is pointedly declared that induction rests on *αἴσθησις*, while at times the two processes seem to be opposed. Finally, the process by which a universal is gathered from induction leaves it doubtful to what extent the generalising force of *νοῦς* is to be assumed as present at all stages of the process. For we are said not to have the universal immediately in the particulars given, but to hunt it out (*τὸ καθόλου θηρεύειν*); and in those cases in which the connection, necessarily expressible in a general law, between two facts is actually perceived, it is declared that we do not see (perceive) the universal, but have the universal from the perception (*ἔχοντες τὸ καθόλου ἐκ τοῦ ὁρᾶν*).

These discrepancies of statement arise in part from the extreme difficulty of adequately expressing the constant correlation of universal and particular, that is, of expressing in all cases so that the conjunction shall be kept in mind, and in part form a real philosophical ambiguity in Aris-

[1] *ὁ δὲ ταύτην ἔχων τὴν πρότασιν* (viz., that an isosceles triangle has its angles equal to two right angles) *τὸ καθόλου* (viz., that all triangles have this attribute) *οὐδαμῶς οἶδεν, οὔτε δυνάμει οὔτ' ἐνεργείᾳ· καὶ ἡ μὲν καθόλου νοητή, ἡ δὲ κατὰ μέρος εἰς αἴσθησιν τελευτᾷ.—Anal. Post.*, 86a 28-30.

[2] *οὐ γὰρ ἦν τοῦ καθόλου αἴσθησις.—Anal. Post.*, 88a 2. *ἡ δ' αἴσθησις τοῦ καθόλου ἐστίν.—Anal. Post.*, 100b 17.

totle's doctrine, an ambiguity which is not found only in his system. *The* universal which is implicated in the particulars is not one only, but several. For example, in the case used by Aristotle of the isosceles triangle, the universal, triangle, is not in this respect implicated that the proof is seen to involve reference to the wider class; but, none the less, since the actual knowledge is not of the given sense fact, an isosceles triangle drawn before one, but of that which is signified by the figure, there is *a* universal present—viz., isosceles triangle. So if we take, for example, effects presented in experience and apprehended, as Aristotle would say, by αἴσθησις, it is not indispensable for our apprehension of them that the notion of the specific cause giving rise to them should be implicated in turn. The universal, in this concrete sense, is present neither potentially nor actually. Nevertheless, each fact, as a phenomenon of apprehension, is only as a combination of general elements with particular. The progress of knowledge might with equal accuracy be described as a progress from the vague, indefinite universal to the precise determinate particular, or from the determinate particular to the more extensive universal. Accurate statement of this twofold nature of the elements of knowledge, and consequent formulation of the theory of knowledge so as to embrace both, we do not find in Aristotle, but we do find abundant hints from which the true view may be elicited.

18. If there is, then, ambiguity in regard to Aristotle's conception of the individual, one would expect to find similar difficulties in respect to the universal. Yet here, in virtue of the strong opposition to the Platonic theory of generic or class universals, a much more accurate and precise

determination of the fundamental notion is furnished by Aristotle. To him the universal as such is not the class, or common attributes as they may be gathered by observation, induction, and division, but the notion of the ground or reason, of these elements whereby each thing has its position defined in what may be called the intelligible system of things. That Aristotle succeeds in making quite clear this new and fruitful idea, that he distinguishes with sufficient care and precision between the subjective elements of the conception (the forms in which the notion is realised in our thought) and the objective or real causes by which the system of things is held together, we cannot affirm; but the formal subjective side of his doctrine is expounded with extraordinary sagacity, and lies at the very root of his theory of apodictic.

19. The characteristics of scientific knowledge have thus become evident. In each branch of knowledge there are involved, as before said, the specific genus or class, the attributes concerning which there is to be demonstration, and the common axioms or principles. Each branch, moreover, implies special principles, *ἴδιαι ἀρχαί;* there is no all-comprehensive science from which truths are to be deduced, and from the common maxims alone nothing can be inferred. *Ἀπόδειξις* involves principles, and starts therefore of necessity with what may be called definitions. Yet definitions are at the same time the final result of apodictic demonstration, and the original assumptions may be pushed farther and farther back till they appear as the *πρῶται καὶ ἄμεσοι προτάσεις* which are only apprehended by *νοῦς*. From this distinction between knowledge as completed and knowledge as in process of formation, as from the distinction between sciences of the same genus as more

or less general (*e.g.*, geometry and optics), there follow the distinctions between propositions necessary and propositions true ἐπὶ τὸ πολύ, between proof of fact and proof of essence, between deduction and induction, between syllogism as generic form of all proof, and the special type of syllogism in which completed knowledge is expressed.

We are thus enabled to reconcile what seem at first sight discrepancies in the Aristotelian doctrine,—as, *e.g.*, the insistence upon induction as furnishing the principles of reasoning (τὰ καθόλου) coupled with the attempt to show that induction too is a kind of syllogism; the explanation of proof as involving essence, coupled with the admission of syllogisms of fact; the treatment of propositions as necessary and contingent in themselves, coupled with the distinction between ἐπιστήμη and δόξα. In all forms of knowledge there is the twofold aspect, that which turns upon the essential connections, and that which refers to the isolated facts wherein such connections make their appearance. Syllogistic as formal analysis of what is common in all knowledge is one part of the all-comprehensive theory of knowledge, an integral but not a self-existing part.[1]

[1] The passages in which an apparently formal view of logical relations is expressed are mainly the following: *Topica*, i. chap. vi. (in which the fundamental logical forms of definition, genus, property, and accident are explained by reference to the coincidence of the spheres of subject and predicate in a proposition); *Anal. Post.*, i. chap. 26 (συλλογισμός ἐστιν, ὃς ἂν οὕτως ἔχῃ, ὥστε ἢ ὅλον πρὸς μέρος ἢ μέρος πρὸς ὅλον ἔχειν); *Anal. Post.*, ii. 3 (ἑτέρου δὲ ἑτέρα ἀπόδειξις, ἐὰν μὴ ὡς μέρος ᾖ τι τῆς ὅλης. τοῦτο δὲ λέγω, ὅτι δέδεικται τὸ ἰσοσκελὲς δύο ὀρθαῖς, εἰ πᾶν τρίγωνον δέδεικται· μέρος γάρ· τὸ δ' ὅλον); *Rhetorica*, i. 2, § 19. The general treatment of syllogism in *Anal. Pr.*, i. 4, as apparently resting on the principle of subsumption or logical substitution, has no precise bearing. But the use of the term ὅλον by Aristotle is not to be regarded as identical with its use by

20. The general idea of the Aristotelian analytic thus obtained does not require to be supplemented by any detailed survey of the logical system into which it is evolved; but a brief summary of the most important points and indication of the relation in which the parts stand to the whole may be of advantage.

The simplest form of knowledge, that in which being as true or false is apprehended, is the judgment. The consideration of the judgment is therefore the first part of the analytical researches. Here Aristotle distinguishes more accurately than any of his predecessors (indeed for the first time with accuracy) between subject and predicate as integral parts, symbolised by the noun and verb, and signifying the relations for us of things as appearing under the schemata of the categories. The material basis of the judgment, as one may call it, is the thing as an object of possible knowledge, *i.e.*, the thing as individual (and therefore as involving matter and form, the particular and the general), as qualified, specifically, in time, space, quantity, and relation, and existing as one mode in the universal nexus of potentiality and actuality. These metaphysical forms, and, specially, the deep-lying modes of potentiality

later logicians, and it is not rashly to be assumed that in Aristotle's view the only logical relation is that between genus and species. The distinction between extent and intent, on which later writers have laid stress, is never suffered in Aristotle to become a distinction in kind; the two elements, extent and content (*κατὰ παντὸς* and *καθ' αὑτό*), are always involved, and the difference is only in the process by which our knowledge is formed. Probably the relations of extent and content would never have been severed from one another had it not been for the error, almost a necessary failing in the attempt to treat formal logic systematically, of regarding notions and judgments as completely formed and defined products apart from the reasoning in which they appear (see, for a diametrically opposed view, Hamilton, *Lectures on Logic*, ii. p. 266).

and actuality, reflect themselves in the forms whereby subjectively knowledge is realised in us; and the resulting knowledge is conditioned partly by them, partly by the modes in which intellect as a reality is developed in us. The proposition has necessarily a reference to them; and thus, alongside of formal distinctions between universal, particular, singular, and indefinite judgments, we have the distinctions between necessary, contingent, and possible, which appear partly as given qualities of the judgment, partly as representing differences in the conditions of knowledge, partly as referring to differences of subjective apprehension.

The essence of the judgment as the apprehension of truth or falsehood consists in its twofold aspect as affirmative and negative, the former of these in a sense prior and better known, but the latter no less necessary, and both referring to objective relations of things. The affirmative and negative character of judgments, the essential ἀντίφασις of human thought, is further defined in reference to (*a*) the quantitative distinctions already recognised (the doctrine of logical opposition), (*b*) the distinctions of necessary, contingent, and possible, which are rightly regarded as real matters *about which* the assertion is,[1] and (*c*), consequent on this, the opposition of modal judgments.[2]

[1] On this account the *modality* is affirmed not to attach to the copula; thus the opposite of "it is necessary-to-be" is "it is not necessary-to-be," and not either "it is necessary-not-to-be," or "it is not-necessary-to-be."

[2] There are obscurities in Aristotle's doctrine of modals which remain even after Prantl's laborious treatment (*Ges. d. Logik*, i. 104-82). A careful survey is given in Rondelet, *Théorie logique des propositions modales*, 1861. The definitions of ἐνδεχόμενον and δυνατόν, which have given rise to much diversity of opinion (*cf.* Prantl, i. 167 *sq.*, as against Waitz, i. 376, and Bonitz, p. 387), are excellently dealt with by Ueberweg, *Logik*, § 69.

Propositions as integral parts of knowledge turn upon the ultimate relations of things known. The distinctions between first principles and deduced truths, out of which the theory of proof is developed, themselves rest upon those distinctions which have been already noted in treating of apodictic. Syllogism as the form by which the general and particular elements are mediated and conjoined is therefore of universal application, and may be analysed formally.[1] The various modes in which syllogistic inference, pure or modal, the main types to which these modes may be reduced, their relations to one another, and the general laws implied in them, are worked out in a fashion which does not admit of any brief statement. The conclusion unites the elements which in isolation appear in the premisses, and is, in a sense, the complex or organic whole unfolded in the syllogistic form. To every syllogism three things are necessary, the presence of a positive element, universality in one of the premisses (resting, as above shown, on the recognised property of all proof as involving a general fact), and *consequence*, or necessary connection between conclusion and premisses. Now from this third element there follow certain interesting deductions. The necessity of consequence rests on the very nature of syllogistic thought, and if each syllogism be taken as it stands, as a simple unit, no further inquiry is needful. But the character of the premisses in themselves may be taken into account, and we then discover that syllogism proceeds continuously on the assumption that the general law of syllogistic proof is in the special case realised. It need

[1] In this sense only can we recognise the distinction between Aristotle's *Technik* and his idea of *Apodiktik* on which Lange (*Logische Studien*, 1880) has laid so much stress. What underlies Aristotle's treatment must never be thrown out of account.

not be in fact realised. We may have premisses in themselves false, from which a true conclusion is reached, and the falsity of the premisses only becomes apparent when they are themselves treated as conclusions of a possible syllogism, and so the regress made towards ultimate principles.

Syllogistic form, in short, is the hypothetical application of the general rule of necessary connection between ground and consequent. If A (the premisses), then B (the conclusion). Quite possibly, then, we may have, in syllogistic form, conclusions drawn from premisses not *ἀναγκαῖα* but only *ὡς ἐπὶ τὸ πολύ*. Science and opinion (*δόξα*) are equally sources of propositions or premisses. If formal consequence be united with real uncertainty of matter, there arises a syllogism in character dialectical. Were the real uncertainty overlooked, the syllogism would be sophistic in character. Dialectical reasoning, then, dealing with the stage beneath science, may be of service, not only for practice in distinguishing true and false, but as bringing the particulars of each branch of knowledge into closer relation with the first principles special to that branch.[1] For wherever the particular element as such, the transitory and material, is present, there room is left for opinion, and reasoning is possible, not of the particular as such, but in so far as the particular manifests an underlying universal.[2] The processes of dialectic reasoning thus resemble very closely those modes by which the empirical detail, the region of given fact, is treated—viz., induction, example, use of signs and probable indications. For the universal has always its empirical side, and the complete process of

[1] *Topica*, i. 2, §§ 3-6.

[2] On this distinction *cf.* Kampe, *Erkenntnisstheorie d. A.*, pp. 252, 253; Heyder, *Method. d. A.*, p. 322.

scientific proof is a final result for which the way may be prepared by treatment, according to scientific form, of the empirical fact. There are syllogisms of fact as well as syllogisms of reason or ground, and the reason or ground becomes apparent through knowledge of the fact. Occasionally indeed the fact and ground are so immediately connected that transition from one to the other may be at once effected, but generally this is not the case.

Of these intermediate forms of reasoning, the only one calling for comment is induction, of the nature of which something has already been said. The obscure chapter in which the formal analysis of induction is undertaken, a chapter which has much exercised the ingenuity of commentators,[1] presents difficulties of various kinds. An opposition is indicated between syllogism and induction, yet induction is treated as a kind of syllogism; that is, freely interpreted, induction is so analysed as to show that in it, also, there is the union of general assumption and particular detail which is characteristic of syllogistic reasoning. Further, Aristotle seems to waver between induction as a kind of inference, through which we arrive at general principles, and as a species of proof, and his teaching is therefore perplexed by the want of some clear statement regarding a difficulty in the theory of induction, which is still far from perfect solution. For, according to Aristotle, induction as such, starting from the particulars of sense, and proceeding by comparison of similar cases and enumeration of all the similarly constituted members, never, even when the enumeration is complete, attains to probative force.[2] It

[1] *Anal. Pr.*, ii. 23. *Cf.* Whewell, *Camb. Phil. Soc. Trans.*, vol. ix., 1856: Hamilton, *Lectures*, ii. 358-62; Grote, i. pp. 268-74; Heyder, 216-26; Kampe, 189-92.

[2] On induction and recognition of similarity, see *Topica*, i.

is still a syllogism of fact, not of ground or reason ; there is a distinction of kind between the survey of empirical detail, even when complete, and the assertion of causal connection between the characteristics of the class and its deduced properties.[1] Thus, perception of the law (τὸ καθόλου) from induction is a kind of new element in the process ; it is recognition *by means of* the empirico-critical survey which is the essence of induction.[2] Induction makes clear only, and does not prove.[3] If we interpret according to more modern phraseology, this peculiarity may be expressed as the distinctive feature of inductive research based on facts or effects. We do not regard the inquiry as terminating in the establishment of a law until it is possible to reverse the process and show that from the surmised cause the effects do actually follow. Otherwise we have a conclusion of "coexistence" merely—an empirical rule or generalisation.

If, bearing in mind these sources of difficulty, and also the correlation which for Aristotle always obtains between empirical details and grounds of reason, we consider the example given in the obscure chapter before us, some light may be cast on the exposition there given. The example selected is one touched upon by Aristotle in other two

chap. 18, p. 108b 7 *sq.*; viii. chap. 1, § 14, and chap. 8, § 1 (in these last similarity is viewed as being wider in scope than the basis of induction). That induction implies a complete enumeration, see *Anal. Pr.*, ii. chaps. 23, 24 ; *Anal. Post.*, ii. chap. 7, § 1. That induction even when complete is not demonstrative, see *Anal. Post.*, i. chap. 5.

[1] On this distinction see mainly *Anal. Post.*, ii. 13, where a very fine description of deductive and inductive proof occurs.

[2] Compare the passages above noted, and see the curious expression used in the discussion regarding the relation of universal and particular in *Anal. Pr.*, ii. 21, p. 67a 22 *sq.*

[3] *Anal. Post.*, ii. 5, p. 91b 34, οὐδέ γὰρ ὁ ἐπάγων ἴσως ἀποδείκνυσιν, ἀλλ' ὅμως δηλοῖ τι.

pasasges, in the treatise *De Partibus Animalium*, and in the *Post. Anal.*, ii. 18.[1] As regards the first of these, reference is desirable only to bring out the fact that causal nexus is the καθόλου in question; the second is of the utmost importance as clearing up what has always seemed an obscurity in the account of the inductive syllogism. In the chapters 16-18 of *Anal. Post.*, ii., Aristotle considers the relation of cause and effect as the essential basis of proof, and he points out with much clearness the difference between the fact as cause of knowledge and the cause as ground of existence and proof. In some cases cause and effect are so united, so reciprocate, that we may infer from one to the other. But the doubt arises, may there not be more than one cause for any given attribute? in which case all such inferences from effect must become problematical. Aristotle's solution is remarkable, both in itself and in its bearing on the inductive syllogism. Suppose the attribute β is found in all individuals of a class A, and also in individuals of class B, C, &c. In order to discover the cause, investigations must be carried on until we have a defined number of classes A, B, C, &c., in all of which β is found, and which comprehend all cases of the presence of β. Then that which is also common to A, B, C, &c., may be regarded as the cause of β, say, *e.g.*, an attribute α. If this attribute α be really the cause of β, it will enter into its definition; it will be its definition. There might, however, be a connection of α and β of this universal and reciprocating kind, and yet α might not be the cause in question; it might be only a fact from which β could be inferred; the real cause γ, which gives rise to α, lies in the

[1] *De Part. Anim.*, iv. 2. *Cf.* Hamilton, *Lect.*, iv. p. 358, *n.* On *Anal. Post.*, ii. 16-18, see the valuable summary by Grote, i. pp. 366-68.

background. Characteristic of causation, then, is constant reciprocal conjunction of facts. Even if it be admitted, then, that there may be more causes for a phenomenon than one, it will yet be true that each of these causes will be manifested in one class of phenomena where there will be the universal reciprocating coexistence that is characteristic of the relation in question. Thus the attribute longevity observable in quadruped animals and in birds may be due to different causes, *e.g.*, to absence of gall in the one case, to predominance of solid, dry matter in the other. But in each case there will be a definite species characterised by the constant conjunction of the cause and the causatum ; the whole class long-lived animals and the class gall-less animals will coincide.

Turning now to the chapter on inductive syllogism, we find induction defined as inference through the minor that the major belongs to the middle. Here evidently major and middle are regarded not as determined by form only but as naturally distinct, and we must assume that by middle term is to be understood the ground or reason of the attribute (major term) characteristic of a defined species or group (the middle term). Were our knowledge complete and scientific, we should be able to express this in apodictic form: whatever animal has no gall is long-lived ; man, horse, mule, &c., are animals having no gall ; therefore they are long-lived. The progress of knowledge, however, may be from the empirical details. We may have given to us the fact of the attribute, long-livedness, in the group of animals, man, horse, &c., and discover that these long-lived animals are also wanting in gall. If, then, in accordance with the rules above sketched, there can be discovered a reciprocating relation between want of gall in animals and long-livedness, if we can constitute a class distinguished by

conjoint presence of gall-lessness and longevity, we have the basis for an inductive proof. We may infer therefrom that gall-lessness is, *in this species*, the cause of longevity. Such a reasoning is founded on particulars given, and as the coexistence is given, the conclusion seems to be immediately drawn; there does not appear to be mediation or use of a middle term; nevertheless the middle term is implied, not in the supposition that the two classes reciprocrate, but in the transference from empirical coexistence to causal nexus.

Aristotle's mode of stating this argument has presented so many difficulties of interpretation that various emendations have been proposed. Grote, *e.g.*, who has not apprehended why the class long-lived animals should be taken universally,—"we are," he says, "in no way concerned with the totality of long-lived animals,"—suggests an emendation, which makes the essence of the inductive reasoning turn upon the extension of what we know regarding some gall-less animals to all of that class. But this is not the inductive step according to Aristotle. Induction has not to prove or assume that α and β, found coexisting in some members of the species, coexist in all of them; Aristotle takes this universal coexistence for granted as the basis of the argument. The inductive step is the transference from this universal coexistence to causal nexus. Apodictically, we should say, if α is the cause of β, then all A which possesses α possesses β; thus reasoning from cause to causatum. Inductively we say, all A which possesses α has β; therefore α is the cause of β.[1]

[1] The following is the relative portion of chap. 23 of bk. ii. of the *Anal. Pr.*: "Now induction and syllogism through induction is the process of concluding by means of the minor term that the major term is predicable of the middle" (that is to say, of concluding from

Induction, as dealing with particulars, starting with the sense data, and resting upon the more evident fact in order to point towards the essential ground or reason, is therefore more persuasive, more palpable, more adapted for popular

given facts that an attribute found in all of them is the effect of some other attribute also found in all of them). "For example, if B be the middle term, A and C the extremes, we show, by means of C, that A is predicable of B; for this is the inductive process. Thus, let A be long-lived; B, those wanting gall; C, individual long-lived, as man, horse, mule. Then A is predicated universally of C" (that is to say, the attribute A is found in all the examples before us), "for also that which wants gall is long-lived" (that is to say, as a given fact, gall-lessness and longevity in the species, group, before us coexist). "B, wanting gall, thus is predicated universally of C. If then B and C be reciprocating, if C do not extend beyond the middle term" (that is, if we do not find other animals than the long-lived animals enumerated which also are devoid of gall), "it is necessary that A should be predicated of B. For it has been shown previously that if two terms are predicable of the same third, and if the extreme reciprocate with one of these, then the other of those predicates will be predicable of that with which the first reciprocated; but it is necessary to know that C is the complex of all the individual cases." The last sentence is extremely hard to interpret. The expression τὸ ἄκρον occurring in it is generally the technical word for major term, but as in the syllogism before us the major term is one of the predicates, this signification would seem to contradict the words πρὸς θάτερον αὐτῶν. Hamilton reads τὸ μέσον, which makes the argument intelligible and coherent with the passage apparently referred to in δέδεικται πρότερον—viz., *Anal. Pr.*, ii. 21, p. 68a 21-25. Probably Aristotle uses τὸ ἄκρον here as equivalent to C, the ἄκρον through which the induction proceeds. According to the view taken above, the essence of the Aristotelian induction does not at all lie in the universalising of C, but in connecting in one proposition the attributes B and A found to coexist in the group C. There is thus in one sense no middle, for cause is not reached; in another sense there is, for C is the material link connecting A and B. Aristotle then might naturally use ἄκρον for C, and assimilate the process of induction to a syllogism in which there was reciprocation of terms. In fact, however, induction regarded after his fashion results merely in the constitution of a group or class characterised as possessing two attributes in common.

inquiries, and relatively more apparent. Syllogistic proof, on the other hand, is more stringent, and more efficacious in establishing a scientific conclusion or position.

Aristotle's mode of dealing with induction, in so far at least as any specific process is designated by that term, seems on the surface to diverge widely from modern logical theory, and we look in vain in his analytical researches for consideration of the methods of observation and experiment which has come to be recognised as the essential portion of a doctrine of inductive reasoning. Yet it may fairly be argued that in modern theories the term induction is used with great laxity, so as to cover either all processes connected with scientific method or some one special feature of scientific reasoning, and that the difference between the Aristotelian and modern views lies mainly in the matter, not in the form, of the process. For there are numerous hints in Aristotle respecting scientific procedure,[1] and, if we consider what is peculiar to modern views, we shall find that it consists mainly in the increased fulness and complexity resulting from long-continued scientific research. Our modern logic of induction has profited mainly by the general advance of scientific method, and tends to increase as these methods, by constant contact with facts, become more refined and accurate. The additional cautions or limitations which we now introduce into our statement of the principles of inductive research concern not so much the form of inductive proof as the character and modes of obtaining evidence which is to satisfy the canons or rules of proof. Such limitations become apparent only through

[1] See, for example, the discussions in *Topica*, i. 17-18; ii. 10-11, on similarity; in the *Post. Anal.*, i. 13, on deductive and inductive methods; in *Post. Anal.*, ii. 13, on the formation of definition; and in *Post. Anal.*, ii. 12, 14-18, on the relation of cause and effect.

actual scientific progress, not by analysis of the form of scientific proof.

21. To Aristotle, as has been above said, proof is essentially syllogistic or deductive in character. Not every syllogism is an apodictic proof, but all proof is syllogistic. For proof or adequate knowledge is reference of effects to their causes, and the cause is the general element, τὸ καθόλου, which forms the middle term in apodictic proof. Now proof by means of the cause or reason implies the existence of the cause; the inquiry why a thing is is useless unless we know or assume that the thing is. If it exists, then the cause or reason of its so existing is that which gives it a definite character or position; it is, in technical phraseology, the form of the thing. But the form of the thing, regarded apart from the material, accidental element essential to its concrete existence, is that which we express in a definition. Proof and definition are thus most closely connected. The *terminus* to which proof tends, not realised in all cases of proof but certainly in the most perfect, is the definition; and, besides, if we closely examine proof, and find that ultimately we can force back the chain of middle terms up to certain ultimate, primary universals, disclosed by νοῦς, and that the nature of these primary universals is stated in their definition, we see further that definition is connected with proof as the *terminus* from which proof starts.

The exposition of definition is thus the crowning portion of Aristotle's theory of apodictic method.[1] In it we have

[1] It does not seem necessary here to consider in detail the peculiarities of apodictic as these are laid out in the first book of the *Post. Anal.*, nor to deal with the doubts raised regarding definition and proof in the first chapters of the second book. The substance of

brought into close, though not explicit, relation, the fundamental notions on which his logic rests—the notions of the essence, universal, genus and specific difference. Definition, as concerned with that which is involved in demonstration, the ground or reason, is, in cases where the reason and consequent are separable, the sum of the demonstration; it is the compressed statement of the connection between a subject and the attribute demonstrated of it, *i.e.*, in a syllogism of the first figure, the major term.[1] Frequently a definition merely states the demonstrated attribute in relation to its subject, without indicating the rational link.[2] Such definitions, however, are defective, just as the conclusion of a syllogism, if taken *per se*, is defective.[3] A genuine definition is the statement of the essence, which in mediated notions is the cause or middle term of the demonstration, in immediate notions is directly assumed.[4] A

these difficult chapters can be readily summarised. If definition be taken as a finished result, it seems to stand in no relation to proof, and indeed it is hard to discover how it comes about at all. For definition supposes that which is implied in proof, the existence of the thing defined, and, moreover, it is in a special sense a unity, containing no distinction of subject and predicate, whereas such distinction is of the very essence of a demonstrated proposition. Neither in province, nor in method, nor in result do definition and proof coincide. All this follows, however, from an abstract separation of the form or essence of the thing defined from the concrete nature of the thing. The essence is not to be taken apart; the definition does not pre-exist as a given fact. The essence is the reason of the fact, and is only discoverable when there is the recognised distinction of fact and reason of the fact. We must consider definition in the same manner as being involved in and resulting from the genesis of scientific knowledge.

merely nominal definition or explanation of what a name signifies is but a preparatory stadium in the progress towards real, genetic definition.

Definition, then, like demonstration, rests on the essential or rational ground, the notion of the thing. The rational ground or notion has its empirical aspect; it determines a class, and thus, just as in demonstration we may have forms of reasoning based primarily on the empirical details, so in framing definitions we may proceed from the empirical class, and may formulate rules for defining which bear special reference to the genus or body of individuals. In such procedure there is always involved the general idea of the essence or notion as the determining universal, and without this general idea the subsidiary methods, induction and division, do not yield scientific definition.

To frame a definition, then, *i.e.*, to discover the elements whose combination as an essential unity makes up the notion of the things defined, we select the predicates belonging to the things in question, but also attaching to other species of the same genus. The combination of such predicates which is not found in any other species, which is, therefore, reciprocable with the essence or form of the species, is its definition. The definition, therefore, contains the genus and the specific attribute (or combination of attributes). Of these elements, the genus is the least important; the truly essential factor is the specific difference, and, in order that our definition should be ultimate, we must follow out the line of specific difference by which a genus may be divided until we reach a final, irreducible characteristic or group of characteristics, constituting a lowest species (or natural kind, if one were to employ a term made current by J. S. Mill).

The systematic following out of the specific differences is

logical division; the critical comparison of points of similarity in species of the same genus, so as to obtain a higher generality, has no special title accorded to it, but it resembles the Socratic and Platonic induction (συναγωγή). Division preceeds on the oppositions actually found in nature; and though, doubtless, the division by dichotomy has formal advantages, it has not, as a process of real cognition, any supreme value. The negative as such is the inconceivable, and presents nothing for cognition.[1] And division is not dependent on exhaustive knowledge; it is not necessary that, in order to recognise A as distinct from B, we should know the whole universe of possible objects of cognition. A and B may be recognised as identical or distinct in essence, even though they at the same time possess distinct or identical accidental marks. Knowledge, in other words, turns upon the essential, not upon the numerical universal.[2] It is only needful, then, that in the systematic process of indicating the elements of definition, all must be included that concern the essence, that the order must be strictly from determining to determined (or from more abstract or general to more concrete or special), and finally, that the enumeration be complete. The final division or species reached is the notion of the thing, and its expression is the definition.

22. The analytical researches thus manifest themselves as a real theory of knowledge and as forming an integral

[1] Just as the ὄνομα ἀόριστον is said to have no significance save as the summary of a proposition, while a negative proposition has significance only in regard to the corresponding positive.

[2] The reference is to a theory advanced by Speusippus; see Prantl, i. 85. Aristotle here touches on a logical problem which has troubled many logicians. It is the same difficulty that arises when the question of plurality of causes is considered.

part of the Aristotelian system. Logical relations are throughout conditioned by the characteristics of the Aristotelian metaphysical conception, and the distinction of the formal or technical from the real in cognition has no place in them. No point is more frequently insisted on by Aristotle than the impossibility of deducing any scientific principles or results from the fundamental axiom of thought, the law of non-contradiction. In the Aristotelian system this axiom appears simply as the generalised expression for the peculiar characteristic of thought, its potentiality of truth or falsehood. Such potentiality accompanies thought throughout, and is the mark of its subjective character, but the actuality of thought is something quite distinct, and is only realised through the various processes whereby the world of fact is apprehended. Beyond a doubt knowledge has a general aspect; and there is thus possible a general theory of knowledge, but this is not to be regarded as merely a development from the fundamental axiom of thought. It is the general statement of what constitutes actual cognition, and thus refers on the one hand to the ultimate properties of that which is to be known, on the other hand to the qualities of knowledge as a subjective, though not the less real, fact. For to Aristotle subjective has not the sense which it may be said to have assumed in modern logic, mainly through the Kantian analysis. The activity of thought which realises itself in the consciousness of the individual is not a mere formal process of apprehension, mirroring or depicting reality that is totally distinct from it. It is a reality, one aspect or phase of the total sum of things, and its development is a real process correlative with the development inherent in things as a whole.

At the same time it is impossible to overlook the difficulties which attach to the Aristotelian conception,

and the consequent obscurities or perplexities in his logical researches. To remain always true to the fundamental conception of thought as one factor or phase in things, to trace its forms in such a mode as never to lose sight of its essential correlation to the development of reality, is in itself the hardest task for any thinker, and presupposes a more completed metaphysic than is to be found in Aristotle. Some of these difficulties may be briefly noted, as they form the turning-points of certain later doctrines. The judgment or proposition is taken as the initial, the simplest phase of the activity of thought, and so as having the simplest relation to things. But the distinctions of things which are subjectively seized in the judgment are too much regarded as given facts, and Aristotle is thus involved in a difficulty respecting the import, the truth or falsity, of the judgment. The presence of this difficulty is specially discernible when he attempts to deal with the temporal reference in the judgment, with the doctrine of opposition, and with the nature of modality. Thus, he notes that the verb, the essential part of the predicate, has a temporal significance, but he also notes that in universal judgments there is no reference to any specific time, and also that the copula, the verb *is*, has no existential meaning. He is thus driven to the enunciation of a view, common among recent logicians, that the judgment is a reflective or critical act, pronouncing on the truth or falsity of a contemplated separation or conjunction of facts, while, on the other hand, the very contemplation of conjunction or separation has appeared as the essence of the judgment. So, in dealing with opposition, he distinguishes contradictories from contraries, and is inclined to refer the second to the given nature of facts, wherein extreme oppositions of members falling under the same genus are presented. Modality, likewise, he treats

confusedly, for the assignment of the modal relations to the predicate does not sufficiently determine their place in a theory of judgment, nor explain the relation in which they stand to the judgment as the simplest activity of thought.

Further, in dealing with the quantity of judgments, Aristotle is perplexed by his own theory of what constitutes generality. He is compelled to throw together universal judgments of a totally distinct kind—empirical and rational, as one may call them,—and though the underlying view that empirical universality is the expression of, and is dependent on, rational connection is made sufficiently clear in the doctrine of proof, it is not carried out to its consequences in the doctrine of judgment. Finally, to note only the crowning difficulty, the theory of proof and of definition turns upon the nature of the essential connection of attributes in a subject, but the explanation of essence is precisely the lacuna in the system. Indications of a theory of essence are not wanting, but it does not seem possible so to unite them as to form a consistent whole. The greatest obscurity still hangs over the fundamental part of the system, the nature of the πρῶτα which are apprehended by νοῦς, of the specific relation of attributes καθ' αὑτά to their subjects, and of the ἴδιαι ἀρχαί from which particular sciences start. That the πρότασεις ἄμεσοι, so frequently adduced as integral parts of proof, are analytical judgments[1] cannot be accepted without such qualifications as to render the use of such a term misleading; but what their precise nature is remains in the Aristotelian system undetermined.

[1] As Zeller will have it; see *Ph. d. Gr.*, ii. 2, 191, *n.* Doubtless Aristotle does define an essential attribute as being one contained in the subject or one of which the subject notion is an integral part, but this relation of *entering into the definition* is not to be identified rashly with the modern view of the analytical relation of subject and predicate.

III

LOGIC FROM ARISTOTLE TO BACON AND DESCARTES

23. The long history of philosophic thought from Aristotle to the beginning of the modern period furnishes no new conception of logic so complete and methodical as to require detailed treatment, but exhibits alterations in special doctrines, additions, and new points of view numerous enough to account for a certain radical change in the mode of regarding logic which is, for our present purpose, the only interesting feature. This change may perhaps be expressed not inaccurately as the tendency towards formalising logic. Gradually logical researches came to have their boundaries extended in one way by the introduction of new matter, and narrowed in another by restriction of logical consideration to one special aspect of knowledge. Much in the history of this movement still remains in obscurity, but the general result is sufficiently clear.

The periods into which the historical development of logic throughout this long interval may be naturally divided, with their main characteristics, are the following :—

(1) *The Peripatetic School*, represented by Theophrastus and Eudemus, following in the main the Aristotelian

tradition, but deviating in certain fundamental respects, and on the whole treating the matter of logical research as though it were separate from and independent of the theory of knowledge as a whole. To this school is due the distinct recognition of the hypothetical and disjunctive proposition and syllogism, and the more complete enumeration of the possible valid modes of categorical reasoning. In both cases the additions are made to turn upon purely formal considerations. The hypothetical and disjunctive judgments are treated as given varieties, to be discerned in ordinary language and expression, not as resting upon any fundamentally distinct principle or activity of thought.[1] The addition of five indirect moods to those recognised by Aristotle as belonging to the first figure proceeds on the purely formal ground of difference in position of the middle term in the two premisses.

(2) *The Epicurean and Stoic Logics.* — Of these the Epicurean presents no points of interest. Logic, in their conception, was merely a practical theory of knowledge. The Stoic logic, on the other hand, is the first example of a purely formal doctrine based on and associated with a thoroughly empirical theory of cognition. In essence the Stoic doctrine is identical with that of Antisthenes, above noted, and it is interesting to observe that, under the purely nominalist theory, logic becomes almost identical with the doctrine of expression, or rhetoric. The theory of naming, and that of the conjunction of names in propositions, are the fundamental portions of the body of logic. Naturally

[1] The nature of hypothetical inference and its law are recognised with the greatest distinctness by Aristotle. From his theory of essence as causal nexus, any distinction of kind between an apodictic (categorical) syllogism and a hypothetical of the type contemplated by later logicians was impossible and needless.

the Stoic logicians tended to increase the bulk of logic by introducing numerous distinctions of language, and by signalising varieties of judgment dependent on varieties of verbal expression.

(3) *The acceptation of Logic among the Romans.*—Here there must be distinguished the quasi-rhetorical logic, such as is found in Cicero, which is altogether Stoic in character, and the Aristotelian logic, as developed by Boetius with the additions of the later commentators. In Boetius one notes specially the technical or formal character of the treatment, which was of special importance historically, from the fact that the earlier scholastic writers derived their main knowledge of logic from certain of the treatises of Boetius.

(4) *The Scholastic Logic.*—On the details of the scholastic logic it is not necessary to enter, but there must be noted the following points as of interest in determining what may well be called the current conception of the Aristotelian logic in modern times. The earlier scholastics, in possession of but few of Aristotle's writings, added nothing of importance to the body of logical researches, and the permanent subject of discussion, the nature of universals, did not, through any of its solutions, affect the treatment of logical doctrines. The introduction of the body of the Aristotelian writings was contemporaneous with the introduction of the Arab writings and commentaries into western Europe, and there grew up therewith a more developed treatment of what may be called the psychological element of logic. The logic of the later scholastics is characterised by two points of interest, historically unconnected, but having a natural affinity—the one, the introduction of an immense mass of subtle distinctions, mainly verbal, making up the body of the *Parva Logicalia;* the other, the influence of the

nominalist conception of thought.[1] The peculiarity of the nominalist view is the severance of immediate apprehension from discursive thought, the assignment of all matter of knowledge to the one, and of all form to the other. But form, under this conception of discursive thought, can be found only in the generalising function of signs or names; accordingly the fundamental processes of logical thought are regarded as so many modes of application of names. The later nominalist logicians were thus naturally led to the expenditure of immense subtlety and diligence on the thorny problems of the *Parva Logicalia*, while at the same time the peculiar inner difficulty of the theory became apparent as its consequences were worked out.

(5) *The Reaction against Aristotelianism and the Humanist Modification of Logic.*—Little of positive value for logical theory is offered by the numerous works representing this stage of historical development. Valla, Agricola, and Vives, with much good criticism in general spirit and detail, present a rhetorico-grammatical logic that resembles most closely Cicero's eclectic reproduction of Stoicism. Ramus, the only logician of the period with historic renown, contributes really nothing to the history of logic, his innovations consisting mainly in the omission of the most valuable portions of the genuine Aristotelic logic, the insertion of practical and interesting examples, and finally rearrangement or redistribution of the heads under which logical doctrine was expounded. The Ramist school, most numerous and flourishing, produced no logical work of the first importance.[2]

[1] The first of these is no doubt, as Prantl has laboured to prove, Byzantine in origin, but it still remains doubtful whence the Eastern logicians draw. The most probable source is the Stoic writings.

[2] See note C, p. 168.

The net result of this whole period was the severance of a certain body of doctrine, formal in character (the theory of second intentions), from theory of knowledge generally, and from all the concrete sciences. The boundaries and even the functions of this doctrine remained unfixed, for difference regarding fundamental points of extra-logical theory led to difference in mode of treatment, as well as to difference in conceptions of the end and value of logic.

IV

LOGIC OF BACON AND DESCARTES

24. Modern reform of logic, by which may be understood the attempt to place logical theory in a more close and living relation to actual scientific method, begins with Bacon and Descartes. To both the scholastic logic presented itself as the essence of a thoroughly false and futile method of knowledge. Neither had the acquaintance with the genuine Aristotelian system requisite in order to distinguish the elements of permanent value from the worthless accretions under which these had been buried, and, as a natural consequence, the views of both have a far closer resemblance to the Aristotelian doctrine than might be imagined from the attitude of opposition common to them. Both thinkers were animated by the spirit of reformation in science, and both emphasise the practical end of all speculation. For both, therefore, logic, which to neither is of high value, appeared to be a species of practical science, a generalised statement of the mode in which intellect acquires new knowledge, in which the mind proceeds from known to unknown.[1] But such a conception of logic is, if the expression be permitted, formal: that is to say, the actual province of logic is not determined thereby, but awaits

[1] Comp. *De Aug. Sc.*, bk. v. chap. 1, 2; *Princip. Phil.*, pref.

determination from the further idea of the nature of knowledge and the ultimate constitution of that which is to be known. When this point is reached, a radical divergence presents itself between the views of Descartes and Bacon, consequent on which appears a radically divergent statement of the main processes and methods of logical theory.

To Descartes the ideal of cognition is the mathematical, that in which from assured and distinct data we proceed by strict sequence of proof to determine accurately and completely the nature of complex phenomena. Such an ideal, extended so as to embrace knowledge as a whole, dominates the whole of the Cartesian speculation, and, as in the case of the Socratic doctrine of knowledge, is the ground of the Cartesian doubt. Perfect certainty, *i.e.*, clearness and distinctness of principles, logical consecutiveness of deduction from them, and exhaustive enumeration of details—such are the characteristics of completed knowledge. There follow naturally therefrom the main processes of knowledge: *intuition*, by which the simple data and axioms are apprehended; *induction*, or exhaustive enumeration of the elementary factors of any phenomenon; *deduction*, or determination of the complex as the necessary result of the combination of simple factors. To the processes of induction and deduction, when viewed more generally, the titles analysis and synthesis may be given.[1] On other portions of logical theory Descartes does not enter, and the text-books of the Cartesian school, even the celebrated Port Royal logic, do little more than expound with some freshness such of the older material as seemed capable of harmonising with the new conception.

[1] See *Regulæ ad directionem ingenii*, Nos. 2, 3, and especially 7. The celebrated rules of speculation (*De Methodo*) are only a more popular statement of the same processes.

Two things only require note in respect to the Cartesian logic, apart from its freshness and completeness : the one is the obscurity which hangs over the nature of intuition ; the other is the step in advance of the scholastic logic effected in the assimilation of deduction to synthesis. As regards the first, the criteria laid down by Descartes—viz., clearness and distinctness—are unsatisfactory and ambiguous. It is evident that he implied under these clear and distinct recognition of *necessity* in the data or principles, but the nature of this necessity is never made clear.[1] As regards the second, it was of importance to signalise, as against the scholastic view, that the universal in thought or reasoning was not only of the nature of the class notion, that genera and species were not the ultimate universals, but were themselves secondary products, formed by reasoning, and based upon essential connection of facts. In this Descartes was but returning to the genuine Aristotelian doctrine, but his view has all the advantage derived from a truer and more scientific conception of what these connections in nature really are.[2]

[1] His ultimate standard is, no doubt, necessity for a thinking subject. Whatever is so connected with the existence of the thinking being that without it this existence is incomprehensible, is necessary. But to apply this ideal to any proposition save the first, the *Cogito ergo sum*, is for Descartes the fundamental difficulty of his philosophy.

[2] It is remarkable, however, that neither in Aristotle nor in Descartes do we get many indications of any other kind of essential connection than that presented in the relations of geometrical or mathematical quantity. To both the type of exact reasoning is the mathematical. The difference between the two philosophers is but one example of what was previously remarked : that precise determination of the significance of processes of thought is dependent largely, if not mainly, on general advance in scientific knowledge. Descartes' conception of nature and of natural processes was in advance of the Aristotelian, and his conception of the method of thought by which knowledge is obtained is by so much clearer and profounder.

25. What is peculiar in the logic of Bacon springs likewise from the peculiarities of the underlying conception of nature. The inductive method, expounded in the *Novum Organum*, is, however, only part of the Baconian logic, and, since it is commonly regarded as being the whole, a brief statement of what Bacon included under logic may here be given.

Viewing logic as the doctrine which deals with the use and object of the intellectual faculties, Bacon divides it (in this approximating somewhat to the extended division of the Stoic logicians) into (1) the art of inquiry or invention, (2) the art of examination or judgment, (3) the art of memory, and (4) the art of elocution or tradition. The third and fourth divisions are unimportant; the first and second might be called respectively the theory of the acquisition of knowledge and the theory of evidence or proof. The art of inquiry is subdivided into the art of the discovery of arts and the art of the discovery of arguments. The second of these Bacon regards as identical with the *Topics* of the Greek and Roman dialectic, and therefore as of comparatively slight value. Of the first there are two main branches: (A) *Experientia Literata* and (B) *Interpretatio Naturæ*. The art of judgment has two sub divisions: the examination of methods of reasoning — induction and syllogism — which resembles the older analytic; and the examination of errors of reasoning— whether these be sophistical, *i.e.*, the logical fallacies of the older doctrine, or errors of interpretation to be removed by careful criticism of scientific terms, or arising from erroneous tendencies of the mind (the doctrine of *Idola*)—which resembles the older treatment of *Elenchi*.

The peculiarity of the Baconian logic, then, must be sought in the processes included under the art of discovering

arts or knowledge. Among these the syllogism is not included. It is a process with no practical utility; it involves premisses of which the truth is simply assumed, and consequently its conclusions can have no validity beyond that of the premisses; it affects to determine the particular from the general, but in fact nature is much more subtle than intellect, and our generalisations, which are but partial abstractions, are quite inadequate to afford exhaustive knowledge of the particular; it throws no light upon the essential part of cognition as a process information, viz., the method by which we are to obtain accurate notions of things, and judgments based on these notions. Moreover, the deductive or syllogistic procedure favours and encourages the tendency to rash generalisation, to the formulation of a universal axiom from few particulars, and to the uncritical acceptance of experience. If syllogism exist at all, there must be a prior process, that of generalising by rigid and accurate methods from experience itself. Syllogism is not entirely worthless. It is of particular service in some branches of science (*e.g.*, the mathematical), and generally may be employed so soon as the principles of a science are well established; but it is a subordinate and secondary method.

The art of discovery, then, is the method of generalising from experience. What this method shall be depends entirely on the thinker's conception of experience. Now Bacon's conception is perfectly definite. Observation presents to us complex natures which are the results of simpler, more general forms or causes. From the complex phenomena these forms are to be sifted out by a methodical process of analysis and experiment. A general proposition is one stating the connection between complex natures and their simple forms or causes; it is, therefore, the result of a

graduated process. No doubt there may be generalisations based only on an ingenious comparison of the complex phenomena as they are presented to us; such a process Bacon calls *Experientia Literata*, and the maxims recommended for it much resemble the ordinary methods of experiment; but truly scientific knowledge is only to be obtained by the complete inductive method.

The characteristics of this inductive method follow at once from the nature of the object in view. The form which is sought can be detected only by examination of cases in which the given complex effect is present, in which it is absent, and in which it appears in different degrees or amounts. By a critical comparison of these cases we may be able to detect, and, were the enumeration exhaustive, we must infallibly detect, by process of exclusion or elimination, a phenomenon constantly present when the effect is present, absent whenever the effect is absent, and varying in degree with the effect. Such a phenomenon would be the *form* in question—the cause of the given fact or attribute. Exhaustive enumeration is, of course, an ideal, and therefore the method of exclusion can never be perfectly carried out; but all additional aids have significance only as supplying in part the place of exhaustive enumeration. We may, on the basis of a wide examination, frame a first generalisation (*first vintage* as Bacon metaphorically calls it), and proceed to test its correctness by carrying out the critical comparison with it in view. Or we may, under the guidance of our leading principle, take advantage of certain typical cases presented by nature, or force cases by experiment, in such a way as to supersede the enumeration. There are *prerogative* instances, critical phenomena, helpful in discovery of the cause of a phenomenon. Of other *adminicula*, or aids to induction, only the

titles are given by Bacon, and it would be hazardous to conjecture as to their significance.[1]

The Baconian logic, then, or at least what is peculiar to it, is thoroughly conditioned by the peculiarities of the Baconian metaphysic or conception of nature and natural processes. As to the novelty of the logic, this to us does not appear to lie in the mere fact that stress is laid upon induction, nor do we think it correct to assign to Bacon the introduction of the theory of induction as an integral portion of logic. But it consists in the new view taken of what constitutes the universal in thought, a view which may be inadequate,[2] but which colours and affects every process of

[1] *Nov. Org.*, ii. 21. In addition to prerogative instances there are mentioned—supports of induction ; rectification of induction ; variation of the investigation according to the nature of the subject ; prerogative natures ; limits of investigation ; application to practice ; preparations for investigation ; ascending and descending scale of axioms.

[2] A word may be permitted on the objection so frequently raised against Bacon's method of induction, that its mechanical character not only fails to correspond to the actual process of discovery, but demands a wholly impossible enumeration of instances. It is not a little remarkable that this objection should be raised by any logician who accepts the empirical theory of knowledge, who holds therefore that, except in the case of facts immediately apprehended, we have only probability as our guide. For this is the very foundation of Bacon's doctrine. The exhaustive enumeration (*i.e.*, the immediate apprehension of all facts) is an ideal, but whatever falls short thereof, is not exact knowledge, and must be dealt with by other methods. The tables of presence, absence, and degree are no more the whole of the Baconian theory of induction than are the four experimental methods the whole of Mill's doctrine of inductive proof, though a similar misconception is not infrequent in respect to the latter also. Bacon is perfectly conscious of this defect in his method : he advocates the use of hypothesis, though it is hardly surprising that, with certain current hypotheses before him, he does scanty justice to this potent instrument of research ; and almost the whole exposition of the inductive method is concerned with one of

thought, and therefore every portion of logical theory. It is but a consequence of Bacon's narrow view of the essence of syllogism that he should set induction in opposition to deduction, and regard syllogism as of service only for communication of knowledge. His inductive methods are throughout syllogistic in this respect, that they like all processes of thought involve the combination of universal and particular. Experience is interpreted, that is to say, viewed under the light of a general idea or notion.

the processes supplementary to and necessitated by the impossibility of realising exhaustive enumeration. The names of the other supplementary processes contemplated by Bacon at least suggest many of the methods which have been brought forward in recent logics as antithetic to the mechanical induction of the *Novum Organum*.

V

LOGIC ON THE BASIS OF PSYCHOLOGICAL EMPIRICISM: LOCKE, HUME, MILL, CONDILLAC

26. The universal element in thought which is recognised by Bacon as present received from him no special treatment. His theory of the nature of knowledge offered no explanation of the origin, significance, and validity of the notions involved in inductive procedure. The *Essay concerning Human Understanding*, which carries out in the domain of inner experience the practical tendency of the Baconian method, supplied from the point of view of individualism the metaphysical theory common to both, a certain psychological theory of the universal element in knowledge, and thereby afforded a new foundation for logical doctrine. The *Essay* contains, in an unsystematic fashion, much that bears directly on logic (*e.g.*, the whole discussion on names, the classification of the signification of judgments, the criticism of syllogistic argument); but of more importance than these detached and direct portions is the general principle which underlies the whole view of human knowledge. This principle is briefly that of psychological genesis. All the complex facts of knowledge are regarded as mechanical compounds due to the coherence of simple data, the facts of inner and outer sense. It is

true that Locke's effort to carry out the view is full of difficulty and even of contradiction; it is true also that the specifically logical processes of judging appear, without any warrant, as reflective acts exercised upon the materials furnished by sense, and that generally there is no attempt made to push the ultimate explanation further than to the very complex fact of an individual mind endowed with a multiplicity of powers, by means of which it brings into the isolated impressions of experience the order and logical coherence which are the very characteristics of knowledge. Nevertheless, the method of Locke is that which underlies and determines all the logical work of one very important school of logicians.

It is not needful to enter into details of Locke's own contributions to the foundation of logic. But it may be pointed out that from his position there were two possible lines of development. In his view the primitive impressions, the facts of inner and outer sense, were in themselves primitive facts of cognition; they were cognitions (it is the very essence of Locke's method to identify a simple impression of sense with the knowledge of a simple sense fact). The processes of abstraction, comparison, *i.e.*, judging and reasoning, were exercised upon their data, and these products were, in consequence, of a secondary and, so to speak, artificial character. It was natural that a thinker who identified impression of sense with knowledge of a sense fact should maintain that the secondary formations of thought (general ideas, general propositions, syllogism) were not indispensable for cognition; that we could and did reason from particulars to particulars. At the same time Locke admitted the secondary processes as having actual existence, and in one important case (that of the judgment of coexistence, with which may be taken

the idea of substance and of real relation) seemed to allow that in judgment something was added to the primitive data. It was possible, then, for development from Locke's position to proceed either by offering an explanation of the added elements, which should be in stricter harmony with the fundamental doctrine of psychological genesis, or by throwing them entirely out of account and concentrating attention on the primitive data as the only materials of cognition. The first is the line taken by Hume, which finds its logical completion in Mill; the second is the line taken by Condillac.

Hume has an easy task so long as he merely subjects Locke's position to negative criticism; for the added elements, the ideas of substance, relation, cause, &c., are clearly inept and defenceless when the facts to be linked by them are already contemplated as so many completed, isolated cognitions. But where connectedness of cognition is in question, and where some explanation is demanded of the relations which seem to supply the universal rule in thinking, Hume's task is not so simple, and his final answer that these relations are psychological growths or products of association is neither satisfactory in itself nor quite in keeping with other portions of his doctrine. In Hume, however, we find the first thorough-going attempt to construct a theory of knowledge on the basis of psychological empiricism or individualism, and the first contributions to a doctrine of inductive proof as portion of this more comprehensive theory.[1] Briefly, so far as logic is

[1] It seems hardly necessary to call attention to the points of similarity between Hume's expressions on logical questions and the allied opinions of Mill. But there may be specially indicated for comparison the classification of kinds of knowledge implied by both (intuition or immediate apprehension, proof, and probable reasoning), and Hume's remarkable, thoug brief, statement of the rules for

concerned, Hume offers as explanation of the universal in thought association of ideas, but does not treat of logic specially or in detail.

The complete statement of the theory of knowledge from the psychological point of view is that contained in Mill's *System of Logic*. This well-known work, which has contributed much of value to general logical discussions,[1] is a complete exposition of all the processes concerned in the formation of knowledge, from the individualist standpoint. It is therefore to a large extent polemical, or, at least, animated by the spirit of defence against attacks on the fundamental position. The purely expository portion, however, contains the logical theory of psychological empiricism in a form which may fairly be regarded as final.

The aim of the work is the exposition of the theory of knowledge. Now knowledge, the term being taken in a wide sense, is characterised by one quality mainly, viz., evidentiary force. For every item entering into the sum of our beliefs at any moment, immediate perception being discounted, there may be reasons advanced, adequate or inadequate. The exposition of the relations between beliefs and their evidence or ground is logic; and logic is thus in one sense formal, inasmuch as the relations of evidence and belief are general, not dependent on the special nature of the facts believed, and in another sense

reasoning with regard to causation. These rules contain in essence the inductive methods. The matter, however, is only of historic interest, for the originality of Mill's treatment of the empirical logic is in no way affected by similarity between his ultimate philosophical views and those of Hume.

[1] The treatment of logical problems, such as the significance of the proposition, the theories of division and definition, is always instructive. But upon matters of detail the present discussion does not profess to enter.

real, in that knowledge is conceivable only in strictest relation to the things known.

Now, the exposition of the general nature of grounds of belief, while it implies a statement of the modes in which data and conclusions are expressed, and a reference to the nature of that which is expressed,[1] is in fact identical with a theory of the universal element in thought or cognition, and this theory is the essential portion of Mill's logic. It being assumed that the facts with which knowledge is concerned are minds, bodies, states of consciousness, and the relations (coexistence, sequence, similarity) among these states, and that propositions express, therefore, existence, coexistence, sequence, or resemblance, on what is based any inference going beyond a present perception? The propositions which make up cognition, strictly so called, are not mere expressions of momentary states; they are expressions of belief regarding the more or less constant relations of facts. They are, in fact, conclusions. The theory of proposition and of reasoning is one. On what, then, do such conclusions rest?[2]

The warrant for any conclusion based upon experience, and referring to experience itself, can be found only in experience or in some principle furnished by experience. It may be shown that evidence for a conclusion is adequate, if we can compare this evidence with the kind of evidence on which a wider conclusion, frequently or constantly verified, rests. This comparison of particular evidence

[1] The theories of naming and of propositions.

[2] Any references, in the discussion of so fundamental a problem, to empirical constancies, to the universality of extent or fact, as opposed to universality of intent or essence, are beside the mark. Nor is it advisable, in considering Mill's solution, to follow the order of exposition in the *System*, which proceeds by assuming a form of the solution which is to be afterwards justified.

with mere general evidence is the preliminary answer furnished by Mill. But what is the general evidence referred to, and what is the principle founded on it? The general evidence is the repeated experience of constancy of connection among groups of phenomena, and the principle founded on it is that of the existence of uniformity or rather of uniformities in nature. The evidence and the principle are purely psychological in character; that is to say, repeated experience, beginning with familiar cases and extending itself as time goes on, produces, by the natural laws of association, an assured belief that phenomena as a whole, or at least in the main, are connected together in constant, uniform, invariable modes. Such a belief, once established, serves as an ultimate criterion of proof, and as an index for research. We proceed in our investigations in the light of this principle, and the tests by which we estimate the validity of evidence for any particular inference as to uniformity are generalised statements deducible from it. So soon as our evidence is of such a character that, in the case before us, either the inference of uniformity is warranted or the general principle must be held not to apply to this particular case, we have proof as cogent as experience can afford.[1]

The universal in knowledge, then, is this naturally formed assumption regarding the course of nature. The logic of knowledge is the exposition of the modes in which evidence is obtained, of the tests by which its validity is estimated, and of the forms in which evidence and conclusion are connected.

The characteristic features of the subordinate processes

[1] It would have added to the clearness of Mill's exposition of induction (*System of Logic*, book iii.) had the word *cause* been entirely omitted. Nothing but confusion arises from its use.

of proof are at once deducible from this fundamental view. For if the simplest form of inference be, psychologically, the transition effected by association from one particular case to another resembling it, and if the essence of proof consist in comparison of the evidence for any one conclusion with the type of evidence for the general assumption regarding nature (or at least a wider portion of nature), it is evident that syllogism, in the ordinary acceptation of the term (in which it implies a concrete general proposition, a particular subsumed thereunder, and a conclusion), is neither a primitive form of inference nor a valid mode of proof. Doubtless we do in reasoning employ general propositions in order to express the determination of some particulars belonging to the same class; but the general proposition is itself a conclusion, resting on evidence of the kind above described, and the essence of syllogistic reasoning is not the subsumption of a particular under a general in which it is included, but the expression of belief that the evidence for the general proposition is adequate to cover all the particular cases, including those which have not been taken into account in formulating it. The major premiss of a syllogism is the record of a previous induction; and the syllogistic process, bringing forward a new case, is a valuable method for testing the adequacy of the previous generalisation. As to generalisation itself, the basis is evidently to be sought in experience, apprehended by observation and experiment. Did experience present to us isolated phenomena, *i.e.*, phenomena so arranged that enumeration of the elementary constituents, whether antecedents or consequents, were possible, then our inductive procedure must be regulated by those canons or axioms which express the kind of evidence already referred to as establishing uniformity.

These canons or axioms, however, are, like the Baconian method of exclusion, tests for an ideally perfect experience, and they, therefore, only lie in the background of actual scientific procedure, which has to employ other processes both of inference and of proof. For, if we can in no way obtain more than a knowledge of the coexistence of facts, we are unable to bring our evidence into conformity with the inductive canons, save in the ideal instance in which absolutely exhaustive experience both of positive and negative cases is possible. Inferences as to law or uniformity of coexistence must here be based on numerical calculation of probability, and the conclusions present themselves in the peculiar numerical form appropriate to propositions of probability. Further, if the phenomena under investigation be complex, so that the canons of neither observation nor experiment are immediately applicable, the process of investigation must of necessity be the combined method of analysis and synthesis: analysis, aided by hypothetical conjecture, formulating such general laws of elementary factors as are known or presumed to exist in the case in question; synthesis, combining these laws and calculating with greater or less numerical exactness, according to the nature of the matter, the probable combined effect — the whole tested by critical comparison of the calculated result with the actual phenomena. Here, as one can see, syllogistic procedure appears in its true scientific aspect as the form of thought by which we pass from the simple to the more complex, from the elementary essence or cause to the complex accident or effect. The elementary causes, no doubt, have no more cogent evidence than that which can be afforded by experience viewed in the light of our psychological assumption of uniformities; nevertheless the whole procedure of scientific investigation

is recognised as being essentially of the type sketched in somewhat imperfect outline by Aristotle.

So far, then, as the logic of Mill is concerned, and apart from the undeniable richness and completeness of knowledge with which the various processes are treated, we note but one fundamentally new feature, namely, the explanation offered of the universal element through which alone perceptions are raised into cognitions, through which alone reasoned knowledge is possible. It is the only explanation possible on the basis of psychological individualism; its value, and therefore the value of the systematic deductions from it, must depend on the accuracy and coherence of the psychological or metaphysical theory on which it is founded.

27. It was possible, however, to proceed by another route from the position taken up by Locke. If it be held that the elementary impressions, mechanically regarded as somehow arising in mind, are in themselves cognitions, then it is possible to view them as containing in themselves all possible cognition. In other words, we may confusedly identify the proposition that knowledge does not extend beyond the field of experience with the very different proposition that the only items of knowledge are the isolated impressions which appear to make up experience. If this identification be accepted (and the conception involved is precisely that underlying all consistent nominalism from Antisthenes downwards), then the only processes requiring to be taken into account are those whereby clearness and distinctness are introduced into our (possibly) vague perceptions. For these processes analysis is an adequate title. All knowledge, *i.e.*, whatever is characterised by clearness, definiteness, consequence, is the analysis of what is given

in isolated perceptions. Each perception is itself and is only itself; no judgment is possible save that of identity. In other words, if there be judgment at all, it can consist only in the assertion that the unanalysed perception is identical with that into which it is analysed, and as each perception and each analytic portion of a perception may be signified by an arbitrary sign (name or other hieroglyphic), judgment is essentially an affair of naming, a declaration that different names are identical or belong to the same perception. Reasoning is simply the transition from one identity to another—a more developed result of analysis. Scientific or real knowledge is an accurately framed system of signs, *i.e.*, a collocation of signs which expresses precisely the results of the analysis of complex perceptions. Logic, under this doctrine of knowledge, is merely a statement of the various modes in which analysis is carried out, of the ways in which names are applied, and of the forms in which names are combined. Such is the theory of logic presented by Condillac.[1]

VI

LOGIC ON THE BASIS OF METAPHYSICAL PSYCHOLOGY: LEIBNIZ AND HERBART

28. One development from the psychology of Locke has thus appeared as an extreme formalism, which if carried out consistently must needs assume the aspect of a numerical or mechanical system of computation.[1] It is remarkable that a very similar result was reached by Leibniz, a thinker who proceeded from a quite opposed psychological conception. The idea of logic, or rather the hints towards a new view of the essence of logical processes, to be found in various tracts by Leibniz, must be taken in close relation to the metaphysical psychology which lay at the root of all that thinker's speculations. We shall probably be able to see that the similarity is due to the presence in both theories of a certain abstract principle, intimately though not necessarily connected with the respective psychologies.

It is not needful to enter into an elaborate survey of Leibniz's metaphysical psychology: the main features which have reference to logical processes alone require to be taken into account.

[1] Such as is hinted at by Hobbes, and as is carried out in the various works of Jevons.

Ultimate reality or substance strictly so called is to be found only in the qualitatively distinct, active, indivisible monad, incessantly changing or developing. Such incessant change, a condition in which there is both difference and identity, is only conceivable if the essence of the monad be regarded as representative activity, as psychical in character. The life of the monad is thus an incessant self-development, in accordance with the laws of its own nature and of the universe. The existence of the monads is dependent on the absolute thought of God, from whom they have sprung, and whose objective thought is the universe. The system of representations which develops in each monad is in one sense subjective (each monad is a universe to itself), in another sense objective in that the development of all must proceed in the strictest harmony with the objective thought of God. Finite monads develop in varied degrees; all of them have psychical life of a kind, but only in the higher monads is there reflective consciousness (apperception) resting upon and implying a certain clearness and distinctness of perceptions. From the very nature of the finite monads, their apperception is subjected to two fundamental laws: identity or non-contradiction and sufficient reason. For as they are finite, each representation must be treated by them as requiring a ground or reason for its reality; as they are conscious of their own identity, no representation can be for them possible which contains contradictory marks. To introduce system into the conscious life of the monad, *i.e.*, to produce science, it is needful to treat every representation as a conditional fact to be referred backwards to distinct, identical grounds or reasons. All truths are ultimately identical, but this identity is not always evident to the finite monads. Only God possesses clear and distinct

knowledge of all propositions: only in Him are all truths identical. To finite intelligences some truths are manifest; others (truths of fact, empirical cognitions) are obscure, and the attempt to trace them back to ultimate principles may be one which cannot be completely realised. The *prima possibilia* may not be attainable for all actual phenomena.

In place of the single perception which in Condillac's logic is the element to be analysed, there appears in Leibniz's view the single consciousness of the monad; in both cases, however, knowledge is assumed to exist there implicitly and to stand in need only of evolution. The methods by which this evolution is to proceed form for Leibniz the substance of a new and all-comprehensive science, "Scientia Generalis," of which the older logic is but a part.

The characteristics of Scientia Generalis are at once deducible from the two general principles which in Leibniz's view dominate all our thinking—the law of sufficient reason and the law of non-contradiction. It must contain a complete account of the modes in which from data conclusions are drawn, and in which from given facts data are inferred; and since the only logical relations are those of identity and non-contradiction, the forms of inference from or to data must be the general modes of combination of simple elementary facts which are possible under the law of non-contradiction. The statement of the data of any logical problem, and the description of the processes involved in combining them or in arriving at them, are much assisted by, if not dependent on, the employment of a general *characteristic* or symbolic art.

The fundamental divisions then of Scientia Generalis, so far at least as its groundwork are concerned (for Leibniz sometimes includes under the one head all possible applica-

tions of the theory), are (1) the synthetical or combinatorial art, the theory of the processes by which from given facts complex results may be obtained (of these processes, which make up general *mathesis*, syllogistic and mathematical demonstration are special varieties); (2) the analytic or regressive art, which starting from a complex fact endeavours to attain knowledge of the data from whose combination it arose.[1]

Of the nature of the second portion only a few brief indications are contained in the logical tracts and in detached utterances in the larger works of Leibniz. When complex combinations are presented, or, in the most general form, when the investigation has to start from experience, from truths of fact, the work of analysis is endless; the regress to conditions is practically infinite. Determination of the necessary data cannot in such a case possess more than probable value, but the probabilities may be estimated according to the rules laid down in the progressive or synthetic art.[2] The logic of probability is thus recognised as an integral portion of the logical system.

Of the first art, the logical calculus in particular, a somewhat clearer and fuller outline is given.[3] The logical calculus implies (1) the statement of data in their simplest form, (2) the assignment of the general laws under which combination of these data is possible, (3) the complete

[1] Leibniz sometimes includes these two under the head of "Ars Inveniendi," and places alongside of this, as first part of Scientia Generalis, "Ars Judicandi," a division resembling that appearing in Bacon; but the "Ars Judicandi" may be thrown out of account.

[2] *Op. Ph.* (ed. Erdmann), pp. 397, 398; *cf.* generally pp. 84, 93, 343.

[3] See specially *Op. Ph.*, pp. 92-114; also the tract "De Arte Combinatoria," *Op. Ph.*, pp. 6-45.

exposition of the forms of combination, (4) the employment of a definite set of symbols, both of data and of modes of combination, subject to symbolic laws arising from the laws under which combination is possible. In the *Fundamenta Calculi Ratiocinatoris* and the *Non inelegans Specimen Demonstrandi*, something is effected towards filling up the first, second, and fourth of these rubrics, but in no case is the treatment exhaustive. The simple data, called characters or formulæ, are symbolised by letters, relations of data by a somewhat complicated and varying system of algebraic signs; for the calculus, or set of operations exercised upon relations given so as to produce new formulæ, no comprehensive system of symbols is adopted. Formulæ, relations, and operations take the place of notions, judgments, and syllogism. The general laws of combination of data are stated without much precision. Leibniz recognises the law of substitution, notes also what have been called the laws of reduplication and commutativeness, but, in actual realisation of his method, employs indifferently the relation of containing and contained or the relation of identical substitution (æquipollence). No attempt is made to develop a complete scheme of possible modes of combination.[1]

At the root of Leibniz's universal calculus, as of Condillac's method of analysis, and generally of nominalist logic, there lies a peculiar acceptation of the abstract law of identity. That a thing is what it is—that knowledge of

[1] It is interesting to note that Leibniz signalises the distinction between the logical and mathematical senses of a whole, and between the distributive and the collective meaning of quantity; that he emphasises the function of the particular judgment as the negation of its opposed universal; and that he approximates to some modern modes of formulating the judgment (*a* is *b*, *e.g.*, he would express as $a = ab$, or *ab* is; no *a* is *b*, as *ab* is not).

a thing is a single, indivisible, mechanical fact, susceptible only of explication or of expanded statement—this is the principle dominating logical theories which in other respects may differ widely. Insistance upon this aspect of knowledge or of the object known is the ground for assigning to thought a function purely analytic, which is the very keynote of nominalism. It is not hard to see, however, that so to view the law of identity is to abstract from all the conditions of actual thinking and knowing, and to throw into the assumed simple fact all the complexity which is afterwards to be discovered in it by analysis. The knowledge of a thing is not to be explained in this abstract or mechanical fashion. Truth does not consist in the empty recognition that a is a, and in the repetition of this unimportant fact, but in the knowledge of the nature of a, a knowledge which essentially consists in relating a to its intellectual conditions, in assigning to it a place in the intelligible world. The identity of the thing with itself is a mere aspect of the complex process whereby the thing is cognised. It hardly requires to be pointed out that the minor forms of the same fundamental view, the various attempts to express the essence of a judgment as the assertion of identity, are open to the same objection. They take an abstract view of the judgment, and regard as the essential fact that which is but an accessory or adjunct or consequence. Difference, to put it in the briefest fashion, is no less essential to a judgment than identity.[1]

[1] Much of the confusion which reigns supreme in many modern works on logic is doubtless attributable to a confusion between the nature of the judgment and the result of a judgment. The result of a judgment is always an increased richness of the subject notion; the subject unqualified and the subject qualified by the predicate are doubtless identical; but it would be absurd to say, therefore, that the function of the judgment is the assertion of this identity.

29. The view of logic put forward by Herbart, from a metaphysico-psychological basis resembling that of Leibniz, agrees in so many respects with that of Leibniz, although containing no reference to the idea of a logical calculus, that it may be placed under the same head. Logic, according to Herbart, is a purely formal doctrine; it has to do only with the modes by which clearness, distinctness, and system are introduced among our ideas. Logical forms, then, the notion, judgment, and syllogism, are not to be regarded as having any metaphysical reference; they are not even to be explained psychologically; they stand on their own footing as explanatory processes exercised about the representations which under their own natural laws fill up consciousness, coming and going within the sphere of apperception.[1] According to this view the whole province of knowledge is excluded from logic, and it is assumed that knowledge is somehow given, mechanically, without the co-operation of processes, if not identical with yet strongly resembling, those recognised as logical. Herbart does not succeed in vindicating an independent place for a purely formal logic.

[1] There is a certain inconsistency in Herbart's view of logic, inasmuch as logic is not the only discipline which has to do with clearing up our ideas. Metaphysics has specially to clear up fundamental contradictions in notions furnished by experience. Logic then must be in some way restricted so as to fall beyond the sphere of metaphysics. Probably the mark of restriction would be found in the given character of the ideas; logic considering them simply as they are and dealing with the relations in which they as given may stand to one another, while metaphysics has to examine the significance of certain notions for our thinking and to clear them up in this particular reference.

VII

THE KANTIAN LOGIC

30. The critical method, which has so influenced general philosophy that all later speculation refers more or less directly to it, has at the same time profoundly modified all later conceptions of the sphere and method of logic. From the Kantian philosophy there spring directly the three most important modern doctrines of logical theory: that which, with many variations in detail, regards logic as a purely formal science, the science of the laws of thought or of the laws under which thought as such operates, and of the forms into which thought as such develops; that which, likewise with many variations, unites logical doctrines with a more general theory of knowledge; and finally, that which identifies both logic in the narrower sense and theory of knowledge with an all-comprehensive metaphysic. Indeed the grounds of distinction between the several doctrines thus brought into connection, and the significance of the terms by which they are expressed, are intelligible only when taken in reference to the Kantian system. The peculiar sense attached to the term thought (from which follows naturally the formal view of logic), the opposition between thought and knowledge (upon which rests the distinction between logic and theory of knowledge), the

ultimate idea of the relation between thought, knowledge, and reality (upon which might be founded a distinction between logic, theory of knowledge, and metaphysics), are all Kantian in origin.

It is matter of history that the critical system was developed mainly from the basis of the Leibnizian logical and metaphysical theories, and it is likewise matter of history that Kant, even in the speculative work which was to so large an extent antagonistic to these theories, remained under the influence of some of their cardinal positions. In particular the view of logical thought as purely discursive, analytic in character, a view never by Kant harmonised with his general system, is a relic, most significant for the development of his logic, from the Wolffian reproduction of Leibniz's philosophy. This historic basis is not to be lost sight of in attempting to acquire a clear idea of the special place and function assigned by Kant to logical theory.

But a brief reference to the general result of the critical philosophy will suffice to introduce the more special treatment of the Kantian logic. Knowledge, or real cognition, which is analysed in the *Kritik* in reference to its origin and validity, appears, when subjectively regarded, as a compound of intuition and thought, of sense and understanding. The isolated data of sense experience do not in themselves form part of cognition, but are only cognised when related to the unity of the conscious subject, when the subject, as it may be put, has consciousness of them. This reflex act, resembling in some respects Leibniz's apperception, or process of uniting in consciousness, is an act *sui generis*, not to be mechanically conceived or explained. Only through its means do representations become cognitions. The forms in which the synthetic act of understanding is carried out

are, as opposed to the intuitive data on which they are exercised, discursive or logical in character. Essentially they are judgments: all acts of understanding are judgments, and, as judgments, they imply a general element with which the particular of sense is combined, and in the light of which the particular becomes intelligible.

In ultimate analysis it appears that no particular, whatever be its empirical character, can become an intelligible fact, save when determined through some specific act of understanding, through combination with some specific notion or general element. Combination of particular and general is thus the very essence of understanding, the mark of knowledge as such. In every item of cognition the same elements may be discerned as necessarily present. The consideration of the ultimate modes of intellectualisation, of the series of acts by which understanding subsumes the particular, draws the particular into the unity of cognition, may be called in a large sense logic. If the consideration be specially directed to the mode in which, by means of this combination, knowledge arises, and therefore include discussion of the wide problem regarding the relation between understanding and objectivity in general (the matter of knowledge taken generally), the special title transcendental logic may be used. But if, concentrating attention solely on the kind of operation implied in understanding, we endeavour to lay out fully the modes in which understanding proceeds in the construction of knowledge, making abstraction of all inquiries regarding the origin, worth, significance of knowledge itself, the consideration is of a more general character, and may receive the title of general logic.[1]

[1] It does not seem necessary to advert more in detail to the divisions and subdivisions of logic drawn out in the *Kritik*, pp. 86-93 (Hartenstein's ed., 1868).

The understanding then, like everything else, works according to laws, the laws of its own nature. If we abstract from all that may characterise the matter considered, and take into account solely the laws according to which understanding must act, we may construct a purely formal doctrine, a theory which is rational both in matter and in form: for the matter consists of the laws of reason, and the form is prescribed by the very nature of reason,—a demonstrative theory, for nothing can enter therein which cannot be shown to have its ground in reason, —a completed theory, for although the matter of thought is infinite and infinitely varied, the modes in which the understanding must operate if unity of cognition is to result, are finite and capable of exhaustive statement,—and a theory developed from its own basis, standing in no need of psychology or metaphysics, but deducible from the mere idea of understanding as that which introduces unity into representations, whether given (empirical) or *a priori* (pure).

Were this the only determination of the province of logic given by Kant, the question which at once arises as to the possibility of any such independent doctrine would receive an easy solution. For it is evident that logic, as a theory of the form of thought, could consist only of a portion of the more general doctrine, by whatever title that be known, in which the nature of understanding as synthetic activity is unfolded. The distinction on which Kant lays stress between matter and form, a distinction employed by all subsequent writers of his school, is ambiguous and misleading. If by matter be meant the particular characteristics of the things thought about, in which sense we might speak of judgments of physical, chemical, grammatical matter, and so on, then to say that logic does not take this into account

is perfectly inept. If logic be a philosophic discipline at all, a theory in any way concerned with thinking, it is at once evident that it can in no way deal with the specialities of any particular science. But this distinction between matter and form is by no means identical with another, lying in the background, and too frequently confused with the first—the distinction of understanding as a faculty *per se* with its own laws, deducible from its mere notion, and understanding as the concrete real act of thinking. What Kant calls the mere idea of understanding, and what in other writers of his school appears as a definition of thought, is really nothing but a reference to what has presented itself in the wider inquiries of the *Kritik* as the complex nature of the synthetic activity of understanding. Kant himself never attempts to deduce from the notion of understanding the varied characteristics of logical forms, and his followers —*e.g.*, Hamilton — when they are consistent, start from concepts as expressing the bare notion of thought, and regard all other forms of thought as combinations of concepts.

But Kant does introduce another element into his treatment of the province of logic, one not original to him, but of the utmost importance for later developments from his point of view. He inquires what kind of relations among the elements of thought can form the matter of logical treatment, and defines these as two in number—(1) formal consequence, (2) non-contradictoriness. By formal consequence we are to understand the relation between a conclusion and its premisses, no inquiry being raised as to the truth or validity of the premisses. By non-contradictoriness we are to understand that, logically, notions, judgments, or reasonings can be subjected to treatment only in regard to the absence of explicit contradiction among the factors

entering into them. Thought, which introduces unity and system into experience, must certainly introduce formal consequence and preserve analytic truth or correctness. Formal logic, then, treats only of these formal qualities of all products of thought.[1]

The detailed treatment of logic, so far as that can be gathered from the very brief summary given in his *Logik*, shows with the utmost clearness how impossible it was for Kant to deduce the forms and relations of thought from the mere notion of understanding, even when coupled with the principles of formal consistency and consequence. Assuming that understanding is the discursive faculty, the faculty of cognising the many particulars through the one concept or notion, Kant deals first with concepts (Begriffe) as general or discursive representations. He is careful to avoid an error into which many of his followers have fallen, that of regarding Begriffe in a mechanical fashion as a specific kind of Vorstellungen, distinguished only by con-

[1] Two at least of the followers of Kant have worked out the system of logic from this point of view—the one, Twesten, in his *Logik, insbesondere die Analytik* (1825), the other, Mansel, in his *Prolegomena Logica*. Mansel recognising the distinction between the two modes of determining formal logic, adopts the second, and is therefore led, in consistency, to define logic, not as the science of he laws and forms of thought, but as the science treating of formal thought, or of the formal element in the forms of thought. In other words, he recognises that the statement of the forms of thought must be introduced into logic *ab extra*, from psychology or what not, and that logic, accepting these, has to consider the formal element (non-contradictoriness) in them. It is well to have the doctrine brought thus to its ultimate issue, for it is thence apparent that there is no independent science called logic, but simply one comprehensive precept, which may be called logical—viz., avoid contradictoriness in thought. Illustrations of the ways in which contradictoriness manifests itself may be offered, and a useful logical praxis may thus be afforded, but these do not make up a science or theory.

taining a few of the marks making up the single intuitions. He rightly notes that cognition proceeds by subsuming the particulars under the common element contained in them, and that the generality of the concept thus rests upon the relation in which it stands, as reflective ground of cognition, to the particulars. The characteristics of concepts, as possessing extent and content, are treated briefly, after the fashion familiar in the more detailed logics of his school.

It is, however, when the doctrine of judgment is reached that the difficulties of his position appear with greatest distinctness. Judgment is defined "as the representation of unity in the consciousness of distinct representations, or the representation of the relation of these, in so far as they make up a concept."[1] But the essential element in the definition — the unity of consciousness or unification of differences in a notion—is thus left so vague and undetermined that it is impossible to deduce from it any classification or any peculiarities of judgments, and possible indeed to proceed on two quite distinct lines of research. The expression, indeed, refers to that which is the fundamental fact in the critical system, the existence of conditions under which only it is possible for detached data of experience to become objects of knowledge for the single conscious subject; and, had Kant been true to the principles of his system, it would then have been necessary to base any classification and treatment of judgment on the enumeration of the functions of unity in conscious experience. In the *Kritik*[2] emphasis is laid upon the function of unity as the essence of the judgment, but it is a well-known historic fact that Kant makes no attempt to justify in its details the enumeration of such functions on which his divisions rest.

[1] *Logik*, § 17.

[2] *Analytik*, § 19.

His followers in the field of logic,[1] misconceiving the real relation of form to matter, interpreted the unity involved in the judgment as being a merely quantitative relation between given notions.[2] There is here involved a twofold error, which has exercised a most pernicious influence on the fortunes of logical theory. For, in the first place, so to view judgment is implicitly to proceed from the assumption of notions as given elements of knowledge, the relations of which are to be discovered by comparison or analysis of what is contained in them. The notion as empirically given thus becomes the fundamental fact; all other forms of thought, judgment, and syllogism are regarded as merely the mechanism by which the content of notions is evolved. Such a doctrine puts out of sight the peculiarities of the notion as the product of thought only, inevitably compels a distinction between what we may call the real processes of thinking whereby notions are formed and the elaborative processes by which notions when formed may be treated, and, by regarding notions as simplest data, leads back to the old nominalist doctrine according to which all thinking is but the compounding and separating of simple elements.[3]

[1] See specially the treatment of judgment by Esser (*Logik*, §§ 56 and 61), and Jakob (*Log. u. Met.*, §§ 189, 194, 201, 202), where the division of judgments into categorical, hypothetical, and disjunctive flows from a quite arbitrary and artificial principle.

[2] See Twesten, *Logik*, §§ 51-57, and 61; Hamilton, *Logic*, i. 230 *sq.* It may here be remarked that Hamilton's mode of translating the relative sections of Krug and Esser, his main authorities for the details of the Kantian logic, clearly shows that he did not attach any special significance to the phrase "unity of consciousness." In his view, the unity implied in the judgment A is B was the union of A and B in the notion of a given totality or whole—A being part of B in one aspect, B being part of A in another. This relation of whole and part is quite un-Kantian.

[3] It is by this course that the curious phenomenon of an algebraic

And, in the second place, there is involved in all this the underlying prejudice, which it was the very business of the critical system to destroy, the attempt to treat knowledge, and thought, which is an integral part of knowledge, in a purely mechanical fashion. The Kantian analysis for the first time in the history of philosophy brought into clear light the essential peculiarity of knowledge, the reference of all the manifold details of experience to the unity of the thinking subject. Such reference, and the modes in which it expresses itself, are not to be conceived mechanically, nor can we regard the products of thought, the notion, judgment, and reasoning, in the same fashion in which, with but partial success, we treat, in psychology, the representations or reproductions in idea of actual fact. The essence of thought, the unity in difference of objects known and subject cognising, is that which constitutes in its several modes the peculiarity of notions, judgments, and reasonings. The notion is simply the work of thought, looked at, if the expression be allowed, statically. There is no single psychical product, to be treated by the method of observation which is applied in psychology to sensations and ideas, which can be called the notion. Mental facts, which rightly or wrongly psychology deals with after its mechanical fashion, present themselves in a new aspect when they are regarded as parts, or rather as organic elements, in cognition. If we endeavour to apply the abstracting, isolating method of observation *ab extra* to them, doubtless only mechanical, abstract, and external

or symbolic logic springing from the Kantian groundwork has come about. The same result follows, indeed, from any view of thought as merely exercised *about* facts which are already in themselves completed cognitions. Whether we call these notions (with Hamilton) or πρῶτα (with Antisthenes) or elementary data (with Leibniz) or simple apprehensions (with the nominalists), the result is the same.

relations will manifest themselves as obtaining among them, and there may thus be deduced a mass of abstract formulæ expressing relations of agreement and disagreement, total or partial coincidence, confliction, intersection, or coexistence and sequence, which have abstract truth, but are in no way adequate to express the genuine nature of thought.

Kant himself proceeds, as was said, by simply assuming, as somehow given, the cardinal forms of unity in consciousness, and, distinguishing form of judgment from matter by the apparently simple difference between matters united and forms of uniting, draws out the types of judgment under the familiar rubrics of quality, quantity, relation, and modality. The same assumption of distinctions only to be given by the higher researches of transcendental logic is manifested in his treatment of reasoning, the deduction of one judgment from others. Three main types of such deduction are signalised: (1) deductions of the understanding, in which the conclusion follows simply from change in the form of the given judgment; (2) deductions of reason, in which the necessity of the deduced proposition is shown by reference to a general rule under which it falls; (3) deductions of judgment, in which the conclusion is reached by the treatment of given experience in reference to a general rule of reflection upon experience. Under the first of these fall the familiar forms of immediate inference; under the second, syllogism in its three varieties, categorical, hypothetical, and disjunctive; under the third, inductive and analogical reasoning.[1]

[1] There is much interesting matter in the details of the brief sections in which reasoning is handled, as, *e.g.*, the treatment of the syllogistic figures and of the fourth figure in particular, the parallel between induction and analogy, and the reference of both to the abstract formula of the fundamental assumption regarding intelligibility of nature; and it is important to note that Kant lends no counte-

The understanding, if one may interpret Kant freely, is the process by which the worth of what is given is fixed and determined; it moves not beyond the given fact, and can therefore subject the fact to no other than formal transformation. The determining judgment or reason is the expression of the fundamental fact in knowledge that all experience is subject to general rules or conditions; there must therefore be a determination of the particular by the general; there must be ground for subsuming the particular and the universal. The forms of such subsumption and determination of the particular by the general are syllogisms. Syllogism therefore is the mode in which the essence of cognition is made explicit. The reflective judgment is the expression of the tendency to treat the contingent details of this or that given experience after the analogy of the general rule that all experience is subject to intellectual determinations. This analogy does not necessitate the specific determination of the particular by any specific universal, but serves as general directrix in experiential researches. It is sufficiently evident that a remodelling of the older logical doctrine such as this rests upon a wider and more comprehensive philosophical view of knowledge as a whole, that such distinctions cannot flow from either of the principles previously indicated as those on which the formal conception of logic rested, and, finally, that the logical aspect of these distinctions is formal in the only true sense of that

nance to the opposition of syllogism and induction as respectively reasoning from whole to parts and from parts to whole. But the special peculiarities of his logical method are throughout those of the *Kritik*, to which reference is implicit in all that is said, and the results sufficiently show the total impossibility of successfully dealing with reasoning from the so-called independent point of view of formal logic.

word—viz., in that the treatment is of necessity general, applicable to all or any thinking.

31. As in the Kantian system there were placed, side by side, two diverse conceptions of logical system, that of transcendental logic, and that of formal logic, without any adequate link of connection between them, so from the Kantian position there diverged two quite distinct schools of logic, the transcendental or metaphysical, and the formal. As regards the second of these, but little requires to be said. The great body of logical treatises written from the Kantian formal point of view contain nothing of interest. In them the traditional logic is handled under the rubrics supplied by the Kantian general philosophy, with more or less of purifications from needless detail, according to the acuteness or insight of the writers, with more or less of deviation from the Kantian lines. In but few cases did the real difficulty, that of assigning to formal logic an independent plan and method, lead to a radically fresh treatment.[1]

The Kantian transcendental logic, being an analysis of the conditions under which objectivity in general becomes possible material for cognition, is in a special sense a new

[1] Generally, the formal logician is compelled simply to take the processes of thought as determined in psychology or metaphysics or what not, and to consider certain aspects of them. His science has, therefore, no independent place, and no method of development. Independence may be striven after, either by attempting to develop all processes of thought and their logical peculiarities from an initial definition of thought solely, or by combining with this definition the view that non-contradictoriness is the one logical quality, and thus assigning to logic the discussion of the conditions of non-contradiction in thought. Of the first, Hamilton may be taken as the type; of the second, Twesten, Mansel, and Spalding.

theory of thought. For thought is the process mediating the unity of the ego and the multifarious detail of actual experience; and only through thought, the universal, are objects so determined that they are possible matters of knowledge for a conscious subject. As determinations of objects, the pure elements of thought may be called notions, while the realisation of notions in conscious experience is the judgment, wherein the universal of thought and the particular of sense are synthetically united, and the systemisation of experience is the syllogism. Notion, judgment, and syllogism are thus, in the transcendental logic, no bare, abstract forms, but have as their content the pure determinations of objectivity in general. They cannot be conceived mechanically, as mere products differing only in degree of generality and abstractness from the ideas and connections of association which appear as due merely to the psychological mechanism of the human consciousness. They are the essential forms of the ultimate synthesis through which knowledge becomes possible, and thus express in their organic system the very nature of thought, *i.e.*, of the thinking subject.

In the Kantian doctrine, however, as it developed itself historically, there are various points of view which disturb the harmony of the system as thus sketched. Two in particular require special notice, as from these the later attempts at a complete revision of logical theory have taken their origin. (1) Throughout the Kantian work there appears a constant tendency to regard the ego, or central unity of self-consciousness, as merely abstract, as related mechanically, not organically, to the complex of experience in which its inner nature is unfolded. This tendency finds expression in various ways. Thus the synthesis, which has been shown to be the essential feature of cognition, is

regarded as on its subjective side a union of intellectual function and receptivity of sense, and the contributions from either side are viewed as somehow complete in themselves. Knowledge, in accordance with this, might be considered to be the mechanical result of the combination or coherence of the two, a combination which in the last resort must appear to the conscious subject as contingent or accidental. (2) Knowledge, the systematic union of universal and particular in experience, is thought as containing in some obscure fashion a reference to the most real world, the realm of things in themselves, and therefore as being, in antithesis thereto, strictly subjective. The processes of thought, by which unity is given to experience, thus manifest themselves as limited in scope, and as being the very ground or reason of the restriction of knowledge to phenomenal in opposition to noumenal reality.[1]

The presence of these two difficulties or perplexities in the Kantian system, which are, indeed, at bottom but one, led to revision of transcendental logic in two directions. The one line proceeded from the analysis of knowledge as the product of intellectual function and receptivity, and, uniting therewith metaphysical conceptions of varied kinds, culminated in a doctrine of cognition which, retaining the distinction between real and ideal as ultimate, endeavoured to show that the forms of the ideal, *i.e.*, of thought, and the forms of reality were parallel. Logic, under this new conception, appeared as a comprehensive theory of knowledge, the systematic treatment

[1] It is unnecessary to consider what exactly was Kant's teaching on either of these points, or what the significance of the relative doctrine may be in his system. It is sufficient, for the historical purpose in hand, to indicate the apparent tendency of his work, for from this the later developments take their rise.

of the modes in which thought, conditioned by its own nature and by the nature of the reality upon which it is exercised, develops into knowledge, *i.e.*, of the modes in which a representation of things characterised by universality and evidential force is obtained. On the whole this is the position assigned to logic by Schleiermacher, whose view is followed in essentials, though with many variations in detail, by a large and important school of logical writers.[1]

The second direction may be characterised generally as the attempt to develop fully what is involved in Kant's conception of thought as the essential factor of cognition. Any opposition between metaphysic as dealing with the real and logic as dealing with the ideal element in knowledge appears, in this view, as a mere effort of false abstraction. The very nature of reality is its nature in and for thought. The system of pure determinations of objectivity, which Kant had imperfectly sketched, is not to be regarded as a piece of subjective machinery, because it expresses the inmost conditions of intelligence as such. Nothing is more real than the ego, than intelligence or thought. Transcendental logic, or logic which is at the same time metaphysic, is the only discipline to which the title logic by right belongs. For it contains the complete system of the forms in and through which intelligence is realised. The notion, judgment, and syllogism are doubtless forms of thought, but they have their definite content. They are the modes in which the forms of objectivity are realised for intelligence, and are thus at once abstract and concrete. The so-called formal logic

[1] See, for an enumeration of the more prominent members, Ueberweg's *Logik*, § 34, a work which itself is an admirable exposition from the same point of view.

is a mere *caput mortuum*, a descriptive study of some few types of the application of thought to matters of experience. On the whole this is the view of logic developed through Fichte (and in part Schelling) by Hegel, and the Hegelian system shall here be regarded as its complete and only representative.

VIII

LOGIC AS THEORY OF KNOWLEDGE

32. The position assigned to logic as theory of knowledge and the range of problems included in it are determined by the general philosophic view of the distinction between the reality to be apprehended by thought and the subjective nature of thought itself. There may be, therefore, numberless variations in the mode of treating logic with general adherence to the one point of view.[1]

In the *Dialektik* of Schleiermacher, for example, the fundamental characteristic is the attempt to unite some portions of the Kantian analysis of cognition with Spinozistic metaphysic. Knowledge is regarded as the complex combination of intellect, the formative, unifying, idealising faculty, and organisation or receptivity of sense. The generality or common validity of cognition rests on the uniform nature of organisation and on the identity of all ideas in the one ideal system. The objective worth of cognition is referred on the one hand to the determined

[1] It appears an historic error to identify the point of view here referred to with the Aristotelian. The notion of a parallelism between the forms of reality and the forms of knowledge is too definite to be covered by the mere expression, whether in Aristotle or in Plato, of the doctrine that knowledge is knowledge of being.

connection between the real universe and the organisation through which the individual is part of the real order of things, on the other hand to the ultimate metaphysical parallelism between the system of ideas and reality. The primary forms of knowledge, notion, and judgment, distinct from one another only as being knowledge viewed now as stable now as in process, correspond to the ultimate elements of the real, the permanent force or substance and its variable manifestations. Syllogism and induction, with the subordinate processes of definition and division, analysis and synthesis, are technical modes of the development of notions and judgments, modes by which inchoate notions are rendered definite, by which incomplete judgments are rendered complete.[1]

That there is much valuable and suggestive material in this mode of regarding logic is undoubted, and in the discussion of isolated forms of knowledge, such as judgment, it is always desirable that there should be kept in mind the reference to the ultimate character of objectivity. But the whole point of view seems imperfect and open to such objections as will always present themselves when a principle is not carried out to its full extent. It may, for propædeutic purposes, be desirable to separate the handling of logical forms from metaphysic, but such separation cannot be ultimate. The system of forms of reality to

[1] Perhaps the most complete treatment of logic from this point of view is that of George, *Logik als Wissenschaftslehre*, 1868. Ueberweg, dissenting from Schleiermacher's view of syllogism and the systematic processes of reasoning, lays out more fully what in his view are the aspects of reality corresponding to the typical forms of knowledge. Trendelenburg endeavours to fill up the gap between real and ideal by emphasising the community of character between motion, as the ultimate reality, and constructiveness in knowledge, the central activity of the ideal.

which the forms of knowledge are assumed to correspond must in some way enter into knowledge, and they cannot enter in as an absolutely foreign ingredient, to which knowledge has simply to conform itself. For, if so, these metaphysical categories would be discoverable only by an analysis of concrete knowledge, and they would remain as inferences from the nature of cognition, not as data directly known. The cardinal difficulty which appears in all treatments of logic from this point of view is that of explaining how there comes to be known an objective system of things with characteristic forms or aspects, and it is not hard to see that the acceptance of a reality so formed is but a relic of the pernicious abstraction which gave rise to the Kantian severance of knowledge from noumenal reality.[1] In short, the position taken by Schleiermacher and his school, as final standing ground, is but an intermediate stage in the development of that which lay implicit in the critical philosophy.

Moreover, it is hardly possible to assume this point of view without tending to fall back into that mechanical view of knowledge from which Kant had endeavoured to free philosophy. If there be assumed the severance between real and ideal, it is hardly possible to avoid deduction of all that is characteristic of the ideal order

[1] Thus we find in Schleiermacher (*Dial.*, §§ 132-34) that the ultimate difference of ideal and real is accepted as simple datum. In Ueberweg (*Logik*, § 8 and *passim*) there is continuous reference to an inner order of things, the forms of which are the metaphysical categories; but the actual treatment is altogether independent of these forms; and we may conjecture that, in the last resort, Ueberweg would have explained the characteristics of logical thinking by reference rather to the psychological mechanism than to a supposed nature of things (see *Logik*, §§ 40-42), and thus approximated to the position of Beneke rather than to that of Schleiermacher.

from the observed or conjectured psychological peculiarities of inner experience. The real appears only as ultimate point of reference, but in no other way determines the form of knowledge. The characteristic relations which give content to notions, judgments, and syllogisms are deduced psychologically.[1] In the long run, it would no doubt be found that the real key to the position is the belief, more or less expressed, that the systematic view of thought as comprehending and evolving the forms of reality is an unattainable ideal—that metaphysic, to put it briefly, is impossible.

To some extent this is the position taken by Lotze, whose cautious and ever thoughtful expositions are invariably directed to the elucidation of the real *nodi*, the real roots of perplexity or incompleteness of doctrine. In his view logical forms are the modes in which thought works up the material, supplied in inner experience by the psychological mechanism of the soul, in conformity to the ultimate presuppositions with the aid of which alone can harmony, or ethical and æsthetic completeness, be gained for our conceptions of things. But with this doctrine, which approaches more clearly than any other of the type to the metaphysical logic, there is coupled the reserve that any actual point of view from which the development of these presuppositions, their rational explanation, might become possible is unattainable. Our confidence in them

[1] This tendency, which appears in Schleiermacher and Ueberweg, and indeed in all the logics of that school (George's *Logik*, *e.g.*, is hardly to be distinguished from psychology), is prominent in Beneke. It is curious to note a precisely similar result in the logical theory of Herbert Spencer. Spencer supposes himself to be throughout referring to the nature of reality, but in fact all that is specific in the forms of reasoning developed by him is of psychological origin (see *Pr. of Psych.*, ii. §§ 302-9).

is finally of an ethical character, and depends upon our conviction of the ethical end or purpose of all the surroundings within which human life and character is manifested. In logic as in metaphysic we must content ourselves with more or less fragmentary treatment.[1]

[1] Lotze's whole view of the genetic connection of the forms of thought is peculiar to himself, and deserves separate treatment (see below, p. 194 *sq.*).

IX

LOGIC AS METAPHYSICAL

33. The peculiarities of this, the final conception of logic, are not to be deduced from the simple statement that in it no distinction is drawn between logic and metaphysic.[1] There must be understood the ultimate view of knowledge as that in which thought and reality are united, and of philosophy generally as the attempt to develop the whole system of these abstract determinations of thought by which coherence and intelligibility are given to knowledge. In it there is carried out to the full extent Kant's idea of thought as the ultimate germ of intelligibility.

In the critical system, as we have seen, the fundamental idea was continuously disturbed by the intrusion of doctrines which possessed significance only when the problems were treated from a quite opposed point of view. Thus the abstract separation of conscious experience, regulated according to the conditions of the unity of thought, from a supposed realm of reality involved the consideration of the subject as one portion or item of a mechanical whole. In other words, the Kantian system proved itself unable to unite in a comprehensive fashion

[1] For there is no such definite understanding as to what these mean as would make the statement of their identification helpful.

the two ideas of thought as the universal in experience and of thought as the activity or mode of realisation of the individual subject. The central point of view, that which refers all in experience to the unity of thought, was continuously departed from, and as a natural consequence the various forms or modes of thought were treated, not in relation to their ultimate unity, but as isolated facts, to be dealt with by principles resting on a totally opposed doctrine. It is the essence of the Hegelian method to keep continuously in view the concrete unity and totality of thought, to treat each special aspect or determination as an integral portion of an organic whole, a portion which must prove itself unintelligible and contradictory if regarded apart from its relations to the whole, and so to avoid those mechanical separations and abstractions which had proved fatal to the Kantian doctrine.

In the development of a method which rests upon and endeavours to retain so comprehensive a point of view, there must of necessity be much that is tentative and imperfect. Differences of opinion regarding the main stages in the development, regarding the particular content of any one stage, are quite compatible with adhesion to the general principle of the whole.[1] But from this point of view only can justice be done to those forms of thought which have always been regarded as the special material of logical treatment; from any other, the treatment must be partial, fragmentary, and, so to speak, external. Thus, notion, judgment, and syllogism are not, in this view,

[1] Hegel himself fully recognises the tentative character of the numerous divisions and classification of the categories of thought which make up the substance of the *Logik*, and desires that too much stress be not laid on the formal side of his exposition (see *Logik*, i. 29).

treated as merely subjective modes in which the individual consciousness apprehends and works up the material of experience, but as higher, more developed, and therefore richer forms of the determinations of thought in and through which intelligibility of experience is acquired. The whole system of these determinations of thought, the categories, is the matter of logic ; the realisation of them in subjective experience, or the treatment of the successive phases of consciousness in which abstract thought comes to be recognised in and by the individual, is the matter of the philosophy of spirit, of which psychology is one portion. Doubtless the logical treatment may be led up to by tracing the modes in which the full consciousness of the determinations of thought as the essence of reality is attained, but such introduction is propædeutic merely ; and within the logical system itself the starting-point must be the simplest, least definite of those categories whereby for spirit the realm of fact becomes intelligible.

The nature of the opposition between this view and that of the ordinary logic, which in the main rests upon the principle of individualist psychology, that the content of knowledge is derived *ab extra*, from an entirely foreign world of fact, will become more clear if there be considered specially the treatment which under the two methods is given to the notion. Notions, in ordinary logic, are regarded as products formed from the data supplied by presentative and representative experience, and the mode of formation as generally conceived is a continuous process of critical comparison, recognition of differences, similarities, and grouping of like facts. Not only then does the notion present itself as relatively poor and meagre in content, a kind of attenuated individual, not only are the only

characteristics presented to the operation of thought mechanical and external, but the final product appears as a mere subjective abbreviation of what is given in experience.

In the process, however, even as it is ordinarily conceived, there is more involved than is apparent on the surface. The individuals subjected to the abstracting and generalising activity of thought are *qualified* individuals, *i.e.*, individuals viewed as determined in their own nature and in respect of thought by a whole network of relations, which when stated abstractly are really of the nature of categories. They are individuals only for a unifying intelligence which views them under diverse aspects, and these aspects are the blank forms of intelligibility, which it is the very function of logic to consider in system. Moreover, the purely formal acceptation of the notion as a mere mental hieroglyphic or sign stands in sharp contradiction to the view which as a rule accompanies it, and which, for the most part, receives explicit statement in a so-called applied logic or doctrine of method, that in the notion is contained the representation of the essence or truth of reality. It is impossible to retain with any consistency the merely arithmetical or numerical doctrine of the notion, as containing fewer marks than the individual, of the genus as characterised by a less number of attributes than the species, and so on. Underlying all genuine knowledge, all classification, and therefore all formation of notions, is the tendency towards the subordination of parts to a law which determines them. The generic attributes are not simply the points of agreement, but the determining characteristics, and the notion of a thing is the explicit recognition of its nature as a particular manifestation of a universal law.

Thus, even within the limits of the ordinary logic, there are problems which force upon it the reconsideration of the view which regards the notion as merely a mechanically formed psychical fact. Knowledge, no doubt, is only realised subjectively in and through psychical facts; but the treatment of it in its nature as knowledge, and the treatment of its psychical aspect, are *toto genere* distinct. The metaphysical doctrine which keeps consistently in view thought as the essence of knowledge in its own nature has therefore to contemplate the notion in strictest relation to thought, as one mode in which objectivity as such is apprehended, made intelligible, and, in a very special sense, as the mode in which the nature of thought is made explicit. Thus the notion can only appear as uniting and comprehending under a new aspect those intellectual determinations whereby things are related to one another in a cognisable system.

The special characteristic of the Hegelian logic, the methodical principle of development of the determinations of thought, requires for its full elucidation a longer treatment than is compatible with the scope of a general sketch. But it seems necessary to add a word respecting certain difficulties or objections which apply, not specially to the methodical principle of Hegel's logic, but generally to the idea of a logic which is at the same time metaphysic or a treatment of ultimate notions. These objections may be variously put, according to the special point of view assumed by the critic, but they are in the long run dependent on one mode of interpretation of the fundamental antithesis between being, or reality, and thought. For, whether we say that it is confusion to identify thought-forms with relations of fact, that it is unphilosophical to assume that being of necessity conforms to thought, that thought

is purely subjective and knowledge the system of forms in and through which the subjective is brought after its own nature to an adequate representation of objective fact, or point to phenomena of perception as showing that even adequate correspondence, not to speak of identity, between subjective and objective must be matter of discussion, or lay stress upon the procedure of science as negativing the preliminary assumption of the logico-metaphysical assumption, we but express in varied ways a fundamental interpretation of the opposition between reality and knowledge. We assume an initial distinction, the grounds and precise nature of which are never made clear. For the antithesis between thought and reality is an antithesis in and by means of conscious experience, and is not to be comprehended save through conscious experience. If, indeed, we start with conscious experience as a mechanically formed *tertium quid*, something which arises out of the correlation of an unknown subject and an unknown object, we may certainly retain, as an ever-recurring and insoluble problem, the possibility of cognising either factor *per se*.

But the problem arises not from the antithesis but from our way of reading or interpreting it. Opposition between subjective thinking and the real world of fact, slow, tentative, and imperfect development in individual consciousness of knowledge which contains in essential relation the opposed elements, distinction therefore of the metaphysical or real categories which determine the nature of objects as knowable from the ideal or logical categories which express more specifically the fashion in which the knowable object is reduced to the subjective form of cognition, are not only perfectly compatible with, but are strictly reasoned conclusions from, the ultimate doctrine that in thought alone

is to be found the secret both of knowing and of being. To bring against this doctrine the continuous complaint that it assumes an identity which, if it can be proved at all, at least demands proof, is to misunderstand the very notion of identity which plays so important a part in the objection. Not even in the most judicious and thoughtful critics of metaphysical logic, in Lotze for example,[1] does one find a sufficiently careful distinction between a mere question of nomenclature (*i.e.*, whether we shall restrict the title *logic* to the portion of general system which deals with notions, judgments, and syllogism, while reserving for metaphysics all the other inquiries) and the question of theoretical importance, whether there remains, over and above the difference between the more immediate determinations of thought and its more complex or reflective modes, an essential difference in knowledge between thought and reality. In less careful critics the oversight simply leads to the contention that we shall always repeat the problem of knowing and being as insoluble, and shall view knowledge as a mechanical, subjective product.

Many of these objections doubtless result from a very simple fact, already more than once alluded to. Particular distinctions, apparently the most elementary, frequently involve and are unintelligible apart from a developed, though not necessarily consistent or well-grounded, conception of things in general. Thus the emphasis laid upon thought as essentially subjective, as being merely the system of operations whereby the individual brings into order and coherence in his own experience what is furnished *ab extra* through the natural connection in which he is placed to the objective world,

[1] See his *Logik* (1843), pp. 10, 11, and *Logik* (1874), bk. iii., chaps. 4, 5.

seems at first sight the most simple and direct consequence of the actually given distinction between the individual as one natural unit and the sum of things comprehending him and all others. But, on analysing more closely the title for applying to philosophical problems a view which is that of practical life, and doubtless legitimate and necessary within that sphere, we readily become aware of a whole series of speculative assumptions implicit in that view, and possibly without any adequate justification. At all events, whether or not the view be ultimately defensible, and in the same form in which it is at first assumed, it is unphilosophical to start in the treatment of a difficult and important discussion from principles so ambiguous and undetermined. The practical difference between the individual agent and the external sphere within which his individual operations are realised and which is therefore treated by him, from his point of view, as external, throws no light *per se* on the nature of the ultimate relation between the individual thinker as such and the world within which his thought is exercised. The confusion between ultimate distinctions and practical points of view is productive of most pernicious consequences not only in logic specially but in philosophy at large.

X

CRITICISM OF THE CHIEF LOGICAL SCHOOLS

34. It will probably be now apparent that determination of the nature, province, and method of logic is, and has always been, dependent on the conception formed as to the nature of knowledge. Discussions regarding the precise definition of logic are not mere analytical disputes regarding the best mode of expressing in terms the nature of a subject sufficiently agreed upon; variations in the treatment of particular portions of logical discipline do not arise from more or less accurate discrimination of the nature and relations of given material; nor are differences in respect to the amount of logical matter to be considered mere expressions of difference as to the range of the same fundamental principles. The grounds for divergence are much more deeply seated; and, looking back upon the historical survey of the main conceptions of logical science, it seems quite impossible to hope that by comparison and selection certain common points of view or methods may be extracted, to which the title of logical might beyond dispute be applied. It results, moreover, from this fact that criticism of various logical views cannot be conducted by the method of bringing each in turn before a recognised rule or established opinion respecting the contents and methods of logical science.

The logic, as one may call it, of each philosophical theory of knowledge is an integral part or necessary consequence of such theory; and its validity, whether in whole or in part, depends upon the completeness and coherence of the explanation of knowledge in general which forms the essence of that theory.

The course of the preceding historical survey has brought before us a variety of conceptions of logic resting on various doctrines of knowledge; and, had it been possible to include in these historic notes references to the several treatments of details—such as classification of notions, analysis of judgments, system of reasoning, and methods of proof—an equal variety in special points would have been apparent. Any criticism of a general conception of logic or special application thereof, which does not rest upon criticism of the theory of knowledge implied in it, must be inept and useless.

It is not possible to include such expanded criticism in the present work. There remains therefore only one aspect of these various logical schemes which may be subjected to special and isolated examination, viz., the inner coherence of each scheme as presented by its author. Naturally such an examination can be applied only to views which imply the separate existence of logic as a body of doctrine developing into system from its own peculiar principles. When it is a fundamental position that logic as such has no separate existence, but is one with the all-comprehensive doctrine or theory of the ultimate nature of cognition, it is not possible to criticise such conception of logic separately; criticism of logic then becomes criticism of the whole philosophical system. In most of the views brought before us, however, a special place has been assigned to logic; it has been placed in various relations

to the allied subjects of psychology and metaphysics, but with a certain independence; and its contents have been assumed to follow in some way from its own special principles. It is therefore possible to apply internal criticism to the more important of these general views, and to consider how far the pretensions of logic to an independent position and method are substantiated.

From the foregoing remarks it will also have become apparent that a general classification of logical schools, as opposed to the reference of these to ultimate distinctions of philosophical theory, is impossible. A distribution into formal (subjective), real (empirical, or, as German authorities designate it, *erkenntnisstheoretisch*), and metaphysical conceptions of logic is rather confusing than helpful. For the formal logics of the Kantian writers, of Hamilton, and of Mansel are distinct, not only from one another, but from such equally formal logics as those of Hobbes, Condillac, Leibniz, Herbart, Ulrici, Boole, De Morgan, and Jevons. Logic as theory of knowledge presents quite special features when handled by Mill, or by Schleiermacher, Ueberweg, Beneke, and Wundt. And it cannot even be admitted that the threefold classification affords room, without violence, for the Aristotelian logical researches. There are no points of agreement and difference so unambiguous that by their aid a division can be effected.[1]

35. Few conceptions of logic contain, with so little real ground, such professions of completeness and independence

[1] Nor are more detailed classifications, such as those of Rosenkranz (*Die Modificationen der Logik*, 1842), Prantl (*Die Bedeutung der Logik*, 1849), Rabus (*Neueste Bestrebungen*, 1880), of service, except when historical.

as that developed in the writings of the Kantian school.[1] According to this view, logic is a pure science, having as its special material the form of thought, demonstrative in character and with theorems capable of complete deduction from the elementary principles contained in the very notion of form as opposed to matter of thought. But, when one comes to the examination of the system itself, one finds (*a*) that the notions of form and matter are much too stubborn to lend themselves readily to analysis, and that explanations of what exactly constitutes form fluctuate between a merely negative definition (whatever is not treated in any other science, philosophical or otherwise) and a psychological deduction from the assumed nature of thought;[2] (*b*) that the really important factor in determining the contents of logical science is psychology, from which much more is borrowed than the mere preliminary definition of thought; (*c*) that demonstrative character rests entirely on an abstract interpretation of the laws of identity and non-contradiction; (*d*) that throughout the whole system there is not a trace of development, but merely the reiterated application of the law of identity and contradiction, or of some confused distinction between form and matter, to logical products—the notion, judgment, and syllogism—whose nature, characteristics, and distribution are arbitrarily accepted from psychology or general criticism or what not.

Thus, in the majority of cases, logicians who simply followed the lines indicated by Kant introduced into their

[1] Under this head Kant himself, for reasons above given, is not included; the writers referred to are named in Ueberweg (*Logik*, § 34).

[2] Mill's criticism on Hamilton's confused statements regarding forms (*Exam. of Hamilton*, 438-454), is perfectly applicable to the generality of the Kantian treatises on logic.

system, without any criticism, the fundamental distinctions contained in the *Kritik der reinen Vernunft*. The fourfold scheme of quantity, quality, relation, and modality was applied without hesitation, though in varied and always artificial fashion, to notions;[1] judgments were accepted as being categorical, hypothetical, and disjunctive in kind, though the differences are altogether foreign to the logical principles applied; and generally no attempt was made to do more than treat, in an abstract fashion, some aspects of a procedure of thought determined in all its phases by extra-logical considerations. The inevitable result of such a treatment was the undue preponderance given to the doctrine of notions, which, being viewed after the fashion of Kant as given, completed products, appeared as the ultimate units of thought, to be combined, separated, and grouped together in all the higher processes.

The peculiarities of the logical system which is commonly associated with the name of Sir W. Hamilton spring entirely from this view of notions. For, if notions be regarded as the elements of thought, then the judgment which elaborates them can only present itself as the explicit statement of immediate relations discernible among notions. These immediate relations reduce themselves, for Hamilton, to one—the quantitative relation of whole and part—and, attention being concentrated on the extensive reference of concepts, the eightfold scheme of propositional forms is the natural consequence. To such a scheme the objections are manifold. It is neither coherent in itself, nor expressive of the nature of thinking, nor deduced truly from the general principle of the Hamiltonian logic. For it ought to have been kept in mind that extension is but an aspect of the notion, not a separable fact upon which the logical

[1] See, *e.g.*, Krug, *Logik*, § 25 *sq.*

processes of elaboration are to be directed. It is, moreover, sufficiently clear that the relation of whole and part is far from exhausting or even adequately representing the relations in which things become for intelligence matters of cognition; and it is further evident that the procedure by which types of judgment are distinguished according to the total or partial reference to extension contained in them assumes a stage and amount of knowledge which is really the completed result of cognition, not that with which it starts or by which it proceeds.[1]

The utility of basing logical theorems on psychological premisses, a method involved in the procedure of most expositions of formal logic, may well be matter of doubt. For psychology, as ordinarily conceived, has certainly close relations with logic, but in aim and in point of view is distinctly opposed or at all events subordinate to it. The psychological investigation of thought, if carried out consistently, must take one of two forms: either that of description, in which thought, like any other mental fact, is regarded *ab extra* as that upon which attention and observation are to be directed,—in which case therefore any relations of thoughts among themselves must be of such an external nature as can be presented in the field of observation; or that of genesis, development, in which the

[1] The extension of a notion has no numerical or quantitative definiteness. To formulate the judgment as expressing definite amounts of extension, therefore, presupposes complete empirical survey of what, by its very essence, remains incomplete. This is specially noteworthy in the case of Hamilton's particular judgments. A judgment such as *only some A is all B* assumes total and perfect knowledge of the whole spheres of A and B. It is in the strictest sense of the word *universal*. Hamilton, it may be added, finds it completely impossible to work out a coherent doctrine of syllogism from the point of view taken in the treatment of the judgment.

subjective processes of mind are viewed as forms of the one great process whereby knowledge is realised in the individual consciousness. Investigations from the first point of view are diametrically opposed to the logical treatment of thought; for in the latter the essential feature, the reference in the subject, with his mental forms, to an objective order within his experience, is entirely wanting. Such investigation is abstract; it proceeds upon and remains within the limits of a distinction drawn in and for conscious experience, a distinction the grounds, significance, and modes of which require to be treated by a larger and more comprehensive method. Investigations from the second point of view are subordinate to logic in the wider sense; for the treatment of the subjective processes therein is illuminated and determined by the general principles regarding the nature and meaning of conscious experience which it is the sole function of logic to bring forward and establish. The psychology which Hamilton generally has in view is that commonly called empirical, and with his conception of it the two sciences, logic and psychology, are really one.

36. A possible exit from the difficulties or assumptions of the current Kantian logic may be sought by following out and consistently applying the hint contained in Kant's distinction of analytic and synthetic thought, analytic and synthetic truth. It may be said that all thinking involves the fundamental laws of identity and non-contradiction; that in these laws only is to be found the characteristic and most general feature of thought; that in them only is the form, or element contributed by mind itself, to be detected. Logic would thus be regarded as the explicit statement of the conditions of non-contradictoriness in thought, as the

evolution of the formal element in thought, and, since in analytic truth only can non-contradictoriness be discovered without material aid, as the theory of analytic thought. Such is the position assigned to logic by Twesten, Mansel, Spalding, and some others; and the consequences to which it inevitably leads are sufficiently interesting to require that some special examination should be given to it.

In the first place, then, it seems evident that the fundamental distinction implied, that between analytic and synthetic thought, is wrongly conceived. That analysis and synthesis are methods of cognition, differing in many important respects, is undoubted; but such difference lies in a sphere altogether alien to that within which the present distinction is to be sought. Analytic thought, as here conceived, is only to be understood when taken in reference to the judgment, and then also in reference to a peculiarity in the Kantian doctrine. Kant, emphasising the principle that judgment is essentially the form in which the particular of experience is determined by the universal element of thought, but identifying this universal with a formed concept (resembling, therefore, a class notion), contemplated a class of judgments in which the predicate was merely an explication of the subject notion. Such judgments, had the matter been more fully considered, would have appeared as far from primary; and Kant has himself, in the most unambiguous language, indicated the correct view that analysis is consequent and dependent on synthesis — that analytic judgments, therefore, are merely special applications of abstracting thought within a sphere already treated, handled, formed by thought. Mansel, too, whose views are generally acute if not profound, has signalised as the primitive unit of cognition the so-called psychological judgment, which is essentially synthetic in

character. The logical judgment, in fact, about which his conception of logic centres, is recognised as a posterior act of reflection, directed upon formed notions, and is not in any way to be regarded as containing what is a common, universal feature of all judgments.

In the second place, even granting what cannot be maintained, that the process of thought is mere explication of the content of previous knowledge, and that the theory of logic has to do with a comparatively small and subordinate portion of cognition, there is in such a principle no means of development. We may take up in succession class-notions, judgments, reasonings, and in relation to each reiterate, as the one axiom of logic, that the constituent elements shall be non-contradictory; but such a treatment is only possible in relation to a material already formed and organised. The utmost possible value being given to such a view, logic, under it, could be but a partial and inchoate doctrine.

Finally, there is involved in the doctrine of analytic thought, and in the consequences to which attention will next be drawn, a peculiar and one-sided conception of identity or of the principle of identity as an element in thought. Historically this conception has played a most important part: it lies at the root of all nominalist logic from Antisthenes downwards, and has found metaphysical expression of the most diverse kinds. *That things are what they are* is the odd fashion in which a wellnigh forgotten English writer states what is taken to be the universal foundation of all thought and knowledge.[1] The

[1] John Sergeant. See *The Method to Science*, by J. S., 8vo., Lond., 1696, pp. 144, 145. This curious book contains much interesting matter. Sergeant regards inference as "the establishment of identity between extremes by identity with the middle" (p. 227);

representatives of things in our subjective experience, the units of knowledge, may be called notions, and, accordingly, that each notion should be what it is appears as the corresponding logical axiom. The whole process of thought is therefore regarded as merely the explicit statement of what each notion is, and the separation of it by direct or indirect methods from all that it is not. The judgment, essentially the active movement of thought, is reduced to the mere expression of the identity of a notion, and in truth, were the doctrine consistently carried out, Antisthenes's conclusion that the judgment is a fallacious and inept form of thought would be the necessary result. When such a conclusion is not drawn, its place is generally taken by much vague declamation regarding the limited, imperfect, and uncertain character of our knowledge, which is regarded as asymptotically approaching to the adequate determination of truth.

The conception which underlies this view is the abstract separation of thought from things which has been already noted, but the proximate principle is a deduction there-

rejects the second and third figures, and indeed figure at all (p. 233); reduces all modes of inference, hypothetical and others, to one type (p. 247); considers that all truths are identical propositions (p. 267), even the causal relation being of the nature of an identity (pp. 144-5); and concludes with that which is an inevitable consequence of this doctrine, viz., that knowledge of one fact in nature implies knowledge of all nature (p. 269). Much modern criticism of plurality of causes is anticipated here, as indeed it rests on the same abstract conception of identity. If the whole universe be the cause at any one moment, it is perfectly clear that "plurality of causes" is a contradiction in terms; but so, for that matter, would *cause* be under a like condition. The universe is the universe; things are what they are; our thinking is ultimately an incessant reiteration of the same, A, A, A. Sergeant is acute enough to see what many modern critics have not perceived, that the notion of change is endangered by such an abstract principle (see pp. 305-6).

from. Knowledge or thought is treated externally as a series of isolated units or parts, and the results of cognition —notions, judgments, and reasonings—are viewed as the constituent factors. Thus, *e.g.*, when it is said that a judgment is the expression of an identity, there are possible only two modes of explanation: the one, that the identity referred to is that between the original notion (subject) as unqualified by its predicates and the same as qualified, in which case manifestly the result of the judgment is taken as being its constituent essence; the other that the identity is that of the applicability of distinct names to the same fact, in which case we accept without further inquiry and exclude from logical consideration the processes of thought by which the application of names is brought about, and assume as being the procedure of thought itself that which is its consequence. Under all circumstances, difference is as important an element as identity in the judgment, and to concentrate attention upon the identity is to take a one-sided and imperfect view.[1]

37. So soon, however, as the real nature of thought has been thrown out of account as not concerned in the processes of logic, so soon as the law of non-contradiction in its manifold statement has been formulated as the one principle of logical or formal thinking, there appears the possibility of evolving an exact system of the conditions of non-contradictoriness. The ultimate units of knowledge, whatsoever we call them, whether notions or ideas of classes or names, have at least one characteristic: they are what they are, and therefore exclude from themselves

[1] On Condillac's attempt to treat judgments as identities (or equations) some excellent remarks will be found in De Tracy, *Idéologie*, iii. 133-143, *cf.* Duhamel, *Des Méthodes*, i. 89-94.

whatever is contradictory of their nature. They are combined positions and negations, that which is posited or negated being left undetermined,—referred, in fact, to matter as opposed to form. With respect to any article of thought, therefore, the only logical requirement is that it shall possess the characteristic of not being self-contradictory, and the only logical question is, what exactly is posited and negated thereby. Complex articles of thought viewed in like manner as complexes of positions and negations may have the same condition demanded of them and the same question put regarding them. A judgment and a syllogism, if narrowly investigated, will appear to be merely complex articles of thought, complexes of positions and negations.

Proceeding from such a conception there may be treatments more or less systematic and fruitful. In the hands of Kantian logicians, such as Twesten, Mansel, Spalding, and the like, little is effected, for, as the forms of thought are accepted as giving and as having their characteristics otherwise fixed (by psychology or critical theory of knowledge), the treatment resolves itself either into repetition, in respect to each, of the fundamental logical condition, or into the erection of a specific kind of thought (analytical) which has no other feature save that of correspondence with the said condition. But it is clear that restriction by any psychological or critical doctrine of thought is an arbitrary limitation. It is needful only to regard the operation of thought as establishment of positions and negations, and to develop, by whatever method, the systematic results of such a view. Hobbes's doctrine of thought as dealing with names and as essentially addition and subtraction of nameable features, Boole's doctrine of thought as the determination of a class, Jevons's view of thought as simple

apprehension of qualities,— any of these will serve as starting-point, for in all of them the fruitful element is the same. The further step that the generalisation of the system of thought must take a symbolic form presents itself as an immediate and natural consequence.

38. By the application of a symbolic method is not to be understood what has been practised by many writers on logic—the illustration of elementary logical relations by numerical or algebraic signs or by diagrammatic schemata. The expression has the signification which it bears in mathematical analysis, and implies that the general relations of dependence among objects of thought, of whatsoever kind, in correspondence with which operations of perfectly general character are carried out, shall be represented by symbols, the laws of which are determined by the nature of these relations or by the laws of the corresponding operations. The mere use of abbreviations for the objects of treatment is not the application of a symbolic method ;[1] but so soon as the general relations of, or general operations with, these objects are represented by symbols, and the laws of such symbols stated as deductions therefrom, there arises the possibility of a symbolic de-

[1] Thus one would not describe Aristotle's use of letters for the terms of his syllogisms, nor the current logical abbreviations of S, P, and M in like case, as being, in any true sense of the word, symbolic. On the subject generally, the instructive work of Mr Venn (*Symbolic Logic*, 1881) should be consulted. Mr Venn has not only in this work expounded the foundations and main theorems of Boole's logic with a care and skill that leave nothing to be desired, but he has, independently of many real contributions to logical analysis, put in its true light the nature of symbolic method in logic. He has rendered it impossible, even for the outsider, to complain that symbolic logic is an arbitrary application of mathematical method to logical material.

velopment or method of treatment, which may lead to more or less expanded results according as the significance of the symbolic laws is more or less general. Thus quantity, whether discrete or continuous, presents, as an aspect of phenomena, relations of a highly general kind, offers itself as object of operations of a highly general kind, and is therefore peculiarly the subject of symbolic treatment.

Currently, indeed, the treatment of quantity is assumed to have the monopoly of symbolism; but such an assumption is not self-evidently true, and it is permissible to inquire whether matters non-quantitative do not present relations of such generality that they, too, can be symbolically dealt with. It is, however, a further question whether the generality of the relations and therefore the significance of the symbols in such cases, although subject to some special conditions not necessarily involved in the nature of quantity, do not spring from the fact that we treat the matters as quantities of a special kind, and so insensibly find ourselves applying quantitative methods. In other words, it remains to be investigated, after the preliminary definitions and axioms of any symbolic method have been laid down, whether the conception of thought with which we start, or a special feature distinctly quantitative in character, has been the truly fruitful element in after-development of the system.[1]

The first step in any symbolic logic must evidently be the determination of the nature and laws of the symbols; and, as these follow from the nature of the operations of thought, the first step is likewise a statement of the essential characteristic of thinking. As above noted, there have been adopted various modes of expressing this character-

[1] An excellent note on symbolic logic will be found in Lotze, *Logik* (2nd ed., 1880), pp. 256-59, Eng. tr., pp. 208-23.

istic, and in some cases the mode adopted is not one from which any generally applicable symbolic rules of procedure could have followed.[1] Two only require here to be noted, as representing special views: first, that which proceeds from the idea of thought as essentially the process of grouping, classing, determining a definite set of objects by a mark or notion; and second, that which proceeds more generally from the conception of thought as consisting of a series of self-identical units, to be variously combined in obedience to the law of self-identity.[2] Adopting the first view, we find that processes capable of symbolic representation, by the customary algebraic signs of addition, subtraction, equivalence, multiplication, and division, have a perfectly general significance in reference to the combination, separation, equalisation of classes, to the imposition and removal of restriction on a class; that to the symbols there can therefore be assigned a set of general laws; and that any peculiarity of these symbolic laws which differentiates them from the laws of like symbols in mathematical analysis is deducible from the notion of thought with which we started, and is consequently to be carried along with them in all the after development.[3]

[1] Some of these, as *e.g.*, Lambert's and Ploucquet's, are noted and discussed by Mr Venn (*Symbolic Logic*, xxxii.-xxxvi. and *passim*).

[2] The first is the view taken by Boole (and expounded with great fulness in Venn, as above); the second is that of the brothers Grassmann (in the *Formenlehre*, 1872, especially bk. ii., *Die Begriffslehre oder Logik*). I do not specially note Jevons's theory, otherwise one of high interest and leading to many elegant and ingenious processes, for it appears to me, while not absolutely coinciding in statement with that of either Boole or Grassmann, to be covered by what is special to each of them, and to be valuable mainly as a simplification in certain particular directions.

[3] Mr Venn, in his exposition of Boole, has done much to clear up the significance and laws of the symbol for division. I am inclined

Symbolic representation of relations of classes follows with equal directness from the general notion that by any such relation a new group is determined in reference to the original groups, or rather that the position or negation of a new group (or series of groups) is given, definitely or indefinitely, as the result of such a relation.

With the aid of the symbolic laws so reached, the logical problem as such may then be approached. Given any number of logical terms (*i.e.*, classes, or, as it may be better put, positions and negations) connected together by any relations, to determine completely any one in reference to the others, or to express any one in terms of the others. The symbolic procedure, expounded with marvellous ingenuity and success by Boole, may take various forms, and may be simplified by many analytical devices, but consists essentially in determining systematically how given positions and negations, definite or indefinite, combine with or neutralise one another. A more detailed account of these formal processes is beyond our limits.[1]

The first question which suggests itself in connection with Boole's symbolic logic is the necessity or advisability of retaining the reference to classes, or the description of thought as classification. Do the symbolic laws really depend to any extent on the logical peculiarities of class

to think that it would be quite in accordance with Boole's idea to assimilate multiplication and division to the familiar logical processes of determination and abstraction (as indeed is hinted by Mr Venn, *l. c.*, p. 80). For these processes can, from the special point of view, relate only to the subdivision of a class in extension, and have no reference to the usual distinctions of connotation and denotation.

[1] Mr Venn's work is here again invaluable. Jevons's *Principles of Science* and *Studies in Deductive Logic* should be consulted. Schröder's *Operationskreis des Logikkalculs* contains some very elegant and simple methods.

arrangement? Mr Venn, who emphasises this feature in Boole's scheme, has, however, done good service in leading up to a different explanation. The general reference to objects, which is also noted as implied in all Boole's formulæ, has nothing to do with the possible difference of conceptualist or materialist doctrines of the proposition; and, in fact, as all distinctions of thing and quality, resemblance and difference, higher and lower, subject and predicate vanish, or are absorbed in the more general principle underlying the symbolic method, phrases such as classification, extension, intension, and the like should be banished as not pertinent. Nay, the usual distinctions of quantity and even of quality either disappear or acquire a new significance when they are brought under the scope of the new principle. "What symbolic logic works upon by preference is a system of dichotomy, of x and not x, y and not y, and so forth."[1] In other words, quantitative differences require to find expression through some combination of the positions and negations of the elements making up the objects dealt with,[2] while the usual qualitative distinctions are merged in the position or negation of various combinations.

The whole phraseology then of classification and its allied processes seems needless when used to denote the simple determination of objects thought. The literal signs express, not "classes," but units, determined in and for thought as self-identical. For this reason then it appears that the view of the foundations of the symbolic methods of logic taken in Grassmann's *Begriffslehre* is more

[1] Venn, as above, p. 162.

[2] Where this is impossible, as in the case of the truly particular or indeterminate judgment, symbolic methods encounter almost insurmountable difficulties.

thoroughgoing, and more closely represents the underlying principles, than that involved in Boole's formulæ and expounded in detail by Mr Venn.[1]

Grassmann, as above stated, deduces logical relations as a particular class of the determinations necessarily attaching to all quantities (*i.e.*, determined contents of thought). Abstraction being made of all peculiarities which may be due to their special constitution, quantities exhibit certain formal relations when they are combined (added, subtracted, &c.). Each quantity is a unity of thought, a definite *positum*, and of such units there are but two classes, elements and complexes. Units of thought, which are self-identical, and therefore subject to the specific law

[1] For this reason we think that Mr Venn's criticism of the intensive reading of logical terms is somewhat beside the mark. Beyond a question, if the point of view from which intension has any significance and importance be adopted, the relations of notions in intension would be impracticable for symbolic handling; but from this point of view no such separation between extension and intension as Mr Venn contemplates is possible. The objects with which symbolic logic can deal, and the relations of which it can take into account, are determined units, in respect to which difference between their qualities as recognised and things possessing them is inept. *A* for symbolic logic, is simply a definite position, with the function of excluding not-A, and the capacity for entering into combination with anything that is not *A*. It might be a class, or an individual, or a group of qualities, or a single quality, and in any case must be dealt with symbolically in connection with others of like kind; *i.e.*, if I call A a quality, I must deal throughout with qualities, and allow no intensive questions as to the results of combination on classes, or groups of things. It is evident also that, under any view of logic, our cognition of things or classes must start with attributes; and the possibility or impossibility of combination, the extent determined by any combination, depend on the relations of possibly combined position or of exclusion between the constituent attributes. Much of Mr Venn's criticism of Jevons's method involves oversight of this fundamental point.

that addition of each to itself or multiplication of it by itself yields as result only the original unit, are notions. The theory of notions, therefore, is the development of the general formal relations of units under the special restrictions imposed by their nature.[1]

There appears very clearly in Grassmann's treatment the essence of the principle on which symbolic logic proceeds. Thought is viewed as simply the process of positing and negating definite contents or units, and the operations of logic become methods for rendering explicit that which is in each case posited or negated. To apply symbolic methods, we require units as definite as those of quantitative science, and the only laws we can employ are those which spring from the nature of units as definite. Now it seems a profound error to reduce the whole complex process of thinking to this reiterated position of self-identical units. Undoubtedly, if we start from any given fact of thought, as, *e.g.*, a judgment, and inquire what can be exhibited as involved in it, we have before us a problem of analysis, the solution of which must take form in a series of positions and negations; but our thinking is not therefore as a whole mere analysis. The synthetic process by which connections of thought among the objects of our conscious experience are established is not the mechanical aggregation of elementary parts. The relations which give intelligible significance to our experience are not simply those of identity and non-identity. It is an altogether abstract and external view of thought, resting in all probability on an obscure metaphysical principle,[2] that would treat it as in essence the composition and decomposition

[1] See *Die Begriffslehre oder Logik* (1872), p. 48. Schröder (*op. cit.*) follows Grassmann, though with the use of *class* phraseology.

[2] As above noted, p. 147 *sq.*

of elementary atoms, of πρῶτα as Antisthenes would have called them. It has, indeed, been imagined that a symbolic logic might be developed which should be independent in all its fundamental axioms of any metaphysical or psychological assumptions; but this is an illusion. No logical method can be developed save from a most definite conception of the essential nature and *modus operandi* of thinking; and any system of symbolic logic finds it necessary, if it is to be complete and consistent, to adopt some such view as that above criticised, to regard thought as purely analytic, as dealing with compounds or units which are themselves highly complex products, only to be formed by a kind of thought not recognised among logical processes.[1]

39. Formal logic, then, in the ordinary acceptation of that term, does not appear to furnish any adequate representation of the real process and method of thought. Any logical theory must of necessity be formal, *i.e.*, abstract or general; for it can consider only the general elements of thought, not specific knowledge in which are involved the finite, limited relations of one fact or class of facts to another. The distinction between logic and the sciences is therefore precisely that between philosophy in general and the sciences. Attempts have been made to include in logical analysis the treatment of scientific method, *i.e.*, to discuss as matter of logic the varied processes by which scientific results have been attained. It is true that logical consideration must extend to the notions through which scientific experience, like any other,

[1] The same fact has been noted in regard to formal logic of the Kantian school, as, *e.g.*, in Mansel's distinction of psychological and logical judgments.

becomes intelligible, and, in so far as scientific method is but the application of the laws of knowledge as a whole, it is a possible, nay necessary, object of logical treatment. But to include scientific methodology in particular, the consideration of the mechanical devices by which we strive to bring experience into conformity with our ideal of cognition, the discussion of methods of experiment and observation, under the one head logic is an error in principle, whether we view logic in its theoretical aspect or in reference to a special propædeutic aim. Generalisations on such topics are wellnigh worthless; they can have vitality and importance only when drawn in closest conjunction with actual scientific work. The theory of scientific method is either doctrine of knowledge treated freely or else the application of thought in connection with actual research and the ascertainment of the principles therein employed. In either case it is not susceptible of abstraction and isolated treatment.

40. There remains only, of the possible views noted, that which identified logic with the theory of knowledge, but which so defined theory of knowledge as to distinguish it from metaphysics. The designation of logic as theory of knowledge is one to which in words there can be no possible objection. It brings into the foreground what it has been the object of this article, by an historico-critical survey, to establish, that so-called logical laws, forms, and problems are hardly capable of statement, certainly incapable of satisfactory treatment, except in the most intimate connection with the principles of a theory of knowledge. To include, however, in the signification of this latter term a peculiar conception of the relation between thinking (knowing) and reality is at once to restrict the scope of

logic and to place an arbitrary and, one would say, an ill-founded restriction on the kind of treatment to which logical problems may be subjected. If it be really the function of logic to trace the forms and laws of knowledge, that function is all-comprehensive, and must embrace in its scope all the fundamental characteristics of experience as known. But no characteristic of experience is more palpable than the distinction, drawn within conscious experience, between knowledge and reality. It is impossible then for a theory of knowledge to start with the assumption that these two exist separately, constituted each after its special fashion, but with a certain parallelism between them. In words one may refer for justification of the assumption to metaphysics, or to psychology, but, in fact, the problem so relegated to some other discipline is essentially a logical question, and the method of its solution exactly that which must be applied in the treatment of subordinate logical questions. Practical convenience alone can lead to any separation of the problems which under this view are referred in part to theory of knowledge and in part to metaphysics. Other and more serious difficulties of the view have been already commented on.[1]

41. In sum, then, the problems and the methods which compose logic in the strictest sense of that term seem to be one with the problems and methods of the critical theory of knowledge. No other title describes so appropriately as that of "logical" the analysis of knowledge as such, its significance and constitution, in opposition to the quasi-historical or genetic account for which the title psychological should be retained. Were such analysis to be described as "transcendental," no objection could be

[1] Above, p. 127 *sq.*

raised other than that bearing on the advisability of using a special term where a more general one is amply sufficient. Were such analysis described as prevailingly "metaphysical," the only answer could be that the term "metaphysical" has had and has many a signification, and that it is well to avoid the use of an ambiguous and question-begging epithet. Abstract speculations about the nature of reality, essences, and what not are as foreign to a genuine metaphysic as to a commonplace logic. The researches to which we would here assign the title "logical" undoubtedly include all that can supply the place of the older metaphysic, but in aim and method are so distinct that the same title cannot be borne by both. To assign so extensive a range to logical investigations enables us to see that the criteria by which at one time or another a narrower province was determined for logic are but partial expressions of the whole truth. The analysis of knowledge as such, the complete theory of the intelligible elements in conscious experience, does hold a special relation to all other subordinate branches of human thinking, whether philosophic in the ordinary sense of that term or scientific. According as one or other aspect of this relation is made prominent, there comes forward one or other of the various modes for settling the province of logic; but these partial conceptions prove their inadequacy when development is attempted from them, and within the systems constructed in accordance with them there is of necessity continuous reference to inquiries lying beyond the prescribed limits.

A certain analysis of some methods of ordinary thinking, based to a very large extent on language, and resembling in many respects grammatical study, has long been current in educational practice as logic; and to those whose con-

ception of the subject has been formed from acquaintance with this imperfect body of rules and formulæ it may appear a violent and unnecessary extension of the term to apply it to the all-comprehensive theory of knowledge. The reasons, however, are imperative; and, as these would lead one to deny the right of this elementary practical discipline to the possession of the title, it is desirable to conclude by offering a single remark on the place and function of this currently designated logic.

Not much trouble is required in order to see that the ordinary school or formal logic can lay no claim to scientific completeness. Its principles are imperfect, dubious, and most variously conceived; it possesses no method by which development from these principles is possible; it has no criterion by which to test the adequacy of its abstract forms as representations of the laws of concrete thinking. Accordingly it is handled, in whole and in detail, in the most distractingly various fashion, and, were it indeed entitled to the honourable designation of logic, the prospects of that science might well be despaired of. But in fact the school logic discharges a function for which exhaustiveness of logical analysis is not a requisite. It has a *raison d'être* in the circumstance that training to abstract methods must needs be a graduated process, and that, whether as a means towards the prosecution of philosophic study in especial, or as instrument of general educational value, practice in dealing with abstract thoughts must have value. Such elementary practice naturally bases itself on the kinds of distinction apparent in the concrete thinking of those to whom it is applied; and for this reason school logic not only connects itself with and is in a sense the development of grammar and grammatical analysis and synthesis, but

may, to a limited extent, include reference to some of the simpler processes of scientific method. In all probability the discord observable among the ordinary treatises on school logic is due to the want of recognition of the true place which can thus be assigned to the subject treated. The doctrine has a propædeutic but not a scientific value.

Note A

HISTORIES OF LOGIC

No complete history of logic, apart from philosophy in general, exists; and there can be no doubt that any such history, as far at least as modern logic is concerned, must be more or less a historical review of the main philosophical systems and of the influence they have respectively exercised on logical study. But of the Aristotelian logic, in its system and in its development throughout the ancient and mediæval epochs, we possess a most adequate history. Prantl's great work (*Geschichte der Logik im Abendlande*, i., 1855; ii., 1861; iii., 1867; iv., 1870), extending to the close of the mediæval period, is a masterpiece of learned industry and skilled exposition.

The following are some of the more important contributions towards a history of logic, whether in independent works or in portions of systematic treatises; most of them, indeed, of small value: Ramus, *Scholæ Dialecticæ*, bk. i. chaps. 1-8; Keckermann, *Systema Logicæ*, 1598; Gassendi, *Opera*, i. 35-66; Fabricius, *Specimen elenchicum historiæ logicæ*, 1699; Walch, *Parerga Academica* (1721), pp. 453-848; Darjes, *Via ad Veritatem*, appendix, 1755; Buhle, in *Commentat. Soc. Gotting.*, vol. x.; Fülleborn, *Beiträge z. Gesch. d. Phil.* (1794), pt. iv. pp. 160-80; Eberstein, *Gesch. d. Logik u. Metaphysik bei den Deutschen von Leibnitz bis auf gegenwärtige Zeit* (2nd ed., 1794), useful as a survey of the Wolffian logics; Calker, *Denklehre* (1822), pp. 12-198; Bachmann, *System der Logik* (1828), pp. 569-644; Mussmann, *De Logicæ ac Dialecticæ notione historica*, 1828;

Troxler, *Logik* (1830), vol. ii.; Sigwart, *De historia logicæ inter Græcos usque ad Socratem*, 1832; St Hilaire, *De la Logique d'Aristote* (1838), ii. pp. 93-312; Franck, *Esquisse d'une histoire de la logique*, 1838; Reiffenberg, *Principes de logique*, 1833 (with bibliography); Trendelenburg, *Gesch. d. Kategorienlehre*, 1846; Blakey, *History of Logic*, and *Essay on Logic* (2nd ed., 1848), with bibliographical appendix; Hoffmann, *Grundzüge einer Geschichte der Begriff der Logik in Deutschland von Kant bis Baader*, 1851; K. Fischer, *Logik u. Metaphysik* (2nd ed., 1865), pp. 16-182, a valuable critique of some modern doctrines; Rabus, *Logik und Metaphysik* (1868), i. pp. 123-242, excellent; Ueberweg, *System der Logik* (4th ed., 1874), pp. 15-66, excellent critical account; Ragnisco, *Storia critica delle Kategorie*, 1871, 2 vols.; Rabus, *Die neuesten Bestrebungen auf dem Gebiete der Logik bei den Deutschen*, 1880; Harms, *Geschichte der Logik*, 1881; Venn, *Symbolic Logic*, 1881 (introduction, and pp. 405-444), a valuable contribution to the history and bibliography of the application of symbolic methods in logic. The only good bibliography of logic is that given by Rabus in his *Logik u. Metaphysik*, i. pp. 453-518. Some of the older lexicons, *e.g.*, Lipenius, *Bibliotheca Realis* (1685), *s. vv.* "Logica," "Organon," "Dialectica," contain great store of bibliographical references. A complete bibliography is a desideratum.

Note B

HINDU SYSTEMS OF LOGIC

In almost all the Hindu systems of philosophy, as these are classified by the most recent authorities, indications are to be found of a more or less developed analysis of the process or method of reasoning, and therefore of a certain amount of logical theory. In two systems in particular the logical element is the most prominent feature. The *Nyâya*, or logical doctrine of Gotama, is in a very special sense the Hindu logic, while in the *Vaiseschika*, or Atomist system of

Kanada, there are many expansions of or additions to the *Nyâya*, though the prevailing interest is not logical.

The most accessible sources of information regarding the Hindu logic, Colebrooke's *Essays*, and Professor M. Müller's abstract (in the appendix to Archbishop Thomson's *Laws of Thought*), tend to mingle in an undesirable fashion what is special to the Nyâya doctrine, and what is added by Kanada and his followers. In order to appreciate the extent to which the analysis of reasoning has been carried in these early systems, it is advisable to restrict attention to the original exposition of the *Nyâya*.

The aim of Nyâya is the attainment of perfection, of bliss, through knowledge. But, to have knowledge in a systematic and complete fashion, it is requisite that the individual should know (or should be capable of organising his knowledge in reference to) the sixteen great topics or heads of discussion. These, as enumerated by Gotama, are—(1) proof; (2) the objects of proof; (3) doubt; (4) motive; (5) the illustration or example for discussion; (6) the final assertion; (7) the enumeration of the five members of the final assertion; (8) confirmatory argument; (9) the conclusion, the defined judgment; (10) the objection; (11) controversy; (12) deceptive counter argument; (13) apparent reason or sophism; (14) fraud or wilfully deceptive argument, ruse; (15) futile argument or self-contradictory counter argument; (16) conclusive refutation. Inspection of these at once shows that they represent stages in dialectic or in the process of clearing up knowledge by discussion.

The generalia, *i.e.*, the kinds of proof, described as four in number—sense-perception, inference (either from cause to effect, from effect to cause, or from community of nature, *i.e.*, in a wide sense, analogy), comparison (analogy in a stricter significance), tradition—and the things about which proof may be exercised, under which a twelvefold division is given by Gotama, and enlarged in endless detail by his commentators, who introduce thereunder much of Kanada's system, are first laid down as the basis for the whole. Then follows (Nos. 3-6) the progress from doubt, which first calls for reasoning or proof, through motive, to position of the problem in the form of an example or case, and to the general assertion, as having valid grounds.

The analysis of the grounds of assertion is then given, and here we have what corresponds more particularly to the syllogism as known to us. Five members are signalised: (1) the thesis or proposition to be proved; (2) the reason, or intermediate ground by which the subject of the proposition is linked on to an explanatory principle; (3) the explanatory principle; (4) the application of this explanatory principle; (5) the statement of the conclusion as following from the application. Thus, in the example usually given—(1) *thesis*, this mountain is fiery; (2) *intermediate ground*, because it smokes; (3) *explanatory principle*, whatever smokes is fiery, as, for instance, a hearth; (4) *application*, therefore this mountain is fiery; (5) *statement of conclusion*, the mountain, then, is fiery, because it smokes. There can be no doubt that in this somewhat unsystematic arrangement we have the outlines of syllogistic argument. Considerable obscurity, however, rests over the third member, and it is only partially cleared up when we proceed to the next topic, which may perhaps be translated confirmatory argument. Here the essence of the argument appears to be a regress from the known mark to the fundamental quality from which it follows. Thus, *e.g.*, if it were said *the mountain is not fiery*, then the argument would be adduced, but *the mountain smokes*, and what is not fiery does not smoke. Apparently there is involved the assumption that the mark is a necessary consequence of the primary quality, but the exposition is obscure, and, doubtless, connects itself with the principles of causal connection recognised by Hindu thinkers. (See Williams, as below, pp. 73-4).

When the conclusion has thus been confirmed, when the negation of the ground has been shown to fail in explaining the observed fact, the thesis may be stated in an absolute and definitive form (topic 9). The remaining seven topics are then concerned with the discussion which may arise when an opponent brings forward objections to the conclusion. This he must do by positing his antithesis (10), whereupon issue may be joined (11). Should the adversary be unable to establish his antithesis, he may resort to deceit, bringing forward arguments, illogically arranged and devoid of force (12), which soon leads to the employment of sophisms (13) or merely apparent arguments, and even to

deceitful ruses (14). Under these topics the *Nyâya* signalises and discusses various well-known forms of fallacy. The destruction of all these fallacious arguments reduces the opponent to the employment of futile, irrelevant responses, which undermine his own position (15), and the exposure of which completes his discomfiture and reduces him to silence (16).

Expositions of this dialectic system are not yet available in such kind and amount as would enable one to do full justice to it. Evidently much patience and a very considerable knowledge of the current philosophical view would be requisite in order to appreciate at their true worth many apparently formal, and in some cases dubious, divisions. Of accounts which may be consulted the following seem the more important: Colebrooke's *Essays on the Religion and Philosophy of the Hindus*, from which the expositions in Ritter (*Ges. d. Phil.*, iv. 382 *sq.*), Hegel (*Werke*, xiii. 161-167), and Cousin (*Histoire Générale*, Leçon ii.) are taken; Ward's *Account of the History, Literature, and Religion of the Hindoos* (4 vols., 1811; later editions, with title altered, in 1815, 1817, 1821); Windischmann, *Philosophie im Fortgange der Weltgeschichte* (1834), specially pp. 1895-1920; M. Müller, appendix to Thomson's *Laws of Thought;* Rozenkranz, *Die Modificationen der Logik* (1846), pp. 184-97. Williams, *Indian Wisdom*, pp. 71-88; St Hilaire, articles "Indiens," "Gotama," "Nyâya," "Kanada," in the *Dictionnaire Philosophique*, and translation, with commentary, of part of Gotama's "Sûtras," in the *Mémoires de l'Académie des Sciences Morales et Politiques*, tom. iii.

Note C

RAMUS

The logical theories of Ramus acquired for a brief period a factitious importance from their connection with the general revolt against Aristotelianism, and with the Protestant struggle against the Roman Catholic authority.

In themselves they have no particular value, nor indeed much originality, and the exposition of them by their author, always rather literary than philosophic, adds nothing of strength or interest. In comparison with the Aristotelian analysis of the forms and methods of thinking, the few alterations of statement, and generally the thin residuum of logical theory, which characterise Ramist work, appear as singularly insignificant. Nor have any of the special peculiarities of the Ramist logic exercised influence on the history of logical doctrines. The keenness of the controversy which raged in so many of the centres of learning between the Aristotelians and the total or partial Ramists is explicable only as having reference to differences which were merely symbolised by the apparent difference in logical doctrine.

In the Protestant universities and seminaries generally the Ramist logic obtained, and for some time kept, a firm footing. In Scotland, through Melville, Buchanan, and the Earl of Murray, who had been a pupil of Ramus, his system was installed as the orthodox staple of logical training, and such records as remain of Scottish university education during the troubled sixteenth century would undoubtedly exhibit the traces of this new movement. In England, Cambridge alone, always disposed to reject the authority of Aristotle, and generally more open to new ideas than the sister university, was a stronghold of Ramism, and, apart from special works of Ramist tendency, the influence of the new doctrine is discernible in the writings of more than one Cambridge alumnus. William Temple, a friend of Sir Philip Sidney, and an official of the university, published a volume of *Scholia in Rami Dialecticam*, 1591; George Downam, prælector on logic, wrote commentaries *In Petri Rami Dialecticam*, 1606; and Milton, in 1672, expanded the *Dialectica* in his *Artis Logicæ Plenior Institutio*. Marlowe's *Faustus*, and his *Massacre of St Bartholomew*, show how familiar Ramist phraseology and the personality of Ramus must have been to an alumnus of Cambridge, while Bacon, with well-grounded objection to much of the Ramist method, expounds the system of logic with unmistakable reference to the Ramist principles and method of arrangement. There is a monograph on Ramus by Ch. Waddington

with a good bibliography—*Ramus (Pierre de la Ramée): sa Vie, ses Écrits, et ses Opinions*, Paris, 1856—and a slighter work, mainly biographical, by Ch. Desmaze (*P. Ramus, Professeur au Collége de France: sa Vie, ses Écrits, sa Mort*, 1515-72, Paris, 1864). In Lipenius (*Bibliotheca Realis, s.v.* "Ramus") will be found a long list of writings for and against the Ramist logic. The history of the movement is also given in Buhle (*Gesch. d. neuern Phil.*, ii. 680-702), Tennemann (*Gesch. d. Phil.*, ix. pp. 420-42), Du Boulay (*Hist. Univer. Paris*, tom. iv.), Crevier (*Hist. de l'Univ. de Paris*, vol. v.), in Jo. Hermannus ab Elswich (*Schediasma de varia Aristotelis in scholis Protestantium fortuna*, §§ 21-29), De Launoy (*De Varia Aristot. in Acad. Paris. fortuna*, cap. xiii.), and in Bayle (*Dictionnaire, s.v.* "Ramus").

SUPPLEMENTARY ARTICLES

I

CATEGORY

Category, a term first introduced into the philosophical vocabulary by Aristotle, means etymologically an accusation. Even in the writings of Aristotle the word occurs once or twice in this its primary acceptation, but generally it has there a definite and technical signification. So also in Aristotle the verb *κατηγορεῖν*, to accuse, takes the specific logical sense, to predicate; *τὸ κατηγορούμενον* becomes the predicate; and *κατηγορικὴ πρότασις* may be translated as affirmative proposition. But though the word thus received a new signification from Aristotle, it is not on that account certain that the thing it was taken to signify was equally a novelty in philosophy. We do find in the records of Oriental and early Greek thought something corresponding to the Aristotelian classification.

Our knowledge of Hindu philosophy, and of the relations in which it may have stood to Greek speculation, is not yet adequate to give decisive answers to various questions

that naturally arise on observation of their many resemblances; and it might therefore appear irrelevant to introduce into an historical notice of a peculiarly Western doctrine any reference to its Eastern counterpart. Yet the similarity between the two is so striking that, if not historically connected, they must at least be regarded as expressions of similar philosophic wants. The Hindu classification to which we specially refer is that of Kanada, who lays down six categories, or classes of existence, a seventh being generally added by the commentators. The term employed is Padârtha, meaning "signification of a word." This is in entire harmony with the Aristotelian doctrine, the categories of which may with truth be described as significations of simple terms, *τὰ κατὰ μηδεμίαν συμπλοκὴν λεγόμενα*. The six categories of Kanada are Substance, Quality, Action, Genus, Individuality, and Concretion or Co-inherence. To these is added Non-Existence, Privation, or Negation. *Substance* is the permanent sub-strate in which *Qualities* exist. *Action*, belonging to or inhering in substances, is that which produces change. *Genus* belongs to substance, qualities, and actions; there are higher and lower genera. *Individuality*, found only in substance, is that by which a thing is self-existent and marked off from others. *Concretion* or Co-inherence denotes inseparable or necessary connection, such as that between substance and quality. Under these six classes, *γένη τοῦ ὄντος*, Kanada then proceeds to range the facts of the universe.[1]

Within Greek philosophy itself there were foreshadow-

[1] For details of this and other Hindu systems see Colebrooke, *Essays;* H. H. Wilson, *Essays;* Williams, *Indian Wisdom;* Gough's *Vaiseshika-Sutras;* M. Müller, *Sanskrit Literature*, and particularly his Appendix to Thomson's *Laws of Thought.*

ings of the Aristotelian doctrine, but nothing so important as to warrant the conclusion that Aristotle was directly influenced by it. Doubtless the One and Many, Being and Non-Being, of the Eleatic dialectic, with their subordinate oppositions, may be called categories, but they are not so in the Aristotelian sense, and have little or nothing in common with the later system. Their starting-point and results are wholly diverse. Nor does it appear necessary to do more than mention the Pythagorean table of principles, the number of which is supposed to have given rise to the decuple arrangement adopted by Aristotle. The two classifications have nothing in common; no term in the one list appears in the other; and there is absolutely nothing in the Pythagorean principles which could have led to the theory of the categories.[1]

One naturally turns to Plato when endeavouring to discover the genesis of any Aristotelian doctrine, and undoubtedly there are in the Platonic writings many detached discussions in which the matter of the categories is touched upon. Special terms also are anticipated at various times, *e.g.*, ποιότης in the *Theætetus*, ποιεῖν and πάσχειν in the *Gorgias*, and πρός τι in the *Sophist*.[2] But there does not seem to be anything in Plato which one could say gave occasion directly and of itself to the Aristotelian doctrine; and, even when we take a more comprehensive view of the Platonic system and inquire what in it corresponds to the widest definition of categories, say as ultimate elements of thought and existence, we receive no very definite answer.

[1] The supposed origin of that theory in the treatise περὶ τοῦ παντός, ascribed to Archytas (c. 428-347 B.C.), has been proved to be an error. The treatise itself dates in all probability from the Neo-Pythagorean schools of the second century A.D.

[2] Prantl, *Ges. d. Logik*, i. 74-75; Trendelenburg, *Kategorienlehre*, 209, *n.*

The Platonic dialectic never worked out into system, and only in two dialogues do we get anything like a list of ultimate or root-notions. In the *Sophist*, Being, Rest, and Motion (*τὸ ὂν αὐτὸ καὶ στάσις καὶ κίνησις*) are laid down as *μέγιστα τῶν γενῶν*.[1] To these are presently added the Same and the Other (*ταὐτὸν καὶ θάτερον*), and out of the consideration of all five some light is cast upon the obscure notion of Non-Being (*τὸ μὴ ὄν*). In the same dialogue (262, *sq.*) is found the important distinction of *ὄνομα* and *ῥῆμα*, noun and verb. The *Philebus* presents us with a totally distinct classification into four elements—the Infinite, the Finite, the Mixture or Unity of both, and the Cause of this unity (*τὸ ἄπειρον, τὸ πέρας, ἡ σύμμιξις, ἡ αἰτία*). It is at once apparent that, however these classifications are related to one another and to the Platonic system, they lie in a different field from that occupied by the Aristotelian categories, and can hardly be said to have anything in common with them.

The Aristotelian doctrine is most distinctly formulated in the short treatise *Categoriæ*, which generally occupies the first place among the books of the *Organon*. The authenticity of the treatise was doubted in early times by some of the commentators, and the doubts have been revived by such scholars as Spengel and Prantl. On the other hand, Brandis, Bonitz, and Zeller are of opinion that the tract is substantially Aristotle's. The matter is hardly one that can be decided either *pro* or *con* with anything like certainty; but this is of little moment, for the doctrine of the categories, even of the *ten* categories, does not stand or fall with only one portion of Aristotle's works.

It is surprising that there should yet be so much uncertainty as to the real significance of the categories, and that

[1] *Soph.*, 254, D.

we should be in nearly complete ignorance as to the process of thought by which Aristotle was led to the doctrine. On both points it is difficult to extract from the matter before us anything approaching a satisfactory solution. The terms employed to denote the categories have been scrutinised with the utmost care, but they give little help. The most important—*κατηγορίαι τοῦ ὄντος* or *τῆς οὐσίας*, *γένη τοῦ ὄντος* or *τῶν ὄντων*, *γένη* simply, *τὰ πρῶτα* or *τὰ κοινὰ πρῶτα*, *αἱ πτώσεις*, or *αἱ διαιρέσεις*—only indicate that the categories are general classes into which Being as such may be divided, that they are *summa genera*. The expressions *γένη τῶν κατηγορίων* and *σχήματα τῶν κατηγορίων*, which are used frequently, seem to lead to another and somewhat different view. *Κατηγορία* being taken to mean that which is predicated, *γένη τῶν κατηγορίων* would signify the most general classes of predicates, the framework into the divisions of which all predicates must come. To this interpretation there are objections. The categories must be carefully distinguished from predicables; in the scholastic phraseology the former refer to *first intentions*, the latter to *second intentions*—*i.e.*, the one denote real, the other logical connection. Further, the categories cannot without careful explanation be defined as predicates; they are this and something more. The most important category, *οὐσία*, in one of its aspects cannot be predicate at all.

In the *Categoriæ* Aristotle prefixes to his enumeration a grammatico-logical disquisition on homonyms and synonyms, and on the elements of the proposition, *i.e.*, subject and predicate. He draws attention to the fact that things are spoken of either in the connection known as the proposition, *e.g.*, "a man runs," or apart from such connection, *e.g.*, "man" and "runs." He then proceeds, "Of things spoken of apart from their connection in a proposition (*τῶν*

κατὰ μηδεμίαν συμπλοκὴν λεγομένων), each signifies either Substance (οὐσία), or Quantity (ποσόν), or Quality (ποιόν), or Relation (πρός τι), or Where (*i.e.*, Place, ποῦ), or When (*i.e.*, Time, ποτέ), or Position (κεῖσθαι), or Possession (ἔχειν), or Action (ποιεῖν), or Passion (πάσχειν). Οὐσία, the first category, is subdivided into πρώτη οὐσία or primary substance, which is defined to be τόδε τι, the singular thing in which properties inhere, and to which predicates are attached, and δεύτεραι οὐσίαι, genera or species which can be predicated of primary substances, and are therefore οὐσία only in a secondary sense. Nevertheless, they too, after a certain fashion, signify the singular thing, τόδε τι (*Categ.*, p. 3b 12, 13). It is this doctrine of πρώτη οὐσία that has raised doubts with regard to the authenticity of the *Categoriæ*. But the tenfold classification, which has also been captiously objected to, is given in an acknowledged writing of Aristotle's (see *Topica*, i. 9, p. 103b 20).[1] At the same time it is at least remarkable that in two places where the enumeration seems intended to be complete (*Met.*, p. 1017a 25; *An. Pos.*, i. 22, p. 83a 21), only eight are mentioned, ἔχειν and κεῖσθαι being omitted. In other passages[2] six, five, four, and three are given, frequently with some addition, such as καὶ αἱ ἄλλαι κατηγορίαι. It is also to be observed that, despite of this wavering, distinct intimations are given by Aristotle that he regarded his list as complete, and he uses phrases which would seem to indicate that the division had been exhaustively carried out. He admits certainly that some predicates which come under one category might be referred to another, but he declines to deduce

[1] Against this passage even the cross-grained Prantl can raise no objection of any moment; see *Ges. der Logik*, i. 206, *n.*

[2] See Bonitz, *Index Aristotelicus*, *s.v.*, and Prantl, *Ges. d. Log.*, i. 207.

all from one highest class, or to recognise any relation of subordination among the several classes.

The full import of the categories will never be adequately reached from the point of view taken up in the *Categoriæ*, which bears all the marks of an early and preliminary study. For true understanding we must turn to the *Metaphysics*, where the doctrine is handled at large. The discussion of Being in that work starts with a distinction that at once gives us a clue. Τὸ ὄν is spoken of in many ways; of these four are classified—*τὸ ὂν κατὰ συμβεβηκός, τὸ ὂν ὡς ἀληθές, τὸ ὂν δυνάμει καὶ ἐνεργείᾳ*, and *τὸ ὂν κατὰ τὰ σχηματὰ τῶν κατηγορίων*. It is evident from this that the categories can be regarded neither as purely logical nor as purely metaphysical elements. They indicate the general forms or ways in which Being can be predicated; they are determinations of Being regarded as an object of thought, and consequently as matter of speech. It becomes apparent also why the analysis of the categories starts from the singular thing, for it is the primary form under which all that is becomes object of knowledge, and the other categories modify or qualify this real individual. *Πάντα δὲ τὰ γιγνόμενα ὑπό τέ τινος γίγνεται καὶ ἔκ τινος καὶ τί. Τὸ δὲ τί λέγω καθ' ἑκάστην κατηγορίαν· ἢ γὰρ τόδε ἢ ποσὸν ἢ ποιὸν ἢ ποῦ* (*Met.*, p. 1032a 13-15). . . . The categories, therefore, are not logical forms but real predicates; they are the general modes in which Being may be expressed. The definite thing, that which comes forward in the process from potentiality to full actuality, can only appear and be spoken of under forms of individuality, quality, quantity, and so on. The nine later categories all denote entity in a certain imperfect fashion.

The categories then are not to be regarded as heads of predicates, the framework into which predicates can be

thrown. They are real determinations of Being—*allgemeine Bestimmtheiten*, as Hegel calls them. They are not *summa genera* of existences, still less are they to be explained as a classification of nameable things in general. The objections Mill has taken to the list are entirely irrelevant, and would only have significance if the categories were really—what they are not—an exhaustive division of concrete existences. Grote's view (*Aristotle*, i. 108) that Aristotle drew up his list by examining various popular propositions, and throwing the different predicates into genera, "according as they stood in different logical relation to the subject," has no foundation. The relation of the predicate category to the subject is not entirely a logical one; it is a relation of real existence, and wants the essential marks of the propositional form. The logical relations of τὸ ὄν are provided for otherwise than by the categories.

Aristotle has given no intimation of the course of thought by which he was led to his tenfold arrangement, and it seems hopeless to discover it. Trendelenburg in various essays has worked out the idea that the root of the matter is to be found in grammatical considerations, that the categories originated from investigations into grammatical functions, and that a correspondence will be found to obtain between categories and parts of speech. Thus, Substance corresponds to noun substantive, Quantity and Quality to the adjective, Relation partly to the comparative degree and perhaps to the preposition, When and Where to the adverbs of time and place, Action to the active, Passion to the passive of the verb, Position (κεῖσθαι) to the intransitive verb, ἔχειν to the peculiar Greek perfect. That there should be a very close correspondence between the categories and grammatical elements is by no means surprising; that the one were deduced from the other is

both philosophically and historically improbable. Reference to the detailed criticisms of Trendelenburg by Ritter, Bonitz, and Zeller will be sufficient.

Aristotle has also left us in doubt on another point. Why should there be only *ten* categories? and why should these be the ten? Kant and Hegel, it is well known, signalise as the great defect in the Aristotelian categories the want of a principle, and yet some of Aristotle's expressions would warrant the inference that he *had* a principle, and that he thought his arrangement exhaustive. The leading idea of all later attempts at reduction to unity of principle, the division into substance and accident, was undoubtedly not overlooked by Aristotle, and Brentano has collected with great diligence passages which indicate how the complete list might have been deduced from this primary distinction. His tabular arrangements (pp. 175, 177) are particularly deserving of attention. The results, however, are hardly beyond the reach of doubt.

There was no fundamental change in the doctrine of the categories from the time of Aristotle to that of Kant, and only two proposed re-classifications are of such importance as to require notice. The Stoics adopted a fivefold arrangement of highest classes, *γενικώτατα*. Τὸ ὄν or *τί*, Being, or somewhat in general, was subdivided into *ὑποκείμενα* or subjects, *ποιά* or qualities in general, which give definiteness to the blank subject, *πῶς ἔχοντα*, modes which further determine the subject, and *πρός τι πῶς ἔχοντα*, definite relative modes. These categories are so related that each involves the existence of one higher than itself, thus there cannot be a *πρός τι πῶς ἔχον* which does not rest upon or imply a *πῶς ἔχον*, but *πῶς ἔχον* is impossible with-

[1] Brentano, *Bedeutung des Seienden nach Aristoteles*, pp. 148-178.

out *ποιόν*, which only exists in *ὑποκείμενον*, a form or phase of *τὸ ὄν*.[1]

Plotinus, after a lengthy critique of Aristotle's categories, sets out a twofold list. *Τὸ ἕν, κίνησις, στάσις, ταὐτότης, ἑτερότης* are the primitive categories (*πρῶτα γένη*) of the intelligible sphere. *Οὐσία, πρός τι, ποιά, ποσόν, κίνησις* are the categories of the sensible world. The return to the Platonic classification will not escape notice.

Modern philosophy, neglecting altogether the dry and tasteless treatment of the Aristotelian doctrine by scholastic writers, gave a new, a wider, and deeper meaning to the categories. They now appear as ultimate or root notions, the metaphysical or thought elements, which give coherence and consistency to the material of knowledge, the necessary and universal relations which obtain among the particulars of experience. There was thus to some extent a return to Platonism; but in reality, as might easily be shown, the new interpretation was, with due allowance for difference in point of view, in strict harmony with the true doctrine of Aristotle. The modern theory dates in particular from the time of Kant, who may be said to have reintroduced the term into philosophy. Naturally there are some anticipations in earlier thinkers. The Substance, Attribute, and Mode of Cartesianism can hardly be classed among the categories; nor does Leibniz's chance suggestion of a fivefold arrangement into Substance, Quantity, Quality, Action and Passion, and Relations, demand any particular notice. Locke, too, has a classification into Substances, Modes, and Relations, but in it he has manifestly no intention of drawing up a table of categories. What in his system

[1] For detailed examination of the Stoic categories, see Prantl, *Ges. d. Logik*, i. 428, *sqq.*; Zeller, *Ph. d. Gri.*, iii. 1, 82, *sqq.*; Trendelenburg, *Kateg.*, p. 217.

corresponds most nearly to the modern view of these elements is the division of kinds of real predication. In all judgments of knowledge we predicate either (1) Identity or Diversity, (2) Relation, (3) Coexistence, or necessary connection, or (4) Real existence. From this the transition was easy to Hume's important classification of *philosophical relations* into those of Resemblance, Identity, Time and Place, Quantity or Number, Quality, Contrariety, Cause and Effect.

These attempts at an exhaustive distribution of the necessary relations of all objects of knowledge indicate the direction taken by modern thought, before it received its complete expression from Kant.

The doctrine of the categories is the very kernel of the Kantian system, and, through it, of later German philosophy. To explain it fully would be to write the history of that philosophy. The categories are called by Kant root-notions of the understanding (*Stammbegriffe des Verstandes*), and are briefly the specific forms of the *a priori* or formal element in rational cognition. It is this distinction of matter and form in knowledge that marks off the Kantian from the Aristotelian doctrine. To Kant knowledge was only possible as the synthesis of the material or *a posteriori* with the formal or *a priori*. The material to which *a priori* forms of the understanding were applied was the sensuous content of the pure intuitions, time and space. This content could not be *known* by sense, but only by intellectual function. But the understanding in the process of knowledge makes use of the universal form of synthesis, the judgment; intellectual function is essentially of the nature of judgment or the reduction of a manifold to unity through a conception. The specific or type forms of such function will, therefore, be expressed in

judgments; and a complete classification of the forms of judgments is the key by which one may hope to discover the system of categories. Such a list of judgments Kant thought he found in ordinary logic, and from it he drew up his well-known scheme of the twelve categories. These forms are the determinations of all objects of experience, for it is only through them that the manifold of sense can be reduced to the unity of consciousness, and thereby constituted experience. They are *a priori* conditions, subjective in one sense, but objective as being universal, necessary, and constitutive of experience.

The table of logical judgments with corresponding categories is as follows:—

Judgments.		Categories.
Universal ...	I. Of Quantity	Unity.
Particular ...		Plurality.
Singular		Totality.
Affirmative ...	II. Of Quality	Reality.
Negative		Negation.
Infinite		Limitation.
Categorical ...	III. Of Relation	Inherence and Subsistence (Substance and Accident).
Hypothetical		Causality and Dependence (Cause and Effect).
Disjunctive...		Community (Reciprocity).
Problematical	IV. Of Modality	Possibility and Impossibility.
Assertoric ...		Existence and Non-Existence.
Apodictic ...		Necessity and Contingency.

Kant, it is well known, criticises Aristotle severely for having drawn up his categories without a principle, and claims to have disclosed the only possible method by which an exhaustive classification might be obtained. What he criticised in Aristotle is brought against his own procedure by the later German thinkers, particularly Fichte and Hegel. And in point of fact it cannot be denied that Kant has allowed too much completeness to the ordinary logical dis-

tribution of propositions; he has given no proof that in these forms are contained all species of synthesis, and in consequence he has failed to show that in the categories, or pure conceptions, are contained all the modes of *a priori* synthesis. Further, his principle has so far the unity he claimed for it, the unity of a single function, but the specific forms in which such unity manifests itself are not themselves accounted for by this principle. Kant himself hints more than once at the possibility of a completely rational system of the categories, at an evolution from one single movement of thought, and in his *Remarks on the Table of the Categories* gave a pregnant hint as to the method to be employed. From any complete realisation of this suggestion Kant, however, was precluded by one portion of his theory. The categories, although the necessary conditions under which alone an object of experience can be thrown, are merely forms of the mind's own activity; they apply only to sensuous and consequently subjective material. Outside of and beyond them lies the thing-in-itself, the blankest and emptiest of abstractions, which yet to Kant represented the ultimately real.

This subjectivism was a distinct hiatus in the Kantian system, and against it principally Fichte and Hegel directed criticism. It was manifest that at the root of the whole system of categories there lay the synthetising unity of self-consciousness, and it was upon this unity that Fichte fixed as giving the possibility of a more complete and rigorous deduction of the pure notions of the understanding. Without the act of the Ego, whereby it is self-conscious, there could be no knowledge, and this primitive act or function must be, he saw, the *position* or affirmation of itself by the Ego. The first principle then must be that the Ego posits itself as the Ego, that the Ego = Ego, a principle which is un-

conditioned both in form and matter, and therefore capable of standing absolutely first, of being the *prius* in a system. Metaphysically regarded this act of self-position yields the categories of Reality. But, so far as matter is concerned, there cannot be affirmation without negation, *omnis determinatio est negatio.* The determination of the Ego presupposes or involves the Non-Ego. The form of the proposition in which this second act takes to itself expression, the Ego is not = Not-Ego, is unconditioned, not derivable from the first. It is the absolute antithesis to the primitive thesis. The category of Negation is the result of this second act. From these two propositions, involving absolutely opposed and mutually destructive elements, there results a third which reconciles both in a higher synthesis. The notion in this third is determination or limitation; the Ego and Non-Ego limit, and are opposed to, one another. From these three positions Fichte proceeds to evolve the categories by a series of thesis, antithesis, and synthesis.

In thus seizing upon the unity of self-consciousness as the origin for systematic development, Fichte has clearly taken a step in advance of, and yet in strict harmony with, the Kantian doctrine. For, after all that can be said as to the demonstrated character of formal logic, Kant's procedure was empirical, and only after the list of categories had been drawn out, did he bring forward into prominence what gave them coherence and reality. The peculiar method of Fichte, also, was nothing but a consistent application of Kant's own *Remark on the Table of the Categories.* Fichte's doctrine, however, is open to some of the objections advanced against Kant. His method is too abstract and external, and wants the unity of a single principle. The first two of his fundamental propositions stand isolated

from one another, not to be resolved into a primitive unity. With him, too, the whole stands yet on the plane of subjectivity. He speaks, indeed, of the universal Ego as distinct from the empirical self-consciousness; but the universal does not rise with him to concrete spirit. Nevertheless the *Wissenschaftslehre* contains the only real advance in the treatment of the categories from the time of Kant to that of Hegel.[1] This, of course, does not imply that there were not certain elements in Schelling, particularly in the *Transcendental Idealism*, that are of value in the transition to the later system; but on the whole it is only in Hegel that the whole matter of the Kantian categories has been assimilated and carried to a higher stage.

The Hegelian philosophy, in brief, is a system of the categories; and, as it is not intended here to expound that philosophy, it is impossible to give more than a few general and quite external observations as to the Hegelian mode of viewing these elements of thought. With Kant, as has been seen, the categories were still subjective, not as being forms of the individual subject, but as having over against them the world of *noumena* to which they were inapplicable. Self-consciousness, which was, even with Kant, the *nodus* or kernel whence the categories sprang, was nothing but a logical centre,—the reality was concealed.

[1] It does not seem necessary to do more than refer to the slight alterations made on Kant's Table of Categories by Herder (in the *Metakritik*), by Maimon in the *Propadeutik zu einer neuen Theorie des Denkens*), by Fries (in the *Neue Kritik der Vernunft*), or by Schopenhauer, who desired to reduce all the categories to one—that of Causality. We should require a new philosophical vocabulary even to translate the extraordinary compounds in which Krause expounds his theory of the categories. Notices of the changes introduced by Rosmini, and of Gioberti's remarkable theory, will be found in Ragnisco's work referred to below.

There was thus a dualism, to overcome which is the first step in the Hegelian system. The principle, if there is to be one, must be universally applicable, all-comprehensive. Self-consciousness is precisely the principle wanted; it is a unity, an identity, containing in itself a multiplicity. The universal in absolute self-consciousness is just pure thinking, which in systematic evolution is the categories; the particular is the natural or multiform, the external as such; the concrete of both is spirit, or self-consciousness come to itself. The same law that obtains among the categories is found adequate to an explanation of the external thing which had so sadly troubled Kant. The categories themselves are moments of the universal of thought, type forms, or definite aspects which thought assumes; determinations, *Bestimmungen*, as Hegel most frequently calls them. They evolve by the same law that was found to be the essence of ultimate reality—*i.e.*, of self-consciousness. The complete system is pure thought, the Universal *par excellence.*

After the Hegelian there can hardly be said to have been a philosophical treatment of the categories in Germany, which is not more or less a criticism of that system. It does not seem necessary to mention the unimportant modifications introduced by Kuno Fischer, Erdmann, or others belonging to the school. In the strongly-opposed philosophy of Herbart, the categories can hardly be said to hold a prominent place. They are, with him, the most general notions which are psychologically formed, and he classifies them as follows: (1) Thing, either as product of thought, or as given in experience; (2) Property, either qualitative or quantitative; (3) Relation; (4) The Negated. Along with these, he posits as categories of inner process—(1) Sensation, (2) Cognition, (3) Will, (4) Action. George,[1]

[1] *Lehrbuch der Metaphysik*, 1844.

who in the main follows Schleiermacher, draws out a table of categories which shows, in some points, traces of Herbartian influence. His arrangement by enneads, or series of nine, is fanciful, and wanting in inner principle.

The most imposing recent attempt at a reconstruction of the categories is that of Trendelenburg. To him the first principle, or primitive reality, is Motion, which is both real as external movement, and ideal as inner construction. The necessary conditions of Motion are Time and Space, which are both subjective and objective. From this point onwards are developed the mathematical (point, line, &c.) and real (causality, substance, quantity, quality, &c.) categories which appear as involved in the notion of motion. Matter cannot be regarded as a product of motion; it is the condition of motion; we must think something moved. All these categories, "under the presupposition of motion as the first energy of thought, are ideal and subjective relations; as also, under the presupposition of motion as the first energy of being, real and objective relations."[1] A serious difficulty presents itself in the next category, that of End (*Zweck*), which can easily be thought for inner activity, but can hardly be reconciled with real motion. Trendelenburg solves the difficulty only empirically, by pointing to the insufficiency of the merely mechanical to account for the organic. The consideration of Modality effects the transition to the forms of logical thought. On the whole, Trendelenburg's unique fact of motion seems rather a blunder. There is much more involved than he is willing to allow, and motion *per se* is by no means adequate to self-consciousness. His theory has found little favour.

Ulrici works out a system of the categories from a psychological or logical point of view. To him the funda-

[1] *Logische Untersuchungen*, i. 376-7.

mental fact of philosophy is the distinguishing activity (*unterscheidende Thätigkeit*) of thought. Thought is only possible by distinction, difference. The fixed points in the relations of objects upon which this activity turns are the categories, which may be called the forms or laws of thoughts. They are the aspects of things, notions under which things must be brought, in order to become objects of thought. They are thus the most general predicates or heads of predicates. The categories cannot be completely gathered from experience, nor can they be evolved *a priori;* but, by attending to the general relations of thought and its purely indefinite matter, and examining what we must predicate in order to know being, we may attain to a satisfactory list. Such list is given in great detail in the *System der Logik* (1852), and in briefer, preciser form in the *Compendium der Logik* (2nd ed., 1872); it is in many points well deserving of attention.

The definition of the categories by the able French logician Renouvier, in some respects resembles that of Ulrici. To him the primitive fact is Relation, of which all the categories are but forms. "The categories," he says, "are the primary and irreducible laws of knowledge, the fundamental relations which determine its form and regulate its movements." His table and his criticism of the Kantian theory are both of interest.[1]

The criticism of Kant's categories by Cousin and his own attempted classification are of no importance. Of more interest to us, though not of much more value, is the elaborate table drawn out by Sir W. Hamilton.[2] The generalised category of the *Conditioned* has but little

[1] *Essais de Critique Generale*, 2nd ed.; *La Logique*, i. pp. 184, 190, 207-225.

[2] *Discussions*, p. 577.

meaning, and the subordinate categories evolve themselves by no principle, but are arranged after a formal and quite arbitrary manner. They are never brought into connection with thought itself, nor could they be shown to spring from its nature and relations.

J. S. Mill has presented, "as a substitute for the abortive classification of Existences, termed the categories of Aristotle," the following as an enumeration of all nameable things: (1) Feelings, or states of consciousness; (2) The minds which experience these feelings; (3) Bodies, or external objects which excite certain of those feelings; (4) Successions and coexistences, likenesses and unlikenesses, between feelings or states of consciousness.[1] This classification proceeds on a quite peculiar view of the categories, and is only presented here for the sake of completeness.

Trendelenburg, *Geschichte der Kategorienlehre*, 1846; Ragnisco, *Storia critica delle Categorie*, 2 vols. 1871. For Aristotle's doctrine the most important, in addition to Brandis, Zeller, and the above, are Bonitz, *Sitzungsber. d. kön. Akad. d. Wissen.*, Wien, 1853, pp. 591-645; Prantl, *Ges. d. Logik*, i.; and Brentano, *Bedeutung des Seienden nach Aristoteles*, 1862. II

LOTZE'S LOGIC

THE translation of the volumes in which Lotze, towards the close of his long career as thinker and teacher, began to arrange in systematic form the ripest fruits of his reflection, is a contribution of the highest value to English philosophical literature. The *Logic* and the *Metaphysic*—the untimely death of the author has deprived us of his work on Practical Philosophy — contain a treatment of the main speculative problems distinguished by acuteness, breadth of knowledge, critical caution, and profound sense of the deep importance of the questions discussed. The historical position of the author gives to these volumes a unique interest. For Lotze might fairly have been described as the one remaining link of connection between the great epoch of systematic speculation in Germany and the more recent age of detailed, scientific research. The character of his mind reflected his historical position. No thinker of any time has more thoroughly combined the speculative instinct of the constructive philosopher with the cautious, practical attitude of the trained scientific investigator. If it be the ideal of the philosopher to work

[1] *Mind*, January 1885.—A critical notice of the English translation of Lotze's *Logic* (Oxford, 1884).

into a harmonious conception those thoughts which are the deepest, most far-reaching, most characteristic of his age, it would be hard to point to any one who has realised the ideal more thoroughly than Lotze.

Lotze's very excellences as a thinker, however, have their consequent defects. His training had given him a profound distrust of constructive metaphysics, a distrust so strong as to be sometimes, if not unintelligent, at least unjust. Yet he is animated by the true speculative impulse, and through the panoply of his cautious reserve the reader of his earlier works could obtain partial glimpses of a comprehensive, well-knit metaphysical idea. The excessive caution of the writer rendered it hard to form any complete notion of his deepest views, and the several parts of his work had, therefore, all the obscurity that belongs to the isolated fragments of an imperfectly known whole. Even in these latest volumes, in which the manner is more scholastic, more regularly expository than was Lotze's wont, something of the same obscurity is to be detected. The various assumptions, distinctions, views, through which the exposition proceeds, wait for justification from the completed whole; even his metaphysic is not fairly before us, since we still want his treatment of the philosophy of religion.

The close interdependence of the several parts of Lotze's work is certainly in no sense an objection to them. On the contrary, Lotze's writing has no more valuable lesson to give the student of philosophy than to teach him the impossibility of abstracting and isolating within its magic sphere. But the continuous feeling of interdependence renders the exposition difficult, and in the *Logic* these difficulties seem to me of a very peculiar and instructive kind.

Before proceeding to give some account of what Lotze embodies under the old title of Logic, I may be allowed to express to the translators and editor of the volume the feelings of gratitude and respect for their labour which I feel assured all students of Logic in this country will share with me. The volume ought to do much for the study of Logic in England, and the translation, if not positively attractive as a piece of English, will at all events not repel or unduly baffle a reader. Lotze's style is never easy to reproduce ; it always has considerable force and eloquence, while in his latest work it is unusually compressed and full of meaning. An elegant version in English could not be forced within the bounds of the original, and the present translation, which, so far as I can judge, is extremely faithful and accurate, suffers only from the inevitable evil of compression. The translators—for the task has been co-operative—have done their work with great ability, and the editor is to be congratulated on the wonderfully uniform style which the whole presents. I have not examined the whole translation minutely, but a selection of certain chapters yielded so small a number of weaknesses, and these of so unimportant a kind, as to confirm the general impression derived from inspection of the whole. The rendering of technical terms has also been very successfully achieved, though due uniformity is not always maintained. The rendering "conception and association" for "Fassung und Verknüpfung" (p. 406) is somewhat misleading.

The *Logic*, as the title specifically indicates, falls into three books or sections. The first of these, Pure Logic, or Thought, is a systematic exposition of the forms in which the logical activity of mind proceeds. The second, Applied Logic, or Investigation, is a much less systematic

treatment of the various ways in which the confused, entangled mass of concrete experience is brought into conformity to the ideal forms of logical connection. The third, Methodology, or Knowledge, is a free discussion of the fundamental problem which emerges from the exposition of the logical activity of mind, the problem of the foundation of knowledge, of the relation between the forms of connection making up the logical ideal and the nature of the real to which experience points. In all three books the reader will find not merely much that will throw light upon logical difficulties, much that will suggest problems of a subtle and profound character, much that may correct hastily adopted theories, but also, to put it generally, a quantity of philosophic thinking so elevated in tone, so sagacious in procedure, as to afford mental exercise of the most improving kind. There is no logician who will not learn much from Lotze's work. On the multitude of interesting detailed questions that appear throughout the volume I do not propose to say anything, and in particular, I must here omit all that concerns the treatment of the commonly called Inductive Logic in the Second Book. The general point of view from which the methods of research are regarded seems to me most excellent; indeed, the only point from which they can be consistently and with profit regarded. And I merely call attention to the weighty and well-expressed note in which Lotze gives his opinion on the logical calculus. With regard to the whole Second Book, however, one must take the advice Lotze offers in his preface, "to regard it as an open market, where the reader may simply pass by the goods he does not want." It is more critical than systematic, and the treatment strengthens the opinion, which one might defend on general grounds, that the methods of scientific investiga-

tion and proof are not capable of being thrown into a rigidly coherent and logical form.

The main interest of the work is to be found in the general idea of the logical activity of thought which inspires the whole, and out of which the characteristics of the familiar logical forms are developed. It is by no means easy to give a complete account of this general idea, and Lotze has himself preferred to allow its features to become apparent in and through the details of the exposition. He deliberately declines to formulate his view as an introduction, either in the way of describing and assigning its exact position to the logical act or in the equivalent way of discussing the place Logic is to hold in a systematic scheme of philosophy. It is of service for the reader of the present work to consult the earlier treatment of Logic which the author put forward under the more immediate influence of the philosophical tendencies of the last generation, and which in essentials is reproduced in the first book of his later treatise. In the introduction to the small but richly suggestive *Logic* of 1843, Lotze discussed two main conceptions of Logic, those of Herbart and Hegel, by comparison with which he was enabled to define the two main features of his own doctrine, features which reappear, though less explicitly put forward, in the later work. On the one hand, while sharing with Herbart the view that the logical forms are to be assigned to the activity of thought, an activity of one specific mode of mental existence, he dissents from the conclusion which Herbart drew, that these logical forms had no validity or significance other than that which belonged to them as specially complicated expressions of the psychological mechanism. From psychology, from the natural history of the mental life, no light, he held, could be thrown on that which is the very essence

of the activity of thought. The same dissent led him to reject the purely formal functions which by Herbart were assigned to the logical connections of ideas. It would do injustice to the meaning of the notion, the judgment, the syllogism, if these were regarded simply as ways in which consistent ideas were put together, or inconsistent ideas held asunder. When we reflect over the real content of the several acts of conceiving, judging, reasoning, we cannot resist the conclusion that their significance is not exhausted by the mere statement of the mechanical conditions under which psychical facts combine or oppose one another. The unique objective reference which is essential to thought is not explicable in the terms ap propriate to the natural history of ideas.

On the other hand, Lotze as strongly dissented from the Hegelian conception of Logic, in which it appeared to him an arbitrary and indefensible identification of thought and reality was the mother-error. Thinking and reality are in essence distinct; however close may be their relations to one another, and however the two may stand as parts of the sum total of being, they are not rashly and as a first step to be identified. The conception of a Logic which should be at once an exhibition of the ways in which thought proceeds and of the essential forms of reality seemed to him confused and misleading. Thought after all is reconstructive in character; as he puts it in his later work, "the human mind does not stand at the centre of things but has a modest position somewhere in the extreme ramifications of reality." The formation of knowledge is a gradual process, and it would be absurd to suppose that there is even a precise correspondence, much less a substantial identity, between the tentative effects of thinking and the modes of real existence.

As in contrast to these opposed conceptions of Logic, Lotze contemplates the middle course which at once recognises the essentially *subjective* or *formal* character of the activity of thought, and at the same time gives full justice to the claim, which thought at all events makes for itself, to be in close relation with reality. "Logic is certainly formal in the sense that it is a theory of the operations of thinking through which the subject works its thought into knowledge; it is as certainly not formal in the sense that these forms of thought are mere psychical facts standing in no express relation to the problem of knowing the real. Logic is certainly not real, in the sense that its forms are elements of the essence of things, but it is real, in so far as these forms depend on elements of the essence of things, in that there lie in the nature of things motives which constrain the thinking spirit to take in the movement of its own thought exactly those forms of apprehending and conjoining objective fact" (*Logik*, 1843, p. 13). In the introduction to the present work, a shorter course is taken to define provisionally the scope of Logic, and the needful explanations appear only in the course of the detailed expositions. Thought as a specific function of the thinking spirit, operating on the material supplied in and through the mere mechanism of the soul, is taken to be a *means* to knowing. As *means* or instrument, it unites characteristics of its own and of that which stands as its correlate, the real to be known. It needs hardly to be said that even a provisional statement, the import of which is so grave, demands the most careful scrutiny. In terms it reads like much that one has been accustomed to meet in the ordinary text-books; the significance which Lotze attaches to it can only be understood when the whole of his work is taken into account, and it

is possible that a critic, with the utmost desire to be fair, may do injustice to a proposition so many-sided and subtle.

The earlier *Logic* was rather more open in its explanations. We read there that thought has its own specific nature, and therefore its forms have a character distinguishing them from the real which under any supposition is contrasted with thought. At the same time, these forms of thought, the acts of thinking, have a colouring due to the nature of the real or to something which is even more closely connected with the real than thought itself. This something is more closely defined as the metaphysical categories, the ultimate assumptions (*Voraussetzungen* is the term used) which reason finds itself compelled to make in regard to the real. Thus thought holds a peculiar and intermediate position. On the one hand, it is opposed to, and distinct from, the mere sequence and combinations of psychical experience, which the natural laws of mind bring forward; in each of its acts and forms there may be traced the special feature of critical reference to a ground or determining condition; and the succession of logical acts may be regarded as a series of steps through which the critical activity of thought proceeds in the attempt to arrange the whole material of experience as a coherent, determined reconstruction of reality. On the other hand, the forms of thought are not identical with the fundamental assumptions of reason in respect to the nature of the real; they are but ways in which the psychical experience, the *Vorstellungen* of the thinking spirit, is brought into conformity with these assumptions (*Logik*, 1843, pp. 18, 23).

The later work is less explicit in its introductory statements, but its procedure manifestly turns upon the same considerations. There is implied throughout, and more fully defined in the detailed discussion, a comprehensive

conception in which no opposition of the real and the spiritual experience of the individual is involved. Thought, as belonging specifically to the individual thinking spirit, may, indeed must, stand in such relations with the real as follow necessarily from their conjoint existence in the sum total of being. But its nature generally, and the characteristics of its particular forms, exhibit, when scrutinised, clear marks of the fundamental difference that obtains between them. The world of thought is the changeless, dateless realm of ideas, in which is no becoming, no development, no existence as fact. Ideas have validity, but not factual reality. They are true, but not existent. And though the animating principle of thought is, in the later work, expressed more cautiously, as the act of "adding to the reproduction or severance of a connection in ideas the accessory notion of a ground for their coherence or non-coherence," yet the exposition of the successive stages through which the principle finds realisation is dominated by the reference to metaphysical assumptions regarding the real. Much of the later work, the Third Book in particular, is but a free, semi-historical defence of the peculiar position assigned to thought.

Without offering for the present any criticism on the ultimate view which is involved in Lotze's method of regarding Logic, I would point out that Lotze finds himself in some difficulty when the question arises how the forms of this logical activity are to be discovered. It is by the notion of *ground*, applied to the conception of the contents of perceptive and representative experience, that is to say, by a rather easy psychological reflection, that he helps himself along, and makes the first all-important step. The mere notion of a ground for the combination or severance of ideas that may have come

about mechanically through the natural laws of mind, implies the consciousness of a distinction between the simply subjective play of thought and the content of those thoughts which seem to enjoy a peculiar species of objective being. No question with regard to validity or truth can possibly arise until the psychological data have undergone the remarkable process to which Lotze, following earlier thinkers, gives the name of Objectification. The *object*, be it remarked, and Lotze is careful to remark, is not to be simply identified with the real; it is for thought, in thought, and by thought. More closely examined, it will be seen that the act of objectifying is at once an act of *positing*, *i.e.*, setting a content before one, distinguishing and comparing. The characters of the posited content, the distinctive marks by which one object is opposed to another, the possibility of comparing, are given, not made by thought. In particular, Lotze thinks, it is a merely fortunate fact, that the world of cognisable stuff affords means of comparing and universalising. That things should present themselves as comparable in degree, number, and extensive quantity, is no necessity of reason, but a fact which thought has thankfully to accept, and without which its most complex acts would be deprived of their essential basis. These elementary processes, through which perceptive and reproductive experience receives form as knowable matter, have left traces of themselves in the fundamental types of grammatical forms; but they are to be viewed as preceding the specifically logical acts, as prerequisites for the critical activity of thought rather than as forming part of it. The main types of the logical act Lotze takes without further discussion. Concept, judgment, and syllogism are ways in which the problem thought sets before itself, that of reducing experience to a systematic

whole in which each combination or separation shall have its ground, is gradually solved. The activity of thought, which finds successively expression in the form of concept, judgment, syllogism, is a higher development of the same function through which the idea of an objective order became possible, and in its development presupposes and rests upon the results of that function. Logical thought, in fact, is to be regarded as a continuous criticism of the crudely formed experience in which ideas of individual facts and vague general representations of similarities are already given, a criticism animated by the single principle that for the conjunction or severance of facts in presentation adequate grounds can and must be disclosed. The concept, the judgment, the syllogism are modes in which *coherence* as opposed to mere conjunction of fact is represented. That it should be possible to obtain a coherent representation is a fortunate accident, depending on an arrangement of the real contents of experience which is not itself a necessary truth; for it is quite conceivable that, even to a spirit animated by the principle of logical connection, experience should offer a dislocated mass of isolated facts which would allow no exercise to its logical function. The same general consideration lends strength to the conclusion, for which other grounds may be adduced, that the forms of logical coherence are not to be rashly viewed as in themselves modes of connection of the real. The relations of universal and particular, of condition and consequence, have no *existence* as facts. They are valid forms of thought, and have a content of their own, but they have not existence as things or even as reciprocal modes of things. What their content is Lotze allows to appear only in the course of the exposition which traces their development; and he leaves much more obscure in the later treatise than

in the earlier *Logik* the answer which might be offered to the question, What determines the varieties of content? For it is not immediately apparent why the merely formal demand for coherence should obtain practical satisfaction in the way of concept, judgment, syllogism, or rather in the assumed relations of which these are the subjective modes of realisation. In the earlier *Logik* the reference to the ultimate metaphysical assumptions supplied a partial key to the difficulty: the concept there appeared as the mode of apprehending the logical substance; judgment as the way in which the relations of universal and particular, of determining rule and determined instance, of conditions and consequences, relations implicit in the content, were subjectively expressed; and syllogism as the mode of representing the systematic whole in which universal and particular, ground and consequence, rule and case are the isolated, abstract parts. In the later work, the scrutiny of the logical forms proceeds with greater freedom, and though it follows the same path, it makes less distinct reference to the underlying metaphysical question.

The essence of the Concept Lotze finds in the peculiar thought which accompanies the presented or represented features, whether mere singulars of perception or generalities formed by the unconscious operation of the discursive activity, the thought of the determining rule or basis. In the process of conceiving, the object, whether a genus or an individual, is viewed as containing in its content the determining rule from which follows the combination of marks making it up. This rule or logical basis is a higher universal than the mere generic image, and it is not formed by the mere omission of marks, which the ordinary logic takes to be the mode of formation of notions. Nor is the relation of rule to determined particulars exhaustively

given in that of whole and parts; there fall therefore to be rejected, as but clumsy adumbrations of the truth, many of the "properties of notions" with which formal logic has delighted itself.

The concept, however, is an imperfect expression of the logical activity. It is itself but a transitory form, midway between the immediate, confused, and incoherent knowledge of the object which is appropriate to perception and the completed cognition in which all that enters into the object would have its value, position, and relations adequately determined. Moreover, it simply places the determining rule alongside the specific features, whether constant or variable, of the objects conceived, and leaves it undecided how, precisely, we are to understand the relation of the universal to its particulars, of the logical substance to its accidents. A more definite attempt to express the nature of the thought-relation between the opposed elements is found in the Judgment. The essential factor in the judgment, the copula, has no other function than to convey the notion which we form of the relation which binds the material contents of experience into conceivable coherent form.

The instructive survey of the forms of judgment, occupying the two chapters of Lotze's First Book, raises many points of interest to the logician, but it is the less necessary to dwell on them since the theory has already been brought before the English reader, partly in Mr Bosanquet's "Logic as the Science of Knowledge," in *Essays in Philosophical Criticism*, partly in Mr F. H. Bradley's *Principles of Logic*. The main object of the survey is to determine the value of the form of judgment as a mode of expressing thought-relation among the contents of ideas (*i.e.*, of psychologically given experience).

It is a kind of criticism but little familiar to logicians; Hegel only, to whom Lotze owes here and throughout much more than he is disposed to acknowledge, has subjected the form of judgment to a similar analysis. Lotze himself is probably much influenced in his grouping of the modes of judgment by the general consideration of the successive grades of knowledge, from its crude indeterminate beginnings to the ideal goal of completed systematic insight; and this consideration supplies a serviceable key to the distribution adopted. The impersonal judgment, the simplest form, while bearing on its surface the mark of the distinction into subject and predicate, which is at once the essence and the perplexity of the judgment, yet leaves the subject entirely undetermined, and so throws little or no light on the kind of relation which in judgment as such is contemplated as uniting subject and predicate. The ordinary categorical judgment, asserting that the subject *is* the predicate, finds itself at once met and baffled by the question, How can one determined and distinct content of thought *be* another? References to the relation of substance and accident, thing and property, do but throw the difficulty forward and convert the simply assertive judgment into a more complex form. In his criticism of the categorical judgment Lotze traces the perplexity mainly to the contradiction between the form of judging and the law of identity; for while the one asserts that S (which is a determinate content) *is* P (another determinate content), thought, proceeding under the law of identity, refuses to contemplate an S which is anything but S, a P which is anything but P. It does not seem to me that the criticism is at all furthered by the appeal to this so-called law of thought; for the solution of the difficulty is to be found, and is found by Lotze, in

showing that the abstract conception of identity has no real application to the case in question. A thought which could proceed by affirming only identity of content is no thought at all. It would have been better simply to insist on the patent fact that the merely assertive judgment, the qualitative or positive judgment, fails to express what it proposes to express, fails to show how a unity is possible between the diverse logical marks of its two factors, the subject and the predicate. That the universal is in some way the particular, and *vice versâ*, that the individual is only a determinate, fully known fact when more than an isolated unit,—all this is implicit in the mere assertion contained in the simple, qualitative judgment; but the form of the judgment is wholly inadequate to the thought which is implied in it. Lotze, however, constantly tends to view the world of thought, of ideas, as that in which the bare, abstract rule of identity is the all-supreme law, and finds in this a peculiarity of thought which effectively distinguishes it from reality.

Escape from the perplexity of the categorical judgment Lotze finds, first, in the transformation which the assertion undergoes when it is quantitatively determined as expressing of all, or some of the subject, the previous predicate. Even here, however, as he insists, the logical form is unequal to the task thought has imposed on it. We find ourselves either in the position of reasserting a blank identity, or reduced to a repetition of the impersonal existential judgment. It is only in the hypothetical judgment, which, by its very form, denies the supreme validity of the abstract rule $A = A$, that the logical form of thinking finds for itself a means of expressing a relation of differences that is at once a unity for thought, and yet not a blank identity. The law of sufficient reason thus stands alongside of and

supplementary to the law of identity ; yet Lotze, true to his preconception of the nature of thought, will have it that the superior and fruitful principle is of but inferior validity, that it is no necessity but a fortunate fact, an assumption "the truth of which is guaranteed by the concentrated impression of all experience." One hardly knows what to make of this, or how to understand the curious property of thought, which, subject in its own nature to an absolute law of a most stringent, but perfectly worthless character, shall yet make an assumption violating its own law and delightedly find that the thinkable world conforms thereto. It is a specimen of Lotze's excessive caution, and perhaps the consequences that would seem to follow from it might be invalidated by some portion of his metaphysical theory of the real. I note it here as bearing on the general view which animates much of the author's polemic against other philosophies.

The final, most developed group of forms of judgment appears as supplying a much-needed addition to the hypothetical. In the latter, there appeared, in the only way which could satisfy thought, the principle that the individual is determined by the universal. The individual *is* not the universal, but it is individual only through conditions or grounds, the interconnection of which is itself represented only by a universal proposition. This interconnection justifies and explains the quantitative determination which appears in the general (or, as we might call it, *abstract*) judgment, in which the predicate P is asserted of S, *i.e.*, of any individual S, because this participates in the general characters of S from which follow as consequence the predicate P. And since it is not P vaguely or generally that follows a vague, indeterminate S, but a particular modification P_1, P_2, or P_3 which follows a modification of

S—S_1, S_2, or S_3—the general judgment finds its complement in the disjunctive. The disjunctive judgment, again, while the completest form in which, by judgment, the unity of subject and predicate can be expressed, has its mark of imperfection in the undetermined choice of alternatives which it offers. It shadows forth the union in thought of subject and predicate; but as it at the same time, while explicitly pointing to a systematic interconnection as the basis of such union, does not contain the interconnection, it finds its supplement in the Syllogism, the mode of thought in which the interconnections of the conditions with that which they bring into a unity of thought is formally expressed.

The serial arrangement of judgments finds its counterpart in the distribution of syllogistic forms; but here the material for discussion is too rich to allow of any thorough examination. It is good that attention should be drawn, as Lotze's chapter cannot fail to draw it, to the precise character of the forms of inference familiar to ordinary logic as the categorical, inductive, and analogical syllogisms, and to the inadequacy of these to discharge all the work which thought has to perform in framing a logically coherent conception of experience. The more complex forms, the quantitative and the classificatory, present problems of a special character; and on the whole one's feeling sometimes is that Lotze's method of transition is arbitrary and artificial. One misses the stringency of a connecting idea from which these varieties would follow, and though one thankfully accepts what Lotze frankly offers regarding the ideal type of completed, systematic cognition, it is not easy to understand its full drift or to perceive its bearing on other portions of his exposition. Without discussing these points, I proceed to notice the

general problem which underlies the whole work, and which is formally though unsystematically discussed in the Third Book, the problem of the relation between the structure of thought and the nature of reality.

Lotze has chosen to develop his views in a semi-historical fashion, criticising various conceptions of value that have come forward in the history of speculation, and defining his position in reference to the aspects of the whole problem so presented. The problem itself may be variously defined as an inquiry into the worth for reality of the forms of thought, or as an investigation of the nature and grounds of certainty in knowledge. The discussion of Scepticism yields two important results, on one of which at least there can be little misunderstanding. That the sceptical view of knowledge implies the principle that reason is capable of attaining truth, criticising its own procedure and determining the worth of grounds, is an argument not less strong because it is familiar and direct. But the radical notion of scepticism, that knowledge, by its very nature as a mediating process, as a connecting link between reality and the thinking spirit, is for ever incapable of attaining to a perfect cognisance of the real, is subtle and many-sided, requiring no small care in handling, if any result of value is to follow. Lotze, so to speak, turns the flank of the sceptical doctrine, by insisting that, after all, knowledge can be nothing but a mediating process, can be nothing but the systematising of what is given in the experience of the thinking spirit, and therefore that any question regarding the *truth* of knowledge must be expressed and discussed in terms that are appropriate to the matter in hand. The abstract nature of things, which presents itself as an element in the sceptical reasoning, is after all a conception, the notion of what the order of things must be;

and the problems which scepticism had formulated in an unintelligible and unanswerable fashion must be restated. It must be asked, what are the characteristics of assured and certain cognition within that world of knowledge in which only the venue lies? One form of answer, a significant and far-reaching thought, Lotze finds in the Platonic theory of a world of Ideas; and the discussion enables him to advance a further position of his own doctrine. The Ideal world may be the home of certain and consistent contents of thought; but the mode of existence of these thoughts, it must be definitely recognised, is not that of real being as things, or even of occurrence as events. They have validity, but not factual existence. Within themselves they may form a concatenated system, from point to point of which the thinking mind may proceed with the certainty of insight; but Plato could not explain, nor does it seem within the scope of the theory to explain, the kind of relation which must be thought between the realm of the eternally valid ideal contents and the reality of things. Even if we allow that in the Ideas is to be found a system of interconnected parts, the Platonic teaching afforded no answer to the deeper question, What are the ultimate elements or principles, and how are they related to the dependent portions of the system? The attempt to answer this new problem Lotze takes to be the gist of the opposed doctrines of modern philosophy in respect to the origin of knowledge, the *a priori* and the empirical. His criticism rests upon a general assumption or metaphysical principle applied to the special case of interaction between the reality of things and the thinking mind (§§ 325ff.). The result of action on the mind is invariably conditioned by the nature of mind itself, and only in the special forms in which that nature expresses itself can the result make its appearance.

Experience, therefore, must always exhibit an *a priori* side, and only in experience can the *a priori* truths, the formulations of what is the essence of the thinking mind in its contributory function, be discovered. The necessity and universality, the self-evidence, characterising these truths, cannot be exhibited as resulting from isolated psychological events; nor is it by the psychological method that insight into the peculiarity of knowing can be obtained.

Throughout these discussions there has been quietly growing in strength the doctrine that the formed product, knowledge, depending as it does on the peculiar nature of the thinking spirit, has a special mode of existence, and that its modes, though doubtless corresponding to elements in the reality of things, are not themselves to be taken as forms of the real. In the fourth chapter this doctrine receives explicit statement and ample illustration. The reality which appears in the formed content of thought is "wholly dissimilar to existence and can only consist in what we have called Validity or in being *predicable of* the Existent." Nay, even the content apprehended in knowledge has the peculiar timeless and changeless mode of being expressed in the Platonic Idea. It is indifferent both to the subjective movement of thought and to the changes of the empirically presented world of perception in which the real seems to be directly given. In this last clause is found the final problem for Lotze's view of thinking. How can we represent any relation between the world of thought-contents (about which we can make only one assertion as necessary for thought itself, viz., that each thought-content is itself and no other) and the changing stream of perceptive experience? Having brought the separations of knowledge to their ultimate form, how are we to understand the junction which appears to take

place? The answer which Lotze makes depends to a large extent on the manner in which the separations have been expressed, but it is fairly given in the three positions signalised by him. First, any assertion within the sphere of knowledge regarding real existence is hypothetical. Secondly, we must assume that the empirical, perceptive world has law in itself. Thirdly, we may obtain, by a scrutiny of perceptive experience itself, certain directly given synthetical truths, on the basis of which thought, discursively proceeding by its own formal rules, may confidently hope to erect a structure of knowledge that shall not only be consistent but in harmony with the laws of fact. On the first and second of these positions I offer no remark; they are simple statements in appearance, but in reality conceal a whole philosophy. The third is the most interesting, for it brings to the front the question which throughout the *Logic* has been in the background: To what extent has Lotze succeeded in justifying his restriction of the functions of thought to the discursive, mediating act of passing from premisses to conclusion?

On this limitation depends the worth of his separation between logical and metaphysical relations, and the validity of his general view of the logical forms. Thought has been placed in opposition to the real, as antithetical to, though corresponding in some way with, it; in the movement of thinking the apprehended content has inevitably found expression in the forms of concept, judgment, syllogism; yet these forms, it is insisted, are in no way relations of the real. Now we find Lotze introducing a new distinction, from which would follow a far more serious restriction of the function of thought, a much more limited notion of the significance of the logical forms. Dealing with knowledge, he reinstates the Kantian doc-

trine of synthetical *a priori* judgments, assigns these, however, in a thoroughly un-Kantian fashion to a perception which does not contain the element of thought, and regards them as self-evident, intuitively grasped data, from which the discursive, elaborative activity of thought may proceed in the construction of a knowledge that adequately represents the real. One would raise little or no objection to what is said regarding the self-evidence of these data, and the necessity in the long run of resting knowledge on self-evidencing judgments; there is here, doubtless, one of those fruitless problems of philosophy which owe their origin and interest to the enormous difficulties of stating simple facts. But one cannot avoid asking, What, then, in their nature, are these primitive data? Are they *judgments*, apprehensions of a connection in real fact, which by inherent light approve themselves as being connections in fact and not merely subjective modes of apprehending? Only the affirmative answer can be yielded by Lotze, though, as was said, he prefers to disguise the answer by using the term "perception." If then we insist that thought has only to deal in the fashion of elaboration with such formed products, we must recognise that, in so using the term "thought," we refer not to that which is responsible for the specifically logical forms of concept, judgment, and syllogism, but to the mode in which thinking as a phase of the concrete psychical life of the individual mind is carried out. We can no longer maintain that to thought are assignable the fundamental arrangements that make up the essence of concept or judgment; by thought can only be meant the special exercise of dealing with material already formed, in the modes which we have called the forms of judgment and concept. That there may be such a discursive exercise may pass without further question; the restriction of the

word "thought" to it has no justification, and it excludes us from regarding the logical forms as in any way expressing the essence of thought.

It is not from one portion only of Lotze's exposition that one would reach the same result. Looking back on his account of the procedure of thought, we find that he starts his survey of the logical activity with the presupposition that material for thought has already received a special handling, has already been formed into definite objects, with distinguishable and comparable marks; and, moreover, in the history of the logical activity, the somewhat vague notion of *ground* has been made to play a very remarkable part. For under its cover there have been quietly introduced into the contents of thought, of the concept, *e.g.*, the all-important features, aspects, of determining and determined, of essence and appearance, of law and modifying circumstance. If one asks,—What, then, are these aspects of the objective content conceived (apprehended in form of a concept)? Are they *thoughts?*—no explicit answer is given. Lotze has been consistent in holding that underneath the logical operation of thought, in the wider sense in which he used that term, there have always lain the metaphysical assumptions; but he has never fairly faced the question whether these are not in their essence thoughts. The difficulty of accommodating the logical activity to these ultimate determinations of objective reality becomes still greater when his narrower conception of thought, as a merely elaborative, mediating process, is to the front. For then one may fairly ask: If knowledge, the whole structure that is due to the operation of discursive thinking, be based on immediate data, which are in form judgments, but which cannot be exhausted by the one law of discursive thought; if the procedure of thought involve throughout

determinations that are not traceable to the activity by which notions, judgments, and syllogisms as modes of elaborating come about ; if, finally, the ideal which thought involves cannot be expressed as the reduction of experience to an analytical whole,—is it not entirely without justification to identify the discursive activity with thought? Are not the accompanying features of this discursive process the genuine characteristics that make up the essence of thought? and is not the discursive process itself but a phase of the concrete life of spirit, the analytical effort of understanding?

It is the opposition between the apparently timeless and changeless content of thought, and the changing, temporally modified content of perceived reality that weighs most with Lotze and causes him to distinguish so sharply Logic from Metaphysic ; yet without diminishing the opposition, one may well doubt the interpretation he has given of it and the conclusion he draws from it. Were one to allow to the fullest extent that the essential aspects of the real, those by which it is intelligible for us, are in their nature "thoughts," and that "thought" is but another name for the system of such thoughts, one would still recognise that, when thought is taken in abstraction from the concrete reality of thinking mind and external reality, it presents the timeless and changeless character of the Platonic Idea. But such result is due to the abstraction that has been made ; it is we who make the opposition, not the nature of things ; and the characteristic of the realm of ideas attaches to it not as an entity in itself, existing in isolation from the real, but as an *abstractum* with no independent, *factual existence*, not even existence of a kind different from that of the real. The world of thought *per se* is truly a "kingdom of shadows" when we compare it with the full reality of concrete existence, but not on this account should we

suppose that thought is somehow divorced from things and has but a formal function in their regard. The perplexities to which such a supposition leads take ample vengeance for the error of mistaking a distinction in thought for a distinction of thought from things.

The minor oppositions which prey upon Lotze seem to connect themselves with the same fundamental consideration. The life of the individual subject contains no perfect picture of the world of being; that there should be much in it which but imperfectly represents the real relations of things—that the human mind should pursue many a devious path and be liable to varied error—is hardly surprising; and one need not on that account suppose an original and impassable separation between reality and knowledge. The consideration of the ways in which our thinking attains to knowledge, of the methods by which crude imperfect experience is transformed, belongs to Psychology rather than to Logic. In sum, what Lotze has marked off as Logic seems to be no independent doctrine, but in part the fragment of a larger whole, the treatment of thought, which is Metaphysic, in part belonging to the history of the development of knowledge in the individual mind, which is Psychology. That Lotze uses Psychology in a narrower sense, that he tends to contrast the psychical mechanism with thought, may be regarded as an expression of the deep-seated disinclination he throughout manifested to contemplate a constructive, systematic philosophy. Justification for the view can be found only in his final metaphysical conception, which, at all events in large part, is accessible in the *Metaphysic*. In a subsequent notice of that work, I propose to consider farther the bearings of his general philosophical position on his treatment of Logic.

III

LOTZE'S METAPHYSIC [1]

In the *Metaphysic* Lotze sums up, with ample historical and critical detail, views which in many other forms he had already laid before the world. If, however, it is to be said that the work contains little absolutely new to the readers of his earlier philosophic productions, it is to be added that only in it is there given the fulness of statement required to make a speculative thought intelligible, and that in this, his latest effort, Lotze's remarkable powers of subtle expression, wide knowledge of the manifold issues raised at every step in speculative construction, and keen sense of the bearings of metaphysical thought on real experience find their amplest scope and bear their richest fruit. No word need be said of the value of the *Metaphysic* as mere discipline. Instructive as Lotze's method always is, whatsoever be the matter to which it is applied, it is here more than ever of significance. The work is a monument of careful, profound, and comprehensive thinking. But it is sufficiently recognised that in Lotze, Germany and the world have lost the last representative of a great philosophical tradition, and that his works must be taken to heart by any student who desires to know how

[1] *Mind*, October 1885.—A critical notice of the English translation of Lotze's *Metaphysic* (Oxford, 1884).

the problems of speculation still connect themselves with the ever increasing mass of special knowledge that the labours of the new generation have accumulated. Our business, at present, is solely with the one closely knit view of things that forms Lotze's metaphysical conception, a view that has given connectedness to his researches in many special fields, that has grown with his growth, and that finds here its most explicit statement.

"Except in rare cases," Lotze has said,[1] "a prolonged philosophical labour is nothing else but the attempt to justify, scientifically, a fundamental view of things which has been adopted in early life." There is certainly a wide difference, in form and in detail of treatment, between the *Metaphysik* of 1879 and the early, little appreciated work with the same title of the year 1841; yet the slightest comparison of their contents enables us to see that the fundamental conception has remained the same, and that the difference arises, in part, from a relinquishment of the method which in the earlier work exhibits clear traces of the then prevailing philosophy in Germany, in part, from the increased fulness of special experience with which the fundamental thought is connected. In both the fundamental conception is that of ethical or teleological idealism —the view of the sum total of things as the unfolding of a plan, of which the significance is spiritual, of which the fixed traits are the general laws of order and connection in nature, and of which the manifestation is the varied realm of things.

The manner in which a thinker arrives at his deepest conviction or is led to give definite form to his thought has always more than mere personal interest. The influences which have weighed with him, and which enter as com-

[1] *Contemporary Review*, January 1880, p. 137.

ponents into his view of things, are not to be regarded as mere external accidents; they form the very substance and in some ways the most significant element of his views. The function of a metaphysical doctrine is to give a unity to experience, and the character of the experience taken in is an essential constituent of the doctrine itself. Lotze has not left to conjecture the task of determining what in his case were the historic circumstances under which his thought was developed. In the interesting account of his early speculative impulses given in the *Streitschriften* (1857), he permits to be seen with the utmost clearness the two great forces which operated on him. These were, briefly, the idealist philosophy of which Hegelianism was the prominent representative, and positive natural science then beginning its extraordinary development in Germany. The opposition between science and the application which Hegelianism had made of idealist philosophy to the details of real experience was in Lotze's mind decisive as to the need of reconstructing, or stating what seemed to him of permanent value in, the great speculative thought of idealism. One may think that he was never quite just to the method of Hegel, that he failed to distinguish what was extraneous to it from its essence, and that his keen sense of the dangers which it had not avoided occasionally carried him too far in the other direction; but it must always be admitted that he undertook the recasting of the idealist conception with an infinitely fuller knowledge than his predecessor of the real experience to which it must be applied, and consequently was enabled to enrich and expand the thought with which at heart he was in entire agreement. It may perhaps prove that the chief value of the *Metaphysic* will consist in its service as introduction, from the more modern point of view, to the bolder, more comprehensive

idealism of Hegel. Some perception of this was doubtless operative in inducing the late Prof. Green to devote so large a portion of his industry to the translation of the present work. Quite a third of the volume is due to him.

To Lotze himself, as one may gather from many detached criticisms and from the general tenour of his whole treatment, there appeared to be one vast difference between his own conception and that of Hegelianism, a difference extending beyond and lying at the root of the manifest divergence of method. In laying out the matter of metaphysic, Lotze adopts on the whole the method of Herbart, and generally is of opinion "that it is only inquiries conducted in the spirit of realism that will satisfy the wishes of idealism." But the superficial difference of arrangement only indicates the deeper opposition in which Lotze stands to the Hegelian method. To him that method seemed to imply the view that the ultimate nature of reality was to be found in and was exhausted by a symmetrical interconnected system of thought-determinations, from which in some way the real proceeded, of which the real was in some way the imperfect manifestation or shadow. Even though at times he is forward to acknowledge that in Hegel are found correctives of such a view, he is yet consistently of opinion that the Hegelian method leads to nothing but a rehabilitation of the Platonic impassable and unworkable division between the realm of absolute thought and the changing, variable, transitory, and relatively non-beënt world of finite fact. To such a conception he stands in irreconcilable opposition and would press as against it the view that found in Aristotle its early exponent. With a statement of the opposition the *Logic* closed, with a restatement of it the *Metaphysic* opens.

It is not, says Lotze, consideration of the pure relations which hold good of the contents of thought that can force on us the metaphysical problem. For of these relations it cannot be said that they are, that they exist, but only that they hold good. Change is predicable of them, only by metaphor. In the world of the thinkable, condition passes not into conditioned, but remains valid with it in eternal, timeless quiescence. The characteristic of the real, its constant change, is no content that can be constructed by thought. Being and non-Being, as thought-contents, stand for ever side by side, each identical with itself and, for thought, irreconcilable with the other. Only an experience that is not pure logical thought brings before us as living fact the changing play of real existence; only in experience that is more than, other than thought, do thought-relations obtain realisation.

"The true reality includes as an inseparable part of itself this varying flow of phenomena in space and time, this course of things that happens. This ceaselessly advancing melody of event—it and nothing else—is the metaphysical place in which the connectedness of the world of Ideas, the multiplicity of its harmonious relations, not only is found by us but alone has its reality." [1]

It would certainly be impossible to exhaust in a single statement the implications of this strongly marked antithesis; only from a connected view of the consequences flowing from it, can one hope to arrive at adequate insight into its significance and worth; and to the exposition of such a view the *Metaphysic* as a whole is devoted. Before turning to the main line of speculation, we may consider for a moment certain preliminary doctrines which concern mainly the method to be pursued, but which likewise

[1] P. 73; *cf.* pp. 78, 84, 135.

connect Lotze's speculation in an intimate fashion with one at least of his predecessors in German philosophy.

It is an opinion which Lotze has repeatedly pressed, nowhere with more explicit statement than in the introduction to the present work, that metaphysic has no absolute method and must be content to start with any given problem of experience in the hope that systematic effort to clear up all the involved difficulties will find satisfaction only in a connected view of all the assumptions that for our thinking render the real conceivable. Assuredly, if by a special method were to be understood something lying outside the body of metaphysical thought itself, by application of which the course of procedure should be from the outset determined, no hesitation could be entertained in accepting his position. Thought has certainly no external standard to appeal to for aid in directing its procedure, nor any external means of testing the progress it has made. Itself is its own light. Even less doubt could be entertained as to the truth of the opinion, and still less value would that opinion have, if it were interpreted as meaning that the ways in which subjective thought gradually attains insight into those assumptions which it must make in order to give consistency and clearness to the conception of real existence, are as various as individual thinkers and occasions of reflection. The movements of the individual's thought assuredly prescribe no laws to the real about which his thought is exercised, and need correspond in no way to those connections at which he ultimately arrives as expressing what he is convinced must be thought, if reality is to have for him consistency. But to maintain that the "forms of apprehending true Being without which we cannot think"[1] are interconnected; that in all its notions

[1] *Metaphysic*, 156.

mind is depicting only the universal features of its own nature,[1]—is, while perfectly compatible with the view that "philosophy is throughout merely an inner movement of the human spirit," [2] to grant all that could be demanded by the most ardent defender of a method peculiar to speculation. Doubtless, it is certain side-thoughts that give colour to Lotze's definite expression of opinion. He has in view pre-eminently the Hegelian dialectical method which appeared to impose on speculative thought one line of progress and which seemed to claim for thought itself possibilities of advance that, as Lotze thinks, can only be furnished by the special problems suggested in variable experience. But here, as throughout the *Logic*, Lotze seems to be entangled in the ambiguities arising from the double sense in which the term Thought is used by him. Thought is, on the one hand, the formal process finding expression in logical relations; on the other hand, it has the fulness of content that attaches to it as systematic representation of the assumptions necessarily made in regard to real existence. In the first sense, thought has certainly no power of self-development; in the second sense, a needless opposition is instituted between real experience and thought,—an opposition that Lotze has ample occasion to withdraw. The developed conception of the nature of real experience must contain an explanation of the remarkable union in thought of the apparently irreconcilable difference between the objective content and the subjective existence of thinking as in the individual spirit. It is the peculiar excellence of Lotze's view that it allows us to put those different sides in a harmonious relation to one another; but such a result is altogether incompatible with the strong antagonism manifested to the methodical prin-

[1] *Mikrokosmus*, iii. 539. [2] *Metaphysic*, 165.

ciple that in thought itself lies the spring of its own movement.

In one minor contention, Lotze finds himself in agreement with the view he otherwise opposes. Metaphysic cannot rest on or be preceded by a Theory of Knowledge. A criticism of knowledge is possible only on the basis of an underlying Metaphysic. In words at least, this opinion seems to stand in "unheard-of opposition to the tendency of our time." There may be thinkers who have understood the Kantian idea of theory of knowledge to be equivalent to "a psychological analysis of cognition," and who have deemed it possible to analyse knowledge in general on the basis of some hastily assumed psychological facts. Doubtless, too, the demand to consider how knowledge is possible before proceeding with satisfaction to concrete problems, may readily degenerate into an empty formula, worth little more than the old request to determine the eating powers of a chimæra *in vacuo*. Doubtless, finally, it becomes a weariness to have critics of the Critical Philosophy continually charged with misapprehensions of its genuine meaning. But it seems, nevertheless, worth while to say that from Lotze's reproach Kant himself must be taken as exempt. With all its appearance of psychological method, the "Transcendental Logic" has no other problem than that set by Lotze to Metaphysic, to determine the significance and connection of the propositions in regard to reality which "we believe ourselves to have no option but to maintain." The categories and other "playthings of philosophy" are not for Kant mere forms of subjective thinking; and that they should be put in most intimate relation to knowledge as constituting its essential structure is but to say that the connection of the real is only for mind. To examine the possibility of knowledge is not for Kant to give a psycho-

logical analysis of the constituents of knowing or a history of how it comes about, but to determine the ultimate meaning of the notions, propositions, or assumptions which are involved in the simple fact of experience. And, on the whole, whatever opinion may be formed of the limitations inherent in the Kantian method, one would be inclined to say, regarding the character of much post-Kantian metaphysic, that there is still need of Kant's strenuous warning that the significance of the ultimate forms of intelligibility can only be determined by viewing them in relation to thought. We may trace even in Lotze, though in him the due corrective is not wanting, a tendency towards treatment that closely resembles the pre-Critical method of Leibniz; and, in all historical reference to Kant, it should be borne in mind that the pre-Critical method was not foreign to him, that, *e.g.*, the conception of interaction as implying change of inner state among the individual members of a system was a point from which Kant started, not a new idea of scope wider than the limits of the Critical method.[1]

It is probable that to the influence of Herbart is to be ascribed Lotze's tendency to treat the Kantian and Hegelian method as inevitably falling into subjective idealism; for subjective idealism is the enemy against which Herbart directs his strongest attacks and has most sedulously to defend his own position. Lotze is certainly no Herbartian, and is right in declaring that, on the points on which his views approximate to those of his more immediate predecessor, both drew from a common source, namely, Leibniz;

[1] It is of interest to compare Kant's first metaphysical handling of the problem of real relations, in the *Principiorum prim. cognitionis metaph. nova Dilucidatio* (1755), with that of Lotze, *Metaphysic*, bk. i, cc. 4, 5.

but in the external form of his method he imitates Herbart, and throughout the *Metaphysic* the conceptions which he bears most constantly in mind are those of Herbart. Nor is this unnatural; for Herbart's metaphysic has a prevailing air of scientific realism. Herbart's treatment of such fundamental conceptions as those of change, substance, and cause comes near to the exacter determination of ordinary thought that characterises the best scientific method, and in some departments at least, as in psychology, the results are of the most excellent kind. It is possible at the same time—and for the view one would claim the support of Lotze—that the best results of the Herbartian treatment in the concrete spheres of research are independent of the peculiarities of the Herbartian metaphysic and can be combined with a conception of the whole nature of reality differing widely from that of Herbart.

The treatment of the first fundamental notions of Ontology—being, quality, reality, and change (Book I, cc. 1-4)—is directed so consistently against Herbart's doctrines that some notice of the latter seems needful in order to seize the full meaning of the result to which Lotze slowly works up. To Herbart, the task of Ontology was the elaboration or clearing up of the notions involved in or connected with the indirect affirmation of real being given in sense-perception. Philosophy, in his view, has to start from a foundation supplied to it, has to accept something as given, and has then to endeavour so to determine the nature of the involved thoughts as to bring them into conformity with the absolutely valid laws of our thinking—the laws of identity and non-contradiction. Experience in its simplest phase, sensuous perception, no doubt offers us much that is incoherent, self-contradictory, and standing in need of elaboration; but of one lesson it

teaches there can be no doubt: it teaches that something is. Even if all the content of experience be characterised as phenomenal, even if we admit that sensuous perception as qualitative state of a percipient can in no way be identified with the quality—the *what*—of the real corresponding to it, yet the fact of perception, the order and method of perceived content—order and method which are as much given as the content ordered—force upon us the thought of an independent real from which they follow. The course of philosophy is thus arc-like: it starts from the groundwork of experience, is driven onwards and upwards to the conception of a reality that is not in experience, and has to descend again in explanation of experience with the wealth of notions that it has gathered in its progress. But the course of thought is never other than subjective. The contradictions inherent in the crude notions of experience drive us to supplement these notions and to form more complicated conceptions which allow thought without self-contradiction to deal with experience; but the supplementing remains a work of thought merely and indicates nothing in the nature of the real itself. The related elements of a complex conception, the ways in which we consider now this, now that, aspect of the real, remain external to the real itself. Objective we may call them, if we understand by that only—valid for all finite intelligences to whom experience comes as a compound effect of the relations in which intelligence, itself a real, stands to other realities; but they are subjective in the deeper sense, that in themselves they express only movements of thought, *i.e.*, transitory states of a subject over against and inclusive of whom the realm of reality stands in unchanged, stable, motionless self-identity.

The motives which animate a great thought are always

so numerous, and the value which one assigns to it depends so much on its applicability to special problems, that a brief statement can convey but little of its deepest significance. It must suffice here to draw attention to the main outlines of the conception which Herbart, following the older Eleatic and Atomist thinkers, placed in opposition to the dominant philosophy of his time. For him as for the Eleatics, the real was characterised by changelessness of being, simplicity, and permanence ; but with the Atomists, he admitted multiplicity of being. The real he found in the absolutely simple, positive, specifically qualified essences, to the notion of which he thought we were driven in order to make consistent our empirical conceptions. The real existence which seems to be given in sense-perception, the more complicated experiences of things with qualities, of change, of interaction, seemed to him conceivable, if viewed as resulting from, or expressing, certain relations of the ultimate realities that lie beyond experience. That the real is, we affirm as a necessary supplement to experience ; what the real is, we do not know by direct perception, but we are driven to conceive of such real after the fashion of a simple quality, such as might be given in presentation. Having so determined the real, we have then to discover how, in conformity with its notion, to explain the most general conceptions of experience. the forms of our empirical knowledge, *i.e.*, Space, Matter, Movement, and Time, and finally Experience itself, as a series of states in a subject, which yet claims to have a peculiar relation with the real.

Apart from its general speculative importance, Herbart's view derives much of its interest from the apparent correspondence it maintains with the popular, common-sense, everyday conception of things. It represents one line along which thought, starting from the ordinary practical

mode of regarding the world, is compelled to proceed. We naturally and easily take as initial position the practical conception of ourselves as real, existent subjects, variously affected in consequence of the varying relations in which we stand to other real existences. The *position* or affirmation of reality in any presented content, offers itself naturally as the correlative of self-position, conviction of our own real being. An easy reflection, which doubtless conceals under its simple guise a highly complicated movement of thought, leads us to admit that the nature, the characteristic features of the posited real, cannot be identical with the qualitative content of the experience with which the *position* is connected; but we are just as ready to maintain that nevertheless the *fact* of our experience, the occurring of any presented content, is sufficient warrant for the position in question. We readily allow that the apparent unity of the things, to the conception of which we have accustomed ourselves, need not be absolute; scientific analysis renders familiar the view of apparently simple but really complex effects arising from the combination of simple antecedents; and, still carrying with us our conviction of reality as the substratum, we are willing to regard the varied field of experience as phenomenal result of unknown and unknowable real elements. Our realism easily transfigures itself. And equally simple reflections enable our first conception of things to yield certain provisional characteristics of these real elements. The difference between the fulness of direct sensuous perception and the unfulfilled content of a wish or purpose would be sufficient of itself, were it not confirmed by many similar distinctions, to lead us to the important discrimination between subjective and objective reality and to determine the latter as relatively independent, permanent,

self-existent. Now of these and like reflections the metaphysic of Herbart contains the precise and explicit formulation. Like them, it starts from the conviction of the real nature of the affected subject; admits that the qualitative content of affections must be viewed as dependent on the subject; maintains, however, that the fact of the occurrence of these affections, and the independent ways in which they come and go, are sufficient to justify the retention of our first, primitive belief in reality; and endeavours to give an exact formulation of the results to which reflection on the form of experience must lead. One might ask, with regard to it, whether these results do follow as supposed; or one might ask whether the results themselves satisfy the demands of thought from which they are assumed to have followed. The latter is the line of inquiry followed by Lotze, and, although something may be lost by adopting it to the exclusion of the other, we may here consider the substance of the criticism he offers.

Does the conception of the existent as made up of a multiplicity of ultimate reals, each characterised by the marks of positive quality, simplicity, independence, enable us to understand the world of experience? Does not the attempt to make this conception conform to the demands of thought itself lead, even in Herbart's hands, to such a transformation of it as practically to destroy its peculiar features? One might say here that the Herbartian conception of the real corresponds point for point to his conception of the mental life, and most of the difficulties of the one are the difficulties of the other. There the varied flow of inner experience is viewed as the continuously altering result of the mutual interference of the several isolated *Vorstellungen*, each of which *is* and remains permanently what it is. But it was impossible for Herbart

to avoid just such an alteration of his psychological doctrine as appears to be called for in regard of the metaphysic,—an alteration, as one might briefly express it, from the mechanical conception of a multiplicity of isolated units to the conception of a real altering spiritual life.

Consider, in the first place, the bare demands made in the notion of Being. Sensuous experience may appear to involve the positing, the affirming of a single, isolated, unit of reality; but it does so only if we allow ourselves to make a wholly false abstraction in its regard. The sensuous experience which might be conceived to have as its correlate the posited unit of reality would not be sense-perception as an act of knowing, but an abstract idea of the hypothetical simplest element in the psychical life. Nowhere do we find a sensuous experience which involves the position of an unrelated, absolute, real. The common-sense view of things goes no further than to the assertion that reality somehow *is* and is made known to us through sense-experience, nor does it ever involve the thought of real being as consisting in the absolute unrelated position of real elements. What determines for any element of existence its being is the relations in which it stands. The thought of pure being is, if we look to its genesis, an abstraction; if we look to its content, a mere abstract. Nor does it avail to insist that relations imply related parts, the being of which must therefore be allowed as independent of the relations. Common-sense here is in complete accord with speculative thought. Being is a connected system of which the parts taken in isolation *are* not. And if we allow ourselves to revel in abstractions, to hypostatise, as Herbart does, unconsciously perhaps but not unfrequently, and to speak of these isolated elements as existences which *enter into* relations with one another, we suffer the fate

inevitable on all abstract procedure: we are presented with incompatible features, with a disjunction that is to be united but refuses all combination. The relatedness of being is not an internal accident of being itself; elements which have not relatedness in themselves cannot enter into relations in general.

Herbart, however, had the courage of his opinions. He insisted that relatedness is an external accident of the reals, that the world of true being remains for ever intact, unaffected by change, and that the ground of change, phenomenal change, is not to be sought in any mark of the real itself. But careful analysis of his procedure makes clear to us that an important modification is introduced, and necessarily introduced, into the conception of the real. Phenomenal change we accept as an experience, which, though offering insuperable difficulties to thought, is nevertheless given; and the notions involved in it must somehow be capable of explanation. Herbart's explanation appears at first sight to be merely the more exact interpretation, the translation into metaphysical terms, of the criticism which scientific analysis of the common-sense view easily yields. One readily allows that the phenomenal thing, the complex of attributes united in our apprehension as one thing, exists not as it is at first conceived; that the multiplicity of attributes points to a multiplicity of real antecedents; and that the unity indicates no featureless substance, but merely the identity of one and the same real in varied relations with others. Any given real, A, may be placed in relation to any number of other reals; out of each such relation will emerge, for a spectator who is not directly cognisant of the reals but himself stands in relations, the apprehension that we call a quality or attribute; and popular thought readily accommodates itself

to the admission that the unity of the empirical complex is provisional. Change, in like manner, must be interpreted as the phenomenal indication of the coming and going of real relations. But, having gone so far with Herbart, one is compelled to ask, not only whether more has been done than to express in a vivid way the primary conviction that experience rests upon reality, but whether the new interpretation is compatible with the metaphysical conception of the nature of the real. If the real is to be conceived as a multiplicity of simple unchangeable elements, capable of entering into relations with one another, what, for the reals themselves, is the significance of these relations? It is in vain that Herbart endeavours to retain the two opposing sides of his doctrine. He cannot at once claim for the real elements their characteristic features of unchanging self-identity and find in their varying relations the ground of phenomenal change, substantiality and causality. Even if it be granted that, for a subject that stands as one real among others, varying relations will take form, will find schematic representation in the ways familiar to perceptive experience as alteration, determined sequence of states and of events,—it remains impossible to interpret the nature of these real relations in conformity with the Eleatic view of Being. Herbart himself has another mode of interpretation. Change is not in any one real; but it may follow from the reciprocal relations of the reals. For these, he thinks, may be legitimately viewed as opposing one another, and as preserving each its own identical being in the midst of opposition. Each real maintains itself against disturbance or suppression from other reals, and in this self-maintenance is to be found the secret of real action. In any one real there may thus be a series of states or conditions, expressing the ways in which it preserves itself over against the other

reals that oppose themselves to it. The elaborate criticism which Lotze offers of this new conception leads directly to the heart of his own view, and it may be briefly summed up as follows. If we preserve our first conceptions of the reals as simple, self-identical posited contents, then opposition or any kind of relation between the reals can only be thought as subjective mode of relating on the part of a conceiving mind, from which there follows no explanation at all of real action. If we desire to explain real action, and so allow that relation of the reals is more than subjective result of comparison—is something in the real world itself—then we must resign our conception of the world of reals as a multiplicity of independent, distinct, self-identical units. It is not that we require to supplement in any way our conception of real action in order to attain this result; we simply require to make plain to ourselves the implication of the thought. He who posits real relatedness must at the same time allow that the independence of the related elements ceases, that they become no longer changeless, permanent centres of relation, but merely the relatively fixed points in one continuously altering system. The unity and self-identity which we demand of the real must be transferred from the hypothetical monads to the whole in which they are members.

Of the substantial soundness of Lotze's criticism no reasonable doubt can be entertained. The same line of thought, though with differing form of expression, lies implicit in Kant and in Hegel. For Kant is practically expressing the same view when he insists that, so long as we attempt to conceive objects as merely logical units, interconnection of them is impossible. Objective relation is only possible in an experience connected together in the unity of a thinking subject. The very gist of Hegel's

philosophy lies in the antithesis to Herbart's conception of the real nature of things as an aggregate of simple, unchanging points of relation. Lotze has his own quarrel with both Kant and Hegel, but it is animated by quite special considerations and is of small importance as compared with his agreement with them on this cardinal point.[1]

That the real cannot be conceived after the fashion of perceived object, but only in the systematic order peculiar to the content of a notion, is a conclusion from which one may rapidly proceed to a statement of Lotze's ultimate metaphysical view. Retaining as he does the opposition between our subjective thinking and reality, Lotze is careful to maintain that the various thoughts by which we gradually correct our first conception of things are not to be taken as themselves constituting the nature of reality, but as the ways in which we construct for ourselves a view that satisfies the problems reflection brings before us. The being of things we cannot reconstruct; we must accept the given fact of existence, and resign the inherently hopeless task of accounting for the fact that anything exists. But since we have seen that the ultimate nature of things is not to be sought in an aggregate of simple qualities, that the *position* characteristic of things is not to be taken as distinct from their content, that change and relatedness belong to the very essence of reality,—we are driven to conclude that the being of things is not a doom thrust upon them from without, is not the result of a union between qualities and an underlying substratum of reality, is not a law external to the cases of its manifestation, but

[1] One of the briefest statements of Lotze on the problem of the nature of real relatedness will be found in the *Grundzüge der Religionsphilosophie*, §§ 14 ff.

can be interpreted only as the ability to act and suffer, only as the position which the so-called thing occupies in a systematic whole of interconnected and mutually determining reality. And, if we push further our attempt to make clear the notion of this interconnected system, we are forced to the conclusion that the absolute independence of things is an erroneous exaggeration of a truth correct enough in its proper place, and that relatedness of things is conceivable only if the so-called things be viewed as members of one fundamental unit or substance, or Absolute.

Philosophy has sought out many forms of expression for the notion to which Lotze, by his own path, thus attains; and, on the whole, criticism of them does but force upon one the extraordinary difficulties which attend any attempt to sum up in one brief formula the content of the most complex thought with which we interpret experience. It is hardly possible to avoid the abstractness attaching to the employment of any one notion as explanatory of a wide and varied complex of facts, and frequent injustice must be done in the criticism of other solutions by overlooking the inevitable narrowness of the notions through which definite formulation of a view has been sought.

It is by closer scrutiny of the conception of real interaction among so-called things that Lotze advances to a more complete determination of the characteristics necessarily involved in the thought of the all-embracing reality. If relations obtain among things, if the thought of reciprocal determination is to be taken as more than a subjective term of comparison, these relations cannot remain external to the things themselves, but must indicate changes, reciprocally determining, in the inner states, the modes of existing, of the things themselves. That this should be so, is but a special application of the thought which Lotze throughout

insists upon, the thought of reality as no mechanical compound of matter and form, but as itself the living, developing whole. If, further — recalling the conclusion reached, that the independence of things is but an abstraction of our own thinking, and that the possibility of a reciprocal determination of inner states exists in the unity of the real in which all such states are—we ask what mode of existence we can ascribe to the absolute real attained, we have simply to consider what insight we possess into the possibility of a union, a real union, of manifold states in one being. With Leibniz, Lotze answers, there is given one, and there is only given one, instance of such *unitas in varietate:* spirit or mind. We can only conceive of the absolute, the uniting bond of the varied states of so-called things, after the fashion of spirit or mind. Reality, in the full sense, is only for the unit conscious of its own unity in multiplicity. Doubtless such a conclusion raises many special problems, but it furnishes the sole comprehensive answer to those more abstract inquiries that fall within the scope of Ontology.

It is not possible to do more than indicate in the briefest fashion the nature of the discussions which fall under the remaining rubrics of the *Metaphysic*. Generally, the purport of these may be said to be the attempt to show that the forms of experience, more or less complex, which at first glance appear more particularly to connect themselves with the realist view of the universe, are susceptible of as exact and more profound interpretation on the idealist hypothesis. For example, the reality of space, which is a necessity for the realist view in one fashion or another, whether in the crude fashion of naturalist speculation or in the finer metaphysic of Herbart, may retain all its significance when interpreted as signifying merely that in the

nature of the inter-related activities of so-called things are involved features which are capable of apprehension by us only in the fashion of the space-schema. Space is thus a mode of intuition, or rather a mode of the intuited: for its relations appear in the content of the apprehension, not in the mode of apprehending. Time, in like manner, must be conceived not as something external to the real life of the one absolute being, but as the mode in which, in the experience of the finite spirit, the orderly connection and continuous development of reality is apprehended. There is in the chapter of Time, and in the treatment of the same point in the *Grundzüge der Metaphysik* and *Grundzüge der Religionsphilosophie*, much matter that would deserve careful and detailed handling. Of special interest, in my opinion, is the manner in which Lotze has to connect with the metaphysical difficulties of the notion of Time the psychological problems that arise from consideration of memory and of the limit of simultaneous consciousness.

The further the Cosmological speculations are pushed, the more nearly do they approach a question familiar to British philosophy. When space has been interpreted as a mode of intuition, when a reading in terms of conscious experience has been attempted in regard to the fundamental characteristics of matter, when the independent existence of so-called things has been denied,—the question naturally arises, Are things and their relations more than the orderly experience of finite minds? Is there no existence in the universe of reality save the conscious experience of minds? Unfortunately the answer to such a question has too often been attempted with the aid of notions altogether inadequate to it, and with an almost total forgetfulness of the true metaphysical significance of the question. One cannot but feel sympathy with Herbart in his indignation at subjective

idealism ; for if ever there was an empty formula, parading itself as full of meaning and value, it is the fancied philosophical truth that since all that we know is in self-conscious experience, our varied presentations and representations compose the total of reality.

It is a prejudice, though an inveterate prejudice, that the spiritual, inner life has no other function than to reflect in fashion of a mirror a real world, complete in existence and function independently of mind. The contrast that obtains under any metaphysical conception between the larger life of the whole and the inner modes of being and acting which make up the individual's self-consciousness, is too readily interpreted as a contrast between two radically unlike phases of being ; and the simple truth that the being of even the hypothetically assumed *thing* is not identical with the phase of individual thought in which it is directly apprehended or indirectly represented, is taken to mean that the being of things is complete and absolute apart from the spiritual realm of self-conscious mind, that existence breaks up into two unlike spheres. But we rob the thing in no way of its *reality* for all the practical ends of life (and these for the most part determine our conception of reality) when, on purely ontological grounds, we deny to it self-existence and independence, and interpret it as but a form of the process through which the absolute, itself spiritual in nature, takes expression. Just as little need we hesitate to say, on grounds more psychological, that things are not in the fulness of their being save when forming, with and in relation to the inner life of self-conscious minds, parts of that to which we can assign reality of existence. Things are not modes of apprehension of finite minds ; the external world is no spectral illusion or projection of individual minds ; but the existence of things, of an external world, is

not a summed up, completed fact, apart from the existence and thought of finite minds. We must interpret the world as one whole, not as an incoherent juxtaposition of opposed parts. A world in which there is an inner life, directly and immediately given, cannot be interpreted after the realist fashion, whether in its crude or more refined form. And here, one may be permitted to say, lies the oversight in the quasi-metaphysical schemes that have been based on modern scientific conceptions. We need not only the most exact and complete history of the ways in which the real course of things has proceeded, but to interpret the whole in the light, not of what is lowest, least independent in it, but of what is highest, most complete in being.

It is but a step from this conclusion to a new series of thoughts which Lotze, wrongly one may think, does not specifically include under Metaphysic. In accordance with his stubborn antagonism to the term Thought, Lotze, insisting that the function of thought is but formal, finds in the concrete life of spiritual activity, as contrasted with the cold, colourless mechanism of thought, the vehicle through which the real existence of things is brought down to us. It is Experience in the largest sense of that vague term—real apprehension, feeling, and acting—that gives us a place among things and indeed makes these things to be for us. And in this concrete life, there are features, feelings and estimates of worth, of which the pure contemplation of the world by thought could give us no inkling, but which force upon us a new and larger interpretation of the sum total of things. In fact, Lotze arrives by his own path at the point long before reached by Kant in the *Kritik der Urtheilskraft*, and like Kant, though with more modern phraseology, offers a final reading of the universe in terms of ethical idealism. Things are, not

merely in order to be the parts of a mechanism, but as the instruments whereby the ultimate good is wrought out; our knowledge has objective value because it brings before us no mere purposeless play of phenomena, but gives us a world the interconnections of which are subordinated to the final and sole reality in it, the Good. Of the manner in which Lotze handles the difficult problems raised by these thoughts, nothing need here be said, for Lotze has himself with his usual caution excluded the treatment from Metaphysic proper. The ninth book of the *Mikrokosmus* and the *Grundzüge der Religionsphilosophie* contain his most matured expressions.

A notice like the present can convey but a very imperfect idea of so complicated a work as the *Metaphysic*. There exists in the English language no other work at all resembling it, and one may hope for good results from its appearance among us. Very sincere gratitude is due to the translators, who seem to have executed their difficult task with the most conscientious care and with a high measure of success. Our stubborn tongue does not lend itself readily to the expression of subtle thoughts, and at times the sentences of the translation have a Teutonic awkwardness, but on the whole the book appears to me by far the most successful of the unfortunately few translations we possess of German philosophical works. The editor, Mr Bosanquet, is to be congratulated on the successful termination of what must have been difficult and delicate work.

IV

MR BRADLEY'S LOGIC[1]

MR BRADLEY'S work comes very opportunely. It is a characteristic feature of much of the best philosophical work of the present time that it consists in the main of revision of fundamental principles. A period of eminently constructive work lies behind us, and it is not impossible that much of the present stir may signify only the process of coming to understand what has been done. But it is true now, as at all times, that a philosophic view is only to be attained from one's own position, and that a comprehensive philosophic method can only become living and fruitful if it connects itself and is penetrated with the thoughts of the present. There is no simple tradition in philosophy, and, if a method or system is accepted, the ground must lie in the fact that its leading idea has proved itself capable of expanding so as to cover the new aspects under which the perennial problems have appeared.

It is but natural that the process of scrutinising first principles and testing them by application to the great body of questions that has always formed the material of philosophy should appear, when regarded from a somewhat external point of view, like a chaos of disjointed and

[1] *Mind*, January 1884.—A critical notice of *The Principles of Logic*, by F. H. Bradley (London, 1883).

mutually opposing tendencies. Certainly the present state of the study of Logic has this appearance. If one takes only the representative English writings in that department, one cannot but be struck by the apparently boundless diversity of view in regard to every matter of fundamental importance. Province and method of the science, auxiliary principles with which to make the approach to logical doctrines, theory of the doctrines themselves—in no one of these points is there anything like an established view, a common basis. It is not many years since one might have said that, on the whole, putting aside the merely historical teaching of what is erroneously entitled the Aristotelian logic, English writing on the subject might have been fairly distributed under two main heads : on the one hand, a purely formal logic, basing itself, though perhaps unwittingly, on an extremely imperfect psychology, supporting itself by appeal to the high authority of Kant, and claiming to have effected, if at a cost of rejecting the most interesting questions, a purification and scientific limitation of the sphere of logical discussions ; on the other hand, a general theory of knowledge, likewise involving much disputable psychology, but rightly claiming to represent more truthfully than its rival the actual process of thought as exemplified in scientific work, and so extending its boundaries as to be able only by arbitrary refusal to reject the deeper questions inevitably raised by any discussion of the nature of knowledge. In a multiplicity of ways, complete dissolution of the one, and partial dissolution of the other of these apparently compact doctrines has been brought about, and now the state of Logic is like that of Israel under the Judges : every man doeth that which is right in his own eyes. Even when a writer is aware that fundamental difficulties lie in the way of the view upon which he is

proceeding, he claims the right to act as did the prudent divine, to look the difficulty in the face and pass on. The reader is perplexed by continual references to a distinction between logical and non-logical, a very phantom on which he can lay no hold, but which in some strange fashion appears to regulate his author's proceedings and to extricate him when any formidable danger is at hand. Each *Logic* presents some new arrangement of material, some fresh classification of notions, judgments, and the like, some novel way of getting over an old familiar stile, but it is rare indeed that in any such treatment a really vigorous effort is made to show the grounds for all that is advanced and so allow the reader to form what our German friends call an objective opinion.

Affairs are no better, perhaps to some they may appear worse, among the German logicians. In that speculative domain, *Logics* swarm as bees in spring-time. Many of them, it is true, do not aspire to more than merely academic honours; they are text-books from which the reader may learn a little, and by which he may to some extent be disciplined in thinking. But, these apart, there have been supplied by German writers within the last few years quite half a dozen treatises of a much higher order, comprehensive, elaborate, based on principles of some sort, and each giving an altogether individual and new reading of the fundamental logical processes. He who endeavours to extract from the *Logics* of Lotze, Sigwart, Bergmann, Schuppe—even if he does not extend consideration to the somewhat earlier but yet living works of Ulrici, Trendelenburg, and Ueberweg—a systematic representation of logical doctrines, has before him a task to which the labours of Hercules were simple. He will doubtless be able to discover that in some fashion all are treating of the same fact, whether it

be described as thought or knowledge ; more of agreement than this he will hardly find. In the mass and in detail, each treatment pursues its own way, and supports itself by a more or less explicit reference to something else, whether psychology, or metaphysics, or common-sense, or philology, or anthropology, or what not. Classifications and distinctions are introduced, on grounds sufficient or insufficent but invariably diverse, and thus, in so cardinal a matter as the distribution of the forms of judgment, we are presented not only with such rearrangement of the comparatively familiar types as indicates a novel point of view, but with a variety of new forms, substantial and accidental, descriptive and explanatory, substitutive, co-ordinative, subsumptive, &c., the number of which seems practically indefinite, and to be determined merely by the extent to which current modes of speech have been taken into consideration by the writer. The limits of the subject as a whole are equally indeterminate. Inquiries rejected by some are admitted and treated as fundamental by others ; the ground of rejection or inclusion appearing really to be whether or not the writer has handled elsewhere or proposes to handle elsewhere these problems.

Chaotic as are the phenomena on which an opinion with respect to Logic has to be based, the general character of that opinion can hardly be matter of doubt. This turmoil of conflicting views is a most hopeful sign. For it indicates that we are beginning to form a logic which shall in some way represent the laws and methods of our thought, and that the stage of preparation, the attainment of some more precise conception of what is truly the function of thought, has been reached. We have, one would trust for ever, given up the conception of thought as a mere formal activity, dissevered from the body of that which makes up

our knowledge, indifferent to content, and obeying only the law of one and two, of Identity and Difference. Probably no theory of thought has ever been so empty and so destructive of genuine thinking as the Formal Logic, miscalled Kantian, which endeavoured to proceed upon that basis. Really, that logic, taken strictly, must resolve its whole contents into one simple practical maxim : " Let thinking be consistent with itself." Whatsoever else it contains must come from without, in the shape of psychological propositions regarding the elements of thinking, or metaphysical assumptions regarding the conditions of what is thought. But, though we are perhaps able to see how futile is the purely formal logic of thought, there is sufficient evidence supplied by our current logical works that we have not yet succeeded in marking off logical discussions proper from general psychology or grammar or merely popular thinking. Even where the view is taken that Logic is a real theory of knowledge, an attempt to unfold completely the processes and laws by which knowledge is formed and systematised, there is an almost constant confusion between the psychological and the logical analysis of knowledge. Knowledge being confessedly a subjective affair, a matter of mind, it is instantly assumed that the same predicates which apply to facts of mind regarded as such are to be found and are operative as logical peculiarities. The doctrine of notions, *e.g.*, tends to become a mere receptacle for psychological discussions regarding the modes of forming ideas, their kinds and the properties of each class—subjects no doubt of psychological interest, but not truly involved in the logical inquiry. The doctrine of judgment is confused by having imported into it a whole mass of disputable matter regarding the nature of belief, or conviction of reality; and theories of the judgment, which are almost as numerous as

treatises on Logic, turn for the most part on psychological differences. Only a vigorous effort to determine generally the fundamental characteristics of the points of view from which Logic and Psychology respectively contemplate knowledge, or a detailed criticism of the several doctrines with this general aim in view, can aid us in coming to a really fruitful decision as to the function and scope of logical science.

It is as making a large and powerful contribution towards this end that one hails Mr Bradley's work. He does not profess to work out in systematic completeness a doctrine of logic; but, partly by polemical discussion of views, partly by presentation of results based on a more sound and penetrating analysis of the function of thought, he has not only cleared the way of much that for long has been an almost insuperable obstacle, but has also drawn attention to the real nature of logical problems and raised the discussion of them to a platform indefinitely higher than that occupied by our current logical thinking. His work is not one of which it is easy to give any brief and connected account, and the difficulties of a reviewer are somewhat aggravated by the peculiarities of the author's style and method. In a matter of this kind, no doubt, much must depend on the individual's turn of thinking; but I should fear that some part of the good effect that ought to be produced by Mr Bradley's work will not be realised because the reader will fail to seize the leading idea of the whole. The discussion grows in complexity as it is developed, and partial views are taken up into and superseded by the more comprehensive solutions. But there is throughout implied a method of regarding the whole business of thought that is not brought with sufficient clearness to the front, and the point of many isolated treatments may in consequence be missed. Mr Bradley has chosen his own way, and has

worked towards a theory of judgment and inference, by taking up, comparing, setting against the current teaching, and carefully sifting empirically selected types of judgments and reasonings. Such a method has its advantages for teaching purposes, but it is apt to mislead unless the underlying principles which guide the whole discussion are clearly discerned. Mr Bradley hardly brings these forward into sufficient prominence, though he might well have done so, and it requires a long-breathed reader to accompany him through his devious course. Perhaps this one complaint may connect itself with the remark in Mr Bradley's preface that critics of different tendencies may object that the treatment contains too much or too little metaphysics. I cannot think that Logic as a whole is in any way independent of Metaphysics, though I fully admit that, as metaphysics covers a multitude of problems, it is not necessary that into every section all the rest should be dragged; nor do I imagine that the occasional distinctions drawn by Mr Bradley between logic and metaphysics indicate a contrary opinion. What is alone of importance is the ultimate view of reality and thought, which is common to all such problems and binds logic and metaphysics into a unity. I do not find that Mr Bradley makes the view on which he proceeds clear, and it appears to me that the force of many of the discussions, in particular that with which the book closes, on the validity of inference, is weakened by the want of some definite statement.

Mr Bradley begins his inquiry with the treatment of the central problem of logical theory, the significance or import of the Judgment, and to this the whole of Book I is devoted. Book II begins the discussion of Inference, and in its first part, expounds certain general types and principles of reasoning as substitute for the rejected syllo-

gism. The second part of the book is entirely critical, and is devoted to an examination of the doctrine of Association with its natural sequels, the idea of reasoning from particulars and the Inductive methods, and to an appreciative though hostile review of Jevons's Equational Logic. Book III resumes the discussion of Inference, brings forward in the first part the main processes in which the essential characteristics of inference are to be detected, and endeavours to reduce these to their most general expression, and in the second part handles the ultimate problem, foreshadowed throughout all the discussion, of the relation between logical truth and real, objective connection. The work, it will be seen, is at once comprehensive and has a certain systematic idea in it. Apart from the main inquiry, moreover, it abounds in good thinking, and no reader can fail to derive benefit from the acuteness with which isolated questions of psychological or metaphysical interest are handled. In truth, one is somewhat embarrassed with Mr Bradley's riches, and would feel inclined at times to wish that he had pruned his work more closely. A little dissatisfaction is inevitable when a promising problem is only hinted at, even though the glance given be one of undeniable acuteness. The frequency with which Mr Bradley is compelled to make brief excursions into psychology and what he chooses to call metaphysics, and the importance of the relative matters, lead us to desire that he had substituted for much occasional disquisition one serious and careful statement of the way in which he regards thought as subject of psychological, logical, and metaphysical treatment respectively. Such a statement is called for, not only in order to illumine his own results, but also as furnishing some guiding thread to his criticism of other views.

Naturally, it is in the theory of Judgment that a logician's fundamental point of view comes to the front, and the judgment is here handled with great elaboration and much subtlety. Experience must have taught every one who has made the attempt how difficult it is to express in other language the results a thinker has come to on a question of the greatest complexity; and I can hardly hope to have succeeded in adequately apprehending all that enters into Mr Bradley's view of what constitutes a judgment. So far, however, as I can determine, his opinions would be somewhat as follows. Judgment is clearly a mental function, that is to say, it can only be understood as part of the complex in which thought and reality stand as opposed to, yet depending on, one another. But as a mental function, judgment is not to be taken as having the characteristics of a mental fact. However valuable may be the results of a psychological investigation of judgment as a fact in the mental life, however much light may be indirectly thrown on its logical nature by tracing the history and conditions of its appearance, the judgment as an element of knowledge, as the very mode of apprehending the real, is not simply a psychical fact, nor can the logical theory of judgment admit any determination of either idea or reality as these are treated for psychology. The constituents of the judgment, idea and reality, are equally necessary and require special definition. The idea is not the mental fact, taken as such; it is part of the general content of the real as apprehended, separated off, fixed and used as a sign or symbol. Relatively to the real, which is substantival, the idea is adjectival. It is known as not itself the real, but it has significance, meaning; and this meaning is definitely referred to the real. In any judgment the idea or ideal content is connected with,

attached to, the real, and the new relation resulting is perceived not to be made by the act of judging but to be independent thereof.

This highly general description of judgment can hardly be quite intelligible until it has received filling-in from contrast with opposed views and from consideration of the new features which complex experience introduces into it. But the view deserves warm recognition as an attempt to see through the thick veils of current doctrine and to seize the very essence of the act of judging. I do not know how far Mr Bradley's illustrations and explanations of the term *idea* will throw light upon the meaning in which it is to be employed; for there is danger, despite his precautions, that the matter will be viewed psychologically; and this danger is perhaps aggravated by the attempt to give a genetic account of the way in which we may suppose judgment to have come about in a developing intelligence. There is a correlative danger, attaching to the term *reality*, on which a word will be said later. What one would desire to insist more strongly upon, is the essential conjunction of the two factors, reality and idea, in judgment, and the impossibility of taking these apart from one another. Popular thinking and psychological considerations tend constantly towards a contrast which is fatal to any theory of thought; and the employment of the term *idea* at all emphasises the contrast in a most hurtful manner.

Provisional acceptance of the general description of judgment enables Mr Bradley to deal summarily with certain definitions of judgment, which err either by abstractly isolating the factors of the judgment or by accepting part for the whole. Such, *e.g.*, are all definitions of judgment as comparison of ideas, under which fall the current explanations of judging as referring to a class,

as asserting identity of subject and predicate, or definitions which are merely adequate or inadequate psychological theorems. The criticisms here are to the point and felicitously expressed.

The discussion of the more abstruse questions regarding the judgment is led up to from the familiar doctrine that, in a categorical judgment, existence of either subject or predicate is not asserted. "All S is P" by no means forces the assertor to the admission that either S or P exists. S and P are merely ideal contents, and the judgment is no more than the statement that these are so connected that if the one, then the other as qualified by the first. Difficulties of this kind have recently begun to find their way into our current logical discussions, not without most hopeful results.[1] Clearly, if a solution is to come at all, and is to affect our distribution of logical judgments, it must be arrived at by a more profound consideration of the reference to reality that has appeared as a constituent of the judgment. Mr Bradley advances to the task by contrasting in a general way the characteristics of reality and truth. The real is individual, self-existent, substantival. Truth on the other hand, as having to do with the idea, has no one of these characteristics. At first sight, then, it would seem that all truth is hypothetical merely, that it expresses only well or ill founded connections of ideal contents in our minds. To come closer to the problem, there is introduced a provisional classification of categorical assertions, into (1) analytic judgments of sense, in which the given is merely

[1] See, *e.g.*, Mr Venn in *Symbolic Logic*, and Mr A. Sidgwick's very thoughtful treatment of Abstract and Concrete Propositions in *Fallacies*.

described by one of its parts, (2) synthetic judgments of sense, in which the real of sense-perception, involved in the assertion, transcends what is immediately given, (3) those in which the real referred to is not a fact of perception. Scrutiny of these yields as result the important principles, that the real, even when taken in the sense of the real in perception, is not identical with its momentary appearance in perception, said momentary appearance, indeed, being an incognisable atom when taken in isolation; that the real, taken in more or less limited fashion, is ideally determined and directly referred to in the analytic judgments; that the real is indirectly referred to in synthetic judgments and is in them taken to be a continuous identity underlying the momentary phenomenal appearance. All such judgments are singular and appear to be categorical, to imply assertion of the real and of its elements as appearing in the judgment. Universal abstract judgments and hypotheticals, on the other hand, appear to assert merely necessary connection of ideal content, and therefore point only to that in the real which is the ground of the consequence necessarily following. In the judgment, "If S, then P," we only assert that if the real be qualified as S, then it will present also the qualification P; we do not assert that the real is either S or P.

But to rest content with such a view is to do grave injustice to the function of thought and to take an extremely imperfect and abstract aspect of the real as the whole of its significance. In the concluding sections of his second chapter Mr Bradley advances towards a completer doctrine of the kinds of propositions. He has little trouble in showing that synthetic judgments of sense, which transcend the given, proceed on a principle not distinguishable

from that which characterises the hypothetical, while analytic judgments of sense, though professing to give the real, do so only by a process of mutilation that is concealed by ordinary language but is fatal to their claims as absolutely and simply true. The terms of which the singular analytic judgment consists are universal, are wholly inadequate to express the concrete reality that is assumed. Such judgments are in fact the poorest and most abstract, giving the least expression of reality. Like all other judgments they do refer to reality, but they refer in the least definite, most hypothetical fashion. Abstract judgments, though on one side to be described as hypothetical, for they do not assert the existence of their elements, are on another side categorical, for they do imply a quality of the real and express the nature of the real as the realm of law, of systematic connection of facts.

The negative judgment (ch. iii), Mr Bradley regards as resting essentially on the recognised exclusion by the real of a suggested ideal determination. It implies, therefore, in all cases a recognised ground of exclusion, a positive element, though the nature of this ground need not be the same in all cases of negation. It is with satisfaction that one sees the blank form Not-A assigned to its true place (pp. 118-9, *cf.* pp. 147-8), but the whole tenor of this chapter and occasional special statements (pp. 109, 116) tend rather strongly towards the purely subjective interpretation of judgment which is the gulf always yawning beside the logician. The disjunctive judgment (ch. iv) is shown to involve a categorical assertion regarding the disparate members of a whole predicate, a hypothetical determination of the subject in reference to these disparates, and a general assumption or inference regarding the totality of the sphere which is divided.

Chapter v, on the Principles of Identity, Contradiction, Excluded Middle, and Double Negation, is perhaps one of the least satisfactory, not because there is much in it from which one would dissent, but because it does not seem possible to discuss with any profit these principles from the point of view which the author is taking. If we regard judging as part of the subjective process of knowing, these principles have only relative significance. In their abstract and general form they can only be handled in what we think Mr Bradley would call metaphysics. Not much is to be gained by treating truth in isolation, and so rendering the Law of Identity, *e.g.*, as that it merely expresses the abstractness of truth (p. 133), and, similarly, the dialectic method requires not to be compared with Contradiction and Excluded Middle when these are taken from the same point of view.

Chapters vi and vii, on Quantity and Modality, raise a multiplicity of questions. Want of space prevents my doing more than call attention to the excellent treatment of the general basis of probable reasoning which is given in ch. vii; to a general statement of the chapter I shall have occasion later to refer. The treatment of quantity raises two problems—first, that of extension and intension, second, that of the meaning to be assigned to universal and particular. In respect to both, the ordinary logic has accepted partial doctrines either from uncritical experience or from psychology, and Mr Bradley's review, though probably not final, does good service in pointing out the unspeakable confusion that prevails regarding them. In his treatment Mr Bradley is led to fall foul of two familiar doctrines, the one that some names are non-connotative, the other that extensions and intensions vary inversely. There is no doubt that the word "connotation"

has crept into logic without being able to yield a very satisfactory account of itself, and the modern use of it, dating doubtless from Mill's *Logic*, is entirely at variance with its earlier acceptation. From some points of view the distinction indicated by it becomes comparatively worthless; but I do not know that there is not a positive advantage in having a word which shall indicate the specific property of a sign when used to designate a class. The matter is mainly grammatical, not logical; but I do not think that it is at all necessary to identify connotation with *signification*, and so, because all signs have signification, to assert that they all have connotation. In like manner the doctrine of inverse relation between extension and intension has doubtless been applied in a wholly absurd and senseless fashion; but I imagine that in the long run the meaning of the doctrine will be found to rest on the peculiar relation between genus and species, and to result from taking abstractly a truth which would have a different expression when all the elements are taken together.

The current doctrine regarding extension and comprehension in judgments, if indeed there is any one doctrine on the subject, is sufficiently confused; and it seems hardly worth while to contrast with it in detail a new reading of these distinctions. If the definition of judgment adopted by Mr Bradley be carried out, and the subject be taken not as the grammatical subject which appears in the verbal statement, but as the ultimate reality, then it is easily seen that, as implying ideal content, the judgment may be read in comprehension, while, as referring to the real, it may be read in extension. The distinction is hardly worth retaining. So the current doctrine of the quantity of propositions can be shown to rest on little more than grammatical peculiarities of verbal expressions, and critics have had

little trouble in collecting empirical expressions which by no ingenuity can find reasonable explanation within that doctrine. Even in recent treatises the attempt to remodel the current teaching on quantity has hardly gone further than the introduction of distinctions between law and instance, abstract universality and concrete particularity, which are far from exhausting the matter. It is interesting to note the manner in which Mr Bradley is driven to what he has called specially metaphysical determinations in order to effect an explanation of quantitative differences. Ideal content he appears to take as in itself universal: it has no quantitative determinations in it; but such content is only one element in the judgment. The real which is the correlative factor is shown to contain in itself the mutually determining features of abstract universality and abstract particularity, and to have therefore in its individual character the aspects of the universal—the identity of differences,—and of the particular—the differences of this identity. The real is thus concrete, and may appear as either concrete universal, or concrete particular, or the individual which is the truth of both. And the ideal content is at once seen to be an abstract, just as worthless as the assumed atomic, ultimate, undetermined real. This is a most important result; it affects the whole doctrine of judgment, and enables us to see that the judgment is nothing but the way in which the elements of the only reality, the thing which is known or has its notion, are held apart from one another so that their mutual implication becomes apparent. If we please we may express this in a subjective fashion, and think of the process as that in which the real is determined by some idea in us; but such a translation is dangerous, as in all probability leading to an opposition of real and ideal which can have no place in the judgment

per se. We may ask, and the question appears at the close of Mr Bradley's work, what signifies this fundamental form of consciousness, the reference of knowledge to reality? how comes it that in our judging and reasoning we should at once seem to be merely reproducing in ideal fashion a reality that is completely given, and at the same time supplying intelligible shape and substance for a matter that is relatively abstract and undetermined? But we must be careful not to prejudge the answer by introducing into our very notion of the judgment a reference to the abstract subject. That in the mental development of the concrete spirit judgment does come about through the opposition of perceptions, representations, and the like, is a fact with which Logic does not require to concern itself.

In his Second Book Mr Bradley passes to the consideration of Reasoning. Part of the book is occupied with a polemical review of the theory of knowledge that has sprung from the psychological doctrine of Association of Ideas. With respect to this part I can only say here that I think Mr Bradley most successful in his criticism, and that the chapter on Association is a valuable contribution towards a sounder psychology. The chapter on the Inductive Methods sums up, from a higher point of view than has generally been taken, the difficulties which most serious critics of Mill's *Logic* have felt in their regard. I am glad to find that Mr Bradley takes a view which I have more than once expressed, that a false prominence has been attached to these methods as parts of the general doctrine of Inference supported by Mill. The chapter on Equational Logic is acute and ingenious. I imagine that the ground of Mr Bradley's strongly expressed approval of a doctrine deviating so widely from his own is the conviction that the Equational Logic avoids at all events the numberless

psychological abstractions of the ordinary and empirical logic, and that it does make a vigorous effort to describe the modes in which we deal with the real in knowledge.

The Third Book continues the analysis of Reasoning and leads up to the final logical problems. I am well aware that no brief abstract can give a fair idea of the merits of the prolonged treatment of inference which is contained in these books, and that any attempt to compress the author's results simply casts into the shade the most interesting and instructive part of his work. The nature and forms of inference are handled with unwearied patience; such parts of the current logic as specially concern themselves with the foundation of the process are sifted and examined with minute and sometimes exhausting care; incidental problems receive brief and generally luminous discussion. A brief statement, moreover, must do injustice to the individuality of Mr Bradley's method, which is such as, I think, will cause trouble to many of his readers. Mr Bradley begins with a general view of inference which is later on altered in accordance with the distinctions arrived at in the course of the discussion. Regarding inferences as a process in which a new truth is reached from something accepted, he more formally translates these popular terms into the statement that an inference is an ideal construction resulting in the perception of a new connection. A conclusion, as such, is not something merely given; it is reached. The accepted data are not isolated elements standing apart from the conclusion. In the process they are looked at, placed together, put in a relation to one another, ideally experimented on, and the result is a new relation perceived or the perception of a new relation. This general statement and the empirical examples which cohere with it lead to a very vehement polemic against our ancient friend the

Syllogism. Mr Bradley's grounds of quarrel are varied. He denies that schemata, general forms of valid inference, can be laid down: we can indicate only the general heads of relation within which by ideal experiment a new relation can be reached; we can indicate only the general principle which guarantees the possibility inferring under each category. Let the category, for example, be that of synthesis in space, as when I say "A is to the right of B, and B is to the right of C"; then there can be indicated generally what kind of conclusion can be drawn and the principle of connection on which the ideal experiment proceeds. The actual conclusion is perceived, seen to follow, and is not drawn by any rigid syllogistic process. Again, the syllogism has insisted on a major premiss, has viewed inference as being procedure by subsumption of a less under a more general. Not only is this hard to reconcile with the notion of inference as giving a new relation; not only is it quite out of keeping with the kinds of reasoning that occur constantly in experience, *e.g.*, mathematical construction and the like; but it altogether misconceives the relation between a principle of reasoning and the reasoning itself. A principle is not a general model or axiom by reference to which we reason; reasoning is a function which embodies a principle, is its living exponent. The two are not to be severed as they are in syllogism.

Dismissing, thus, the syllogism—and I think that, as that form is commonly expressed, we should agree in doing so, though perhaps with milder language—Mr Bradley notes the main principles which underlie his types of reasoning. These are identity within the elements of the ideal experiment and universality of one premiss—different aspects of the same. This identity, as previously in the case of the so-called law of thought, is taken with a genuine meta-

physical significance, but here with a possibly misleading stress laid on the subjective side. The ground of reasoning, it is said, is the assumed real identity of that which is identical in ideal content; by which one might well understand the empty identity of the syllogistic form, that the middle term shall be the *same*. But we cannot take "ideal content" in this abstract sense, or regard it as in any way conditioned by the subjective process of thinking. It is significance or meaning, the real viewed in its essential character for thought as the union of universal and particular. The notion of correspondence between ideal content and reality is ambiguous and can only lead to a quite contradictory result. On this ground I am altogether disinclined to accept, in lieu of the syllogism, as necessarily arising out of judgment, the subjective processes of construction and the like on which Mr Bradley expands himself. Nor do I follow him in his criticism of the syllogistic form as fallaciously attempting to draw a conclusion which must be left to the private judgment of the individual thinker. No doubt, the ordinary mode of expressing the syllogism—through concrete instances—is deeply in fault; no doubt, also, the class-idea on which the syllogism is made to turn is a veritable abstraction which cannot be regarded as the life of reasoning. But the concrete inferences, which are supposed to show the incompetence of syllogistic form and to be products of ideal experimentations, do in themselves involve the fundamental categories of universal, particular, and individual, of whose connection the syllogism is but the form. That from these categories taken *in abstracto* inferences in concrete matter can be drawn is of course false; but it does not seem at all needful, in order to rescue the syllogism from oblivion, to insist that concrete thinking involves nothing more than these abstract categories. To

reject the syllogism and to lay all stress upon these processes—construction, comparison, abstraction, and the like—is to tend towards a purely subjective reading of thought, and to interpret the real as a kind of unknowable, foreign to thought, and only assumed, on grounds good or bad, to conform in some way to it.

With much care and elaboration Mr Bradley in his Third Book works out the forms in which as it seems to him inference really proceeds, finally bringing them under the two rubrics Analysis and Synthesis, with indication of a third process (perhaps System) at the root of which lies the ultimate idea of the real as concrete individuality, unfolding itself in its peculiar forms into all the richness of existence. Such third process, which perhaps connects itself with the class of judgments not expressly handled, those in which the subject is non-phenomenal reality, is but hinted at, and the problem raised by it is treated in the concluding chapters from a narrower point of view. Briefly, the question there raised is that of the validity of inference—a many-sided question, the mere formulation of which in its true terms is philosophy at large. Mr Bradley approaches it from various sides, discussing the relation of ground of knowledge to ground of existence, of formal validity to real truth, and finally of knowing as a whole to fact known. The difficulty, which no one will be more ready to acknowledge than Mr Bradley himself, of coming to a perfect understanding with regard to the significance of the terms employed in so abstruse a discussion, and the dependence of any meaning on a more or less developed philosophic view, render it impossible to do more than remark on one or two of the aspects of the treatment here given. Mr Bradley refers in his discussion to Lotze; and most readers of the *Logik* will remember the

stringent criticism to which the claims of logical forms to real validity are subjected. But, at the same time, it ought not to be forgotten that such criticism rested on a metaphysical basis, on a theory of the soul and of psychical life, which rendered it absolutely necessary to regard logical forms as being mere products of the psychological mechanism *under certain presuppositions*. The whole difficulty which rises out of the very term "truth" was simply cast back into the undetermined field of assumptions; for by these assumptions only can "reality" have a significance for us. To follow in this track is to play with the term "reality" and to be driven in the long run to the *caput mortuum* of the "thing-in-itself." I do not imagine that Mr Bradley takes this track,—there is much in his book that so would be incomprehensible; but he undoubtedly speaks as if the nature of thought were such as to render reality altogether foreign to it, and sometimes treats phenomenal reality, momentary appearance, as if it had supreme worth and supplied a touchstone for the validity of reasoning. Knowledge is subjective, unquestionably, and it is not reality, simply because it is knowledge; but it is not on that account to be regarded either as a complex, accidental growth in the individual spirit, or as doomed for ever to face its own insoluble problem. If we seriously treat knowledge as one of the modes of thought in and for which reality has any significance, we may come to see why there is continuously present therein the opposition of knowing and being, which, hastily interpreted and mixed with foreign considerations, might lead to an abstract severance of the two. Possibly, also, those minor queries, such as that relating to the cause and the reason in knowledge, would yield to an investigation of the true significance of the relative categories employed.

I am in doubt to what extent these remarks do injustice to Mr Bradley's point of view; but the definition he has given of judgment, his interpretation of the modal categories, his development of the forms of inference, his frequent excursions into the psychology of knowledge, and his final discussion of reality, seem to me to imply a view hardly in keeping with the general tenor of the book, and possibly, if worked out, destructive to much that appears there. However that may be, there is this to be said, that from few books of recent philosophy is there more to be learned than from the present work. No reader can fail to learn much or to be stimulated in the best way by the abundant criticism that is bestowed upon logical and psychological doctrines; there is none who cannot benefit by the remarkable patience, circumspection, and acuteness with which the author handles each logical question. That a work should be calculated to raise the whole standard of discussion in its subject is perhaps the highest praise that can be given; in my judgment such praise can be unreservedly accorded to Mr Bradley's treatment of the Principles of Logic.

PREFACE

In the pages which follow will be found the outlines of the logic of a set of categorical forms which are not Aristotle's own. It is only the fragment of a general theory, but the content of all the chapters of the old logic, which are commonly regarded as essential, except that one which deals with the calculus of classes, will be found included. In the first appendix the relation of these new forms to the traditional ones has been pointed out in detail.

I have at least one debt, which calls for a definite acknowledgement. It is to my friend and teacher, Mr. Edgar A. Singer, Jr., that I owe what training I have had in the science. He has never failed, through hints thrown out in conversation, to correct my misapprehensions. But my indebtedness is more specific than this. I have so far employed his own method, a method developed in his academic lectures, that I could scarcely have ventured upon the publication of these outlines of a theory without his express permission.

H. B. S.

TABLE OF CONTENTS

CHAPTER I

PAGES

§1-3. The fundamental properties of the categorical forms. Exercises ..... 1 – 9

CHAPTER II

§4-8. The relationships of "better" and "worse." Deduction of the moods of immediate inference and of the syllogism by rule. Exercises... 10–17

CHAPTER III

§9-14. The relationships of "better" and "worse" defined. Symbolic deduction of the moods of immediate inference and of the syllogism. Exercises 18–27

CHAPTER IV

§15. The general solution of the sorites. Exercises... 28–34

APPENDIX I

On the simplification of categorical expression and the reduction of the syllogistic figures..... 35–44

APPENDIX II

Historical note on De Morgan's new propositional forms 45–48

UNIV. OF
CALIFORNIA

CHAPTER I

§1. In 1846 Sir William Hamilton published the prospectus of an essay on a "New Analytic of Logical Forms,"* which revived the question as to whether or not the quantity of the predicate of the categorical forms should be stated explicitly. The chief difficulties of his system result from the ambiguity of the meaning of *some*, from the impossibility of making every form of categorical expression simply convertible, and from the seemingly curious effort to establish an order of *better* and *worse* between the relations connecting subject and predicate. Four of Hamilton's eight forms are redundant. The four that remain will be represented here by the letters, α, β, γ, ϵ.

Accordingly let

α_{ab} = all a is all b,
β_{ab} = some a is some b,
γ_{ab} = all a is some b,
ϵ_{ab} = no a is b.

Here *some*, the *some* expressed explicitly in β and γ, means *some at least, not all.* This meaning of the word is established unambiguously by the properties of the forms. In addition to these abbreviations we will employ the notation:

$x_{ab} = x_{ab}$ (is true),
$x'_{ab} = x_{ab}$ (is false),
$x_{ab} \cdot y_{ab} = x_{ab}$ (is true) and y_{ab} (is true),
$x_{ab} + y_{ab} = x_{ab}$ (is true) or y_{ab} (is true),
$x_{ab} \angle y_{ab} = x_{ab}$ (is true) implies y_{ab} (is true),
$(x_{ab} \angle y_{ab})' = x_{ab}$ (is true) does not imply y_{ab} (is true).

---

*Lectures on Logic, ed. by Mansel and Veitch, Boston, Gould and Lincoln, 1863.

UNIV. OF CALIFORNIA

§2. The implications, which are given below, express the chief characteristics of the forms. The theorems follow by the principle of the denial of the consequent, which may be written in the two forms:

$$(x \angle y') \angle (y \angle x') \text{ and } (x' \angle y)' \angle (y' \angle x)'.$$

*Postulates:**

$\alpha_{ab} \angle \beta'_{ab}$	$\beta_{ab} \angle \gamma'_{ab}$	$(\alpha'_{ab} \angle \beta_{ab})'$	$(\beta'_{ab} \angle \gamma_{ab})'$
$\alpha_{ab} \angle \gamma'_{ab}$	$\beta_{ab} \angle \epsilon'_{ab}$	$(\alpha'_{ab} \angle \gamma_{ab})'$	$(\beta'_{ab} \angle \epsilon_{ab})'$
$\alpha_{ab} \angle \epsilon'_{ab}$	$\gamma_{ab} \angle \epsilon'_{ab}$	$(\alpha'_{ab} \angle \epsilon_{ab})'$	$(\gamma'_{ab} \angle \epsilon_{ab})'$
$\gamma_{ab} \angle \gamma'_{ba}$		$(\gamma'_{ab} \angle \gamma_{ba})'$	

Theorems:

$\epsilon_{ab} \angle \alpha'_{ab}$	$\gamma_{ab} \angle \alpha'_{ab}$	$(\epsilon'_{ab} \angle \alpha_{ab})'$	$(\gamma'_{ab} \angle \alpha_{ab})'$
$\epsilon_{ab} \angle \beta'_{ab}$	$\gamma_{ab} \angle \beta'_{ab}$	$(\epsilon'_{ab} \angle \beta_{ab})'$	$(\gamma'_{ab} \angle \beta_{ab})'$
$\epsilon_{ab} \angle \gamma'_{ab}$	$\beta_{ab} \angle \alpha'_{ab}$	$(\epsilon'_{ab} \angle \gamma_{ab})'$	$(\beta'_{ab} \angle \alpha_{ab})'$

Let us postulate in addition that:

$\alpha_{ab} \angle (\alpha'_{ab})'$	$(\alpha'_{ab})' \angle \alpha_{ab}$
$\beta_{ab} \angle (\beta'_{ab})'$	$(\beta'_{ab})' \angle \beta_{ab}$
$\gamma_{ab} \angle (\gamma'_{ab})'$	$(\gamma'_{ab})' \angle \gamma_{ab}$
$\epsilon_{ab} \angle (\epsilon'_{ab})'$	$(\epsilon'_{ab})' \angle \epsilon_{ab}$

Then, if $k_{ab} \neq w_{ab}$ and if k_{ab} and w_{ab} represent only the unprimed letters, $\alpha_{ab}, \beta_{ab}, \gamma_{ab}, \epsilon_{ab}$, a complete induction of the propositions given above yields the general result:

$$k_{ab} \angle (k'_{ab})', \quad (k'_{ab})' \angle k_{ab}, \qquad \text{I}$$

$$k_{ab} \angle w'_{ab}, \quad (w'_{ab} \angle k_{ab})', \qquad \text{II}$$

---

*These assumptions are in accord with those of the common logic, but no longer hold when the terms are allowed to take on the limiting values 0 and 1; for γ_{01} and ϵ_{01} are both true propositions. The assumptions $(\gamma_{ab} \angle \epsilon'_{ab})'$ and $(\epsilon_{ab} \angle \gamma'_{ab})'$ will be characteristic of a more general logic, which will include the classical logic as a special case. (See the concluding remarks of chapter III.)

and by denial of the consequent,

$$(x \angle y) \angle (y' \angle x'),$$
$$(x \angle y)' \angle (y' \angle x')',$$

it follows that:

$$(k'_{ab})' \angle w'_{ab}, \quad (w'_{ab} \angle (k'_{ab})')'. \qquad \text{III}$$

If now we postulate:

$$(\alpha_{ab} \angle \alpha'_{ab})' \qquad (\alpha'_{ab} \angle \alpha_{ab})'$$
$$(\beta_{ab} \angle \beta'_{ab})' \qquad (\beta'_{ab} \angle \beta_{ab})'$$
$$(\gamma_{ab} \angle \gamma'_{ab})' \qquad (\gamma'_{ab} \angle \gamma_{ab})'$$
$$(\epsilon_{ab} \angle \epsilon'_{ab})' \qquad (\epsilon'_{ab} \angle \epsilon_{ab})'$$

and, consequently,

$$(k_{ab} \angle k'_{ab})', \quad (k'_{ab} \angle k_{ab})',$$

it will follow by*

$$(x \angle y)\ (x \angle z)' \angle (y \angle z)',$$
$$(x \angle z)'\ (y \angle z) \angle (x \angle y)',$$

that $(k_{ab} \angle (w'_{ab})')', \quad ((w'_{ab})' \angle k_{ab})'.$ IV

Finally if we assume

$$\alpha_{ab} \angle \alpha_{ba}, \quad \beta_{ab} \angle \beta_{ba}, \quad \gamma_{ab} \angle \gamma_{ab}, \quad \epsilon_{ab} \angle \epsilon_{ba},$$

it will follow, by

$$(x \angle y)\ (y \angle z) \angle (x \angle z) \text{ and } (x \angle y) \angle (y' \angle x'),$$

that

$$k_{ab} \angle k_{ab}, \quad k'_{ab} \angle k'_{ab}. \qquad \text{I}'$$

Definitions.

If $x_{ab} \angle y'_{ab}$ and $y'_{ab} \angle x_{ab}$, x_{ab} is said to be *contradictory* to y_{ab}. By I, k_{ab} is contradictory to k'_{ab} and, by I′, k'_{ab} is contradictory to k_{ab}.

---

*These are obtained from $(x \angle y)\ (y \angle z) \angle (x \angle z)$ by $(xy \angle z) \angle (xz' \angle y')$ and $xy \angle yx$.

If $x_{ab} \angle y'_{ab}$ and $(y'_{ab} \angle x_{ab})'$, x_{ab} is said to be *contrary* to y_{ab}. By II, k_{ab} is contrary to w_{ab}, and conversely, since k_{ab} and w_{ab} are interchangeable.

If $(x_{ab} \angle y'_{ab})'$ and $y'_{ab} \angle x_{ab}$, x_{ab} is said to be *subcontrary* to y_{ab}. By III, k'_{ab} and w'_{ab} are subcontrary pairs.

If $(x_{ab} \angle y'_{ab})'$ and $(y'_{ab} \angle x_{ab})'$, x_{ab} is said to be *subalternate* to y_{ab}. By IV, k'_{ab} and w_{ab} are subalternate pairs.

§3. Having classified the categorical forms under these heads, it remains to differentiate them by means of their formal properties. If we assume as valid,

$$\alpha'_{aa} \angle \alpha_{aa}, \quad \epsilon'_{a\bar{a}} \angle \epsilon_{a\bar{a}}, \quad (\alpha_{aa} \angle \alpha'_{aa})', \quad (\epsilon_{a\bar{a}} \angle \epsilon'_{a\bar{a}})',$$

where $\bar{a}$ represents the class contradictory to a, (non-a), the other propositions given below may be derived.*

$$\begin{array}{llll} \alpha'_{aa} \angle \alpha_{aa} & (\alpha_{aa} \angle \alpha'_{aa})' & \alpha_{a\bar{a}} \angle \alpha'_{a\bar{a}} & (\alpha'_{a\bar{a}} \angle \alpha_{a\bar{a}})' \\ \beta_{aa} \angle \beta'_{aa} & (\beta'_{aa} \angle \beta_{aa})' & \beta_{a\bar{a}} \angle \beta'_{a\bar{a}} & (\beta'_{a\bar{a}} \angle \beta_{a\bar{a}})' \\ \gamma_{aa} \angle \gamma'_{aa} & (\gamma'_{aa} \angle \gamma_{aa})' & \gamma_{a\bar{a}} \angle \gamma'_{a\bar{a}} & (\gamma'_{a\bar{a}} \angle \gamma_{a\bar{a}})' \\ \epsilon_{aa} \angle \epsilon'_{aa} & (\epsilon'_{aa} \angle \epsilon_{aa})' & \epsilon'_{a\bar{a}} \angle \epsilon_{a\bar{a}} & (\epsilon_{a\bar{a}} \angle \epsilon'_{a\bar{a}})' \end{array} \quad \text{V}$$

The results of V, together with the non-convertible character of γ**, are enough to establish the definitions of the four forms.

---

*Under the conditions mentioned above, in note, p. 2, we shall have to write $(\gamma_{a\bar{a}} \angle \gamma'_{a\bar{a}})'$. Implications V are an extension of the meaning of implication, made necessary by our having to call α_{aa} and $\epsilon_{a\bar{a}}$ true propositions. (See Boole, Investigation of the Laws of Thought, chap. XI, p. 169.)

**The operation of simple conversion consists in interchanging subject and predicate. By the principle, $(x \angle z)'(y \angle z) \angle (x \angle y)'$, and what has gone before, we have:

$$(\gamma_{ab} \angle \gamma'_{ab})'(\gamma_{ba} \angle \gamma'_{ab}) \angle (\gamma_{ab} \angle \gamma_{ba})'.$$

Definitions.

A form which is the contrary of itself is called a null-form. By V, β_{aa}, γ_{aa}, ϵ_{aa}, $\alpha_{a\bar{a}}$, $\beta_{a\bar{a}}$, $\gamma_{a\bar{a}}$, are null-forms.

A form which is the subcontrary of itself is called a one-form. By V, α_{aa}, $\epsilon_{a\bar{a}}$, are one-forms.

If x_{ab} is unprimed and x_{aa} a one-form then x_{ab} is called an α-form.

If x_{ab} is unprimed and simply convertible and if x_{aa} and $x_{a\bar{a}}$ are null-forms, then x_{ab} is called a β-form.

If x_{ab} is unprimed and not simply convertible, then x_{ab} is called a γ-form.

If x_{ab} is unprimed and $x_{a\bar{a}}$ a one-form, then x_{ab} is called an ϵ-form.

EXERCISES

(1) Assuming $k_{ab} = k_{ab} \cdot k_{ab}$, $k_{ab} \angle w'_{ab}$, show that,

$$\alpha_{ab} \angle \beta'_{ab}\ \gamma'_{ab}\ \epsilon'_{ab}\ \gamma'_{ba}$$
$$\beta_{ab} \angle \alpha'_{ab}\ \gamma'_{ab}\ \epsilon'_{ab}\ \gamma'_{ba}$$
$$\gamma_{ab} \angle \alpha'_{ab}\ \beta'_{ab}\ \epsilon'_{ab}\ \gamma'_{ba}$$
$$\epsilon_{ab} \angle \alpha'_{ab}\ \beta'_{ab}\ \gamma'_{ab}\ \gamma'_{ba}$$

by the aid of,

$$(x \angle y)\ (y \angle z) \angle (x \angle z),$$
$$(x \angle y) \angle (zx \angle zy).$$

Equality is defined by

$$(x \angle y)\ (y \angle x) \angle (x = y),$$
$$(x = y) \angle (x \angle y)\ (y \angle x).$$

If now

$$\beta'_{ab}\ \gamma'_{ab}\ \epsilon'_{ab}\ \gamma'_{ba} \angle \alpha_{ab}$$
$$\alpha'_{ab}\ \gamma'_{ab}\ \epsilon'_{ab}\ \gamma'_{ba} \angle \beta_{ab}$$
$$\alpha'_{ab}\ \beta'_{ab}\ \epsilon'_{ab}\ \gamma'_{ba} \angle \gamma_{ab}$$
$$\alpha'_{ab}\ \beta'_{ab}\ \gamma'_{ab}\ \gamma'_{ba} \angle \epsilon_{ab}$$

it will follow that

$$\alpha_{ab} = \beta'_{ab}\ \gamma'_{ab}\ \epsilon'_{ab}\ \gamma'_{ba} \qquad \alpha'_{ab} = \beta_{ab} + \gamma_{ab} + \epsilon_{ab} + \gamma_{ba}$$
$$\beta_{ab} = \alpha'_{ab}\ \gamma'_{ab}\ \epsilon'_{ab}\ \gamma'_{ba} \qquad \beta'_{ab} = \alpha_{ab} + \gamma_{ab} + \epsilon_{ab} + \gamma_{ba}$$
$$\gamma_{ab} = \alpha'_{ab}\ \beta'_{ab}\ \epsilon'_{ab}\ \gamma'_{ba} \qquad \gamma'_{ab} = \alpha_{ab} + \beta_{ab} + \epsilon_{ab} + \gamma_{ba}$$
$$\epsilon_{ab} = \alpha'_{ab}\ \beta'_{ab}\ \gamma'_{ab}\ \gamma'_{ba} \qquad \epsilon'_{ab} = \alpha_{ab} + \beta_{ab} + \gamma_{ab} + \gamma_{ba}$$

The second set of equations follows from the first by the principle, that the contradictory of a product is the sum of the contradictories of the separate factors, and by substituting k_{ab} directly for $(k'_{ab})'$.

(2) Show by the method of the last example that

$$\alpha_{ab} = \alpha_{ab}\ \beta'_{ab} = \alpha_{ab}\ \gamma'_{ab} = \alpha_{ab}\ \epsilon'_{ab}$$
$$\beta_{ab} = \beta_{ab}\ \alpha'_{ab} = \beta_{ab}\ \gamma'_{ab} = \beta_{ab}\ \epsilon'_{ab}$$
$$\gamma_{ab} = \gamma_{ab}\ \alpha'_{ab} = \gamma_{ab}\ \beta'_{ab} = \gamma_{ab}\ \epsilon'_{ab}$$
$$\epsilon_{ab} = \epsilon_{ab}\ \alpha'_{ab} = \epsilon_{ab}\ \beta'_{ab} = \epsilon_{ab}\ \gamma'_{ab}$$

Show too that

$$\alpha_{ab} = \alpha_{ab}\ \beta'_{ab}\ \gamma'_{ab} = \alpha_{ab}\ \beta'_{ab}\ \epsilon'_{ab} = \alpha_{ab}\ \gamma'_{ab}\ \epsilon'_{ab}, \text{ etc., etc.}$$

and that $\alpha_{ab} = \alpha_{ab}\ \beta'_{ab}\ \gamma'_{ab}\ \epsilon'_{ab}$, etc., etc.

Derive the analogues of the first set:

$$\alpha'_{ab} = \alpha'_{ab} + \beta_{ab} = \alpha'_{ab} + \gamma_{ab} = \alpha'_{ab} + \epsilon_{ab}, \text{ etc., etc.}$$

Accordingly, since $k_{ab} = k_{ab} \cdot w'_{ab}$ and $k'_{ab} = k'_{ab} + w_{ab}$, any primed letter is a modulus of multiplication with respect to any unprimed letter not itself and any unprimed letter is a modulus of addition with respect to any primed letter not itself.

The propositional *zero* is defined by

$$(xy \angle (xy)') \angle (xy \angle 0),$$
$$(xy \angle 0) \angle (xy \angle (xy)'),$$

and the propositional *one* by

$$((xy)' \angle xy) \angle (1 \angle xy),$$
$$(1 \angle xy) \angle ((xy)' \angle xy).$$

From the principles,

$$(x \angle y') \angle (xy \angle (xy)'),$$
$$(xy \angle (xy)') \angle (x \angle y'),$$

it follows that

$$(x \angle y') \angle (xy \angle 0)$$
$$(xy \angle 0) \angle (x \angle y')$$

(3) Derive:

$k_{ab} \cdot k'_{ab} \angle (k_{ab} \cdot k'_{ab})'$; $(k_{ab} + k'_{ab})' \angle k_{ab} + k'_{ab}$;
$k_{ab} \cdot w_{ab} \angle (k_{ab} \cdot w_{ab})'$; $((k_{ab} + w_{ab})' \angle k_{ab} + w_{ab})'$;
$(k'_{ab} \cdot w'_{ab} \angle (k'_{ab} \cdot w'_{ab})')'$; $(k'_{ab} + w'_{ab})' \angle k'_{ab} + w'_{ab}$;
$(k_{ab} \cdot w'_{ab} \angle (k_{ab} \cdot w'_{ab})')'$; $((k_{ab} + w'_{ab})' \angle k_{ab} + w'_{ab})'$.

(4) Show that

$$\alpha_{ab}\, \beta_{ab} \angle 0,\ \alpha_{ab}\, \gamma_{ab} \angle 0, \text{ etc.}$$
$$1 \angle \alpha'_{ab} + \beta'_{ab},\ 1 \angle \alpha'_{ab} + \gamma'_{ab}, \text{ etc.}$$

and that

$$\alpha'_{ab}\, \beta'_{ab}\, \gamma'_{ab}\, \epsilon'_{ab}\, \gamma'_{ba} \angle 0$$
$$1 \angle \alpha'_{ab} + \beta'_{ab} + \gamma'_{ab} + \epsilon'_{ab} + \gamma'_{ba}$$

(5) Assuming $x_{ab} = x_{ab} \cdot x_{ab}$, $x_{ab} = x_{ab} + x_{ab}$, show that

$$\alpha'_{ab}\, \beta'_{ab} = \gamma_{ab} + \epsilon_{ab} + \gamma_{ba},\ \alpha'_{ab}\, \gamma'_{ab} = \beta_{ab} + \epsilon_{ab} + \gamma_{ba}, \text{ etc.}$$
$$\alpha_{ab} + \beta_{ab} = \gamma'_{ab}\, \epsilon'_{ab}\, \gamma'_{ba},\ \alpha_{ab} + \gamma_{ab} = \beta'_{ab}\, \epsilon'_{ab}\, \gamma'_{ba}, \text{ etc.}$$

(6) Derive the general result:

$$(k_{a,b} \angle w_{a,b})'.$$

The comma between the terms indicates that the term order is not fixed. Thus $k_{a,b}$ stands for either k_{ab} or k_{ba}.

(7) From the principle,

$$(x \angle z)' (y \angle z) \angle (x \angle y)',$$

and the postulate $(\alpha_{aa} \angle \alpha'_{aa})'$,
derive $(\alpha_{aa} \angle \beta_{aa})'$, $(\alpha_{aa} \angle \gamma_{aa})'$, $(\alpha_{aa} \angle \epsilon_{aa})'$.

(8) From the principles,

$$(x \angle y) (y \angle z) \angle (x \angle z),$$
$$(x' \angle x) \angle (y \angle x),$$
$$(x \angle x') \angle (x \angle y),$$

and the postulate, $\alpha'_{aa} \angle \alpha_{aa}$, show that all propositions of the form $x_{aa} \angle y_{aa}$, except the three cases in the last example, are valid implications, x_{aa} and y_{aa} representing only the unprimed letters.

(9) By the method of the last example, prove that $(\alpha_{aa} \angle \alpha'_{aa})'$ is the only invalid implication of the form $x_{aa} \angle y'_{aa}$.

(10) Derive seven valid implications in each one of the forms $x'_{aa} \angle y_{aa}$ and $x'_{a\bar{a}} \angle y_{a\bar{a}}$ and nine invalid implications of each one of the same forms.

(11) From $(\epsilon_{a\bar{a}} \angle \epsilon'_{a\bar{a}})'$ by the method of example 7 derive $(\epsilon_{a\bar{a}} \angle \alpha_{a\bar{a}})'$, $(\epsilon_{a\bar{a}} \angle \beta_{a\bar{a}})'$, $(\epsilon_{a\bar{a}} \angle \gamma_{a\bar{a}})'$.

(12) From $\epsilon'_{a\bar{a}} \angle \epsilon_{a\bar{a}}$ by the method of example 8 derive thirteen valid implications.

(13) Show that $(\epsilon_{a\bar{a}} \angle \epsilon'_{a\bar{a}})'$ is the only invalid implication of the form $x_{a\bar{a}} \angle y'_{a\bar{a}}$.

(14) Derive the following implications:

$1 \angle \alpha_{aa}$	$\alpha'_{aa} \angle 0$	$1 \angle \alpha'_{a\bar{a}}$	$\alpha_{a\bar{a}} \angle 0$
$1 \angle \beta'_{aa}$	$\beta_{aa} \angle 0$	$1 \angle \beta'_{a\bar{a}}$	$\beta_{a\bar{a}} \angle 0$
$1 \angle \gamma'_{aa}$	$\gamma_{aa} \angle 0$	$1 \angle \gamma'_{a\bar{a}}$	$\gamma_{a\bar{a}} \angle 0$
$1 \angle \epsilon'_{aa}$	$\epsilon_{aa} \angle 0$	$1 \angle \epsilon_{a\bar{a}}$	$\epsilon'_{a\bar{a}} \angle 0$

$(1 \angle \alpha'_{aa})'$	$(\alpha_{aa} \angle 0)'$	$(1 \angle \alpha_{a\bar{a}})'$	$(\alpha'_{a\bar{a}} \angle 0)'$
$(1 \angle \beta_{aa})'$	$(\beta'_{aa} \angle 0)'$	$(1 \angle \beta_{a\bar{a}})'$	$(\beta'_{a\bar{a}} \angle 0)'$
$(1 \angle \gamma_{aa})'$	$(\gamma'_{aa} \angle 0)'$	$(1 \angle \gamma_{a\bar{a}})'$	$(\gamma'_{a\bar{a}} \angle 0)'$
$(1 \angle \epsilon_{aa})'$	$(\epsilon'_{aa} \angle 0)'$	$(1 \angle \epsilon'_{a\bar{a}})'$	$(\epsilon_{a\bar{a}} \angle 0)'$

Some of the postulates in the text (p. 2) of the form, $(k'_{ab} \angle w_{ab})'$, $(k_{ab} \angle k'_{ab})'$, $(k'_{ab} \angle k_{ab})'$, may be established by

reducing them to one of the forms, $(k'_{aa} \angle w_{aa})'$, $(k'_{a\bar{a}} \angle w_{a\bar{a}})'$ $(k_{aa} \angle k'_{aa})'$, etc., cases already considered in preceding exercises

(15) Establish the invalidity of

$\alpha'_{ab} \angle \beta_{ab}$ $\quad$ $\alpha'_{ab} \angle \gamma_{ab}$ $\quad$ $\gamma'_{ab} \angle \gamma_{ba}$

$\beta'_{ab} \angle \gamma_{ab}$ $\quad$ $\beta'_{ab} \angle \epsilon_{ab}$ $\quad$ $\gamma'_{ab} \angle \epsilon_{ab}$

$\alpha'_{ab} \angle \alpha_{ab}$ $\quad$ $\beta'_{ab} \angle \beta_{ab}$ $\quad$ $\gamma'_{ab} \angle \gamma_{ab}$

$\alpha_{ab} \angle \alpha'_{ab}$ $\quad$ $\epsilon_{ab} \angle \epsilon'_{ab}$ $\quad$ $\epsilon'_{ab} \angle \epsilon_{ab}$

CHAPTER II

§4. At this point in our theory it will be necessary to introduce certain indefinables, which we shall call the distinctions of *better* and *worse*, following a suggestion of Sir William Hamilton's.* For our immediate purpose it will be enough to define *better than* and *worse than* denotatively, establishing an order among the four forms by a simple enumeration. *Better than* and *worse than* are not transitive relations. When we wish to express the rules for the deduction of the moods symbolically, we shall have to invent symbols to represent *worse than* (/), *doubly worse than* (//), and *trebly worse than* (///). This necessity is avoided in the verbal statement of the principles of deduction by the words "in the same degree" (see rule 1 below).

Definitions.—An ϵ-form is worse than an α-, a β-, or a γ-form.

A γ-form is worse than an α- or a β-form.

A β-form is worse than an α-form.

Best. α-- β-- γ-- ϵ *Worst.*

§5. Immediate inference is a form of implication belonging to one of the types:

1. $x_{ab} \angle y_{ab}$. 2. $x_{ab} \angle y_{ba}$.

These differences are known as the first and the second *figures* of immediate inference respectively.

The part to the left of the implication sign is called the *antecedent;* the part to the right is called the *consequent.*

---

*Lectures on Logic, Appendix, p. 536.

Since x and y may take on any of the forms, α, β, γ, ϵ, there will be sixteen propositions of each type, obtained from the permutations of the letters two at a time and by taking each letter once with itself. Each one of the sixteen distinct propositions in each one of the two figures is called a *mood* of immediate inference. The rules which follow below, applied to the postulates, will yield all the true and all the false propositions of each type.

Valid Moods.

1. In any valid mood of the first figure make antecedent and consequent worse in the same degree.

2. In any valid mood convert simply in any form but γ.

Postulate: $\alpha_{ab} \angle \alpha_{ab}$. *Theorems:* The other (6) valid moods.

Invalid Moods.

1. In any invalid mood of the first figure make antecedent and consequent worse in the same degree.

2. In any invalid mood of the first figure interchange antecedent and consequent.

3. In any invalid mood convert simply in any form but γ.

*Postulates:**

$\{\alpha_{ab} \angle \beta_{ab}\}'$; $\{\alpha_{ab} \angle \gamma_{ab}\}'$; $\{\alpha_{ab} \angle \epsilon_{ab}\}'$; $\{\gamma_{ab} \angle \gamma_{ba}\}'$.

Theorems: The other (21) invalid moods.

§6. We may also formulate rules for the detection of the invalid moods. These are:

---

*The mark (′) over the bracket is intended to indicate that the mood is invalid.

1. If the antecedent be worse than the consequent, the mood is invalid.

2. If the antecedent be better than the consequent, the mood is invalid.

Definition.—Distributed terms are those modified, either implicitly or explicitly, by the adjective *all*, i. e. the subject of the α-, γ- and ϵ-form, and the predicate of the α- and ϵ-form.

3. If a term be distributed in the consequent but undistributed in the antecedent, the mood is invalid.

§7. A syllogism is a form of implication belonging to one of the types:

1. $x_{ba}\, y_{cb} \angle z_{ca} = (x\ y\ z)_1$
2. $x_{ab}\, y_{cb} \angle z_{ca} = (x\ y\ z)_2$
3. $x_{ba}\, y_{bc} \angle z_{ca} = (x\ y\ z)_3$
4. $x_{ab}\, y_{bc} \angle z_{ca} = (x\ y\ z)_4$

These differences are known as the first, second, third, and fourth *figures* of the syllogism respectively. The two forms conjoined in the antecedent are called the *premises* and the consequent is called the *conclusion*. The predicate of the conclusion is called the *major* term and points out the *major* premise, which by convention is written first, and the subject of the conclusion is called the *minor* term and points out the *minor* premise. The term common to both premises and which does not appear in the conclusion is called the *middle* term.

Since x, y and z may have any one of the values, α, β, γ, ϵ, there will be sixty-four ways in each one of the four figures, called the *moods* of the syllogism, in which $x\,y \angle z$ can be expressed. There will be consequently

two hundred and fifty-six cases to consider. Twenty-nine of these are valid implications; the remaining two hundred and twenty-seven are invalid. From the rules and postulates below, all the moods, valid and invalid, may be deduced.

Valid Moods.

1. In any valid mood of the third figure make a like major premise and conclusion worse in the same degree.

2. In any valid mood of the second figure make a like minor premise and conclusion worse in the same degree.

3. In any valid mood convert simply in any form but γ.

Postulates:

$(\alpha\alpha\alpha)_1$
$(\gamma\gamma\gamma)_1$
$(\epsilon\gamma\epsilon)_1$

Theorems:

$(\alpha\alpha\alpha)_{2,3,4}$
$(\alpha\beta\beta)_{1,2,3,4}$
$(\alpha\gamma\gamma)_{1,2}$
$(\alpha\epsilon\epsilon)_{1,2,3,4}$
$(\gamma\epsilon\epsilon)_{2,4}$
$(\beta\alpha\beta)_{1,2,3,4}$
$(\gamma\alpha\gamma)_{1,3}$
$(\epsilon\alpha\epsilon)_{1,2,3,4}$
$(\epsilon\gamma\epsilon)_2$

Invalid Moods.

1. In any invalid mood of the third figure make a like major premise and conclusion better in the same degree.

2. In any invalid mood of the second figure make a like minor premise and conclusion better in the same degree.

3. If the premises and conclusion of an invalid mood in the fourth figure are all alike, make them all worse in the same degree.

4. If the premises and conclusion of an invalid mood are all alike make the conclusion any degree better or any degree worse.

5. If the premises and conclusion of an invalid mood are all unlike, interchange them in any order.

6. In any invalid mood convert simply in any form but γ.

*Postulates:**

$(\alpha\alpha\beta)'_1$ $(\alpha\beta\epsilon)'_1$ $(\beta\gamma\gamma)'_3$ $(\gamma\gamma\gamma)'_2$ $(\epsilon\beta\epsilon)'_1$
$(\alpha\alpha\gamma)'_1$ $(\alpha\gamma\gamma)'_3$ $(\beta\epsilon\gamma)'_1$ $(\gamma\epsilon\gamma)'_2$ $(\epsilon\gamma\gamma)'_3$
$(\alpha\alpha\epsilon)'_1$ $(\alpha\epsilon\gamma)'_1$ $(\gamma\alpha\gamma)'_2$ $(\epsilon\alpha\gamma)'_1$ $(\epsilon\gamma\epsilon)'_3$
$(\alpha\beta\gamma)'_1$ $(\beta\alpha\gamma)'_1$ $(\gamma\beta\gamma)'_2$ $(\epsilon\beta\gamma)'_1$

Theorems:

The other (208) invalid moods.

§8. As in the case of immediate inference we may formulate rules for the detection of the invalid moods of the syllogism. These are five in number.

1. A mood is invalid if the conclusion differ from the worse premise.

2. A mood is invalid if an α- and a γ- premise be conjoined in the antecedent and the middle term be undistributed in the major premise.

3. A mood is invalid if the middle term be undistributed in both premises.

4. A mood is invalid if a term which is distributed in the conclusion be undistributed in the premise.

5. A mood is invalid if each premise be in the ϵ-form.**

---

*The mark (′) over the bracket is intended to indicate that the mood is invalid.

**These rules are, of course, not sufficient to declare $(\gamma\epsilon\epsilon)_{2,4}$ and $(\epsilon\gamma\epsilon)_{1,2}$ invalid, in case we decide to so regard them. See the concluding remarks of chap. III.

EXERCISES

If $x_{a,b} \angle y_{a,b}$ be denoted simply by (xy), (the comma between the terms indicating that the term order and so the figure, is not determined), the array of sixteen propositions may be constructed thus:

$\underline{\underline{\alpha\alpha}}$	$\beta\alpha$	$\gamma\alpha$	$\epsilon\alpha$
$\alpha\beta$	$\underline{\underline{\beta\beta}}$	$\gamma\beta$	$\epsilon\beta$
$\alpha\gamma$	$\beta\gamma$	$\underline{\gamma\gamma}$	$\epsilon\gamma$
$\alpha\epsilon$	$\beta\epsilon$	$\gamma\epsilon$	$\underline{\underline{\epsilon\epsilon}}$

the moods valid in both figures being underlined twice, the one valid only in the first figure being underlined once. Applying the first rule to the postulate, we obtain in succession, $\beta\beta$, $\gamma\gamma$, $\epsilon\epsilon$, in the first figure; and converting simply in the consequent of those valid in the first figure, except $\gamma\gamma$, we obtain $\alpha\alpha$, $\beta\beta$, $\epsilon\epsilon$ in the second figure.

(1) From the rules and postulates for the derivation of the invalid moods deduce the remaining twenty-one invalid moods.

The rules for the immediate detection of the invalid moods are all *necessary* if we can point to at least one example which falls uniquely under each rule. They are *sufficient* if they declare all the invalid moods to be invalid.

(2) Construct the set of propositions of immediate inference and place after each invalid mood the number of a rule which declares it to be invalid.

(3) Make a list of moods which are declared invalid by the first rule and by no other rule, and a list of moods which are declared invalid by the second rule and by no other rule.

(4) Find an invalid mood which is declared invalid by the third rule and by no other rule and prove that it is the only unique illustration of this rule.

For those who approach the study of the syllogism for the first time, it may facilitate manipulation to point out the general effect of conversion in the form of certain rules.

1. Simple conversion in the major premise changes the first figure to the second and conversely, the third figure to the fourth and conversely.

2. Simple conversion in the minor premies, changes the first figure to the third and conversely, the second figure to the fourth and conversely.

3. Simple conversion in the conclusion changes the first figure to the fourth and conversely and leaves the second and third figure unchanged.

It must of course not escape the beginner's notice that the effect of converting simply in the conclusion is to interchange the premises, since the major term then becomes the minor term and the minor term becomes the major term. The conjunctive relation of logic being commutative, the order of the premises is indifferent, but we agree, as a matter of convention, always to write the major premise first.

(5) From $(\epsilon\gamma\epsilon)_1$, and the third rule under the valid moods alone, deduce $(\epsilon\gamma\epsilon)_2$, $(\gamma\epsilon\epsilon)_2$ and $(\gamma\epsilon\epsilon)_4$.

(6) From the rules and postulates deduce the remaining valid moods.

(7) Assuming only the third rule under the valid moods and the rule: in any valid mood of the *first* figure make a like major premise and conclusion worse in the same degree, deduce all the remaining valid moods from $(\alpha\alpha\alpha)_1$, $(\gamma\gamma\gamma)_1$ and $(\alpha\gamma\gamma)_1$.

(8) Assuming only the second and third rules under the valid moods deduce the remaining valid moods from $(\alpha\alpha\alpha)_1$, $(\gamma\gamma\gamma)_1$, $(\gamma\alpha\gamma)_1$ and $(\epsilon\gamma\epsilon)_1$.

(9) From $(\epsilon\beta\epsilon)'_1$ alone deduce seventy-eight other invalid moods.

(10) From $(\alpha\beta\epsilon)'_1$ alone deduce twenty-three other invalid moods.

(11) Deduce the invalid moods in the first figure which have a γ-minor premise.

The rules for the immediate detection of the invalid moods are *sufficient*, if they declare all the moods not already found to be valid to be invalid. They are all *necessary* if we can point to at least one example which falls uniquely under each rule.

(12) Construct the array of the syllogism and place after each invalid mood the number of a rule that declares it to be invalid.

(13) Show that it follows from one of the rules alone that two β-premises do not imply a conclusion.

(14) Prove that there are only two moods which illustrate the second rule uniquely.

(15) Make a list of examples which fall uniquely under each one of the rules.

CHAPTER III

§9. In this third chapter it is proposed to completely define the relationships of *better* and *worse* by deducing all the true and all the false propositions into which these relationships may enter and then to give a complete expression in the language of symbols of the rules for the deduction of the moods of immediate inference and the syllogism.

§10. Let us, first of all, invent symbols to denote *worse than*, *doubly worse than*, and *trebly worse than*, i. e.

x / y = x is worse than y,
x // y = x is doubly worse than y,
x /// y = x is trebly worse than y,

and let us add the following:

Definition.—In the propositions, x / y, x // y, and x /// y, x is called the *inferior*, y the *superior* form.

Since x and y may take on any of the four forms $\alpha, \beta, \gamma, \epsilon$, there will be sixteen possible propositions of each type, x / y, x // y and x /// y, obtained by permuting the letters two at a time and by taking each letter once with itself. The following postulates and principles will yield all the valid moods of each type. We have assumed four principles here because the principles for the deduction of the invalid moods may be derived from these four as theorems.

Principles:

i. (x / y) (y // z) ∠ (x /// z)
ii. (x / y) (z // x) ∠ (z /// y)
iii. (x / z) (y /// z) ∠ (y // x)
iv. (x / z) (y // z) ∠ (y / x)

Postulates: β / α; ϵ / γ; γ // α.

Theorems: γ / β; ϵ // β; ϵ /// α.

We may also formulate rules for the derivation of the moods. It will then be necessary to assume one postulate only.

Definition:—In the propositions, x / y, x // y and x///y, the relation connecting x and y is known as the *worse-relation.*

Definition:—Trebly worse (///) is worse than *doubly worse* (//) and doubly worse than *worse* (/). *Doubly worse* (//) is worse than *worse* (/).

The rules are:

1. In any valid mood make superior and inferior form one degree better or one degree worse.

2. In any valid mood make inferior form and worse-relation one degree better or one degree worse.

Postulate:	*Theorems:*
β / α.	The other (5) valid moods.

The invalid moods of each type may be derived from the following postulates and principles:

*Principles:**

i. $(x / y)\ (x///z)' \angle (y // z)'$
$(x///z)'\ (y // z) \angle (x / y)'$

ii. $(x / y)\ (z///y)' \angle (z // x)'$
$(z///y)'\ (z // x) \angle (x / y)'$

iii. $(x / z)\ (y // x)' \angle (y///z)'$
$(y // x)'\ (y///z) \angle (x / z)'$

iv. $(x / z)\ (y / x)' \angle (y // z)'$
$(y / x)'\ (y // z) \angle (x / z)'$

---

*These principles follow from those used for the deduction of the valid moods by $(xy \angle z) \angle (xz' \angle y')$.

Postulates:	*Theorems:*
$(\alpha///\epsilon)'$; $(\beta///\epsilon)'$; $(\gamma///\epsilon)'$; $(\epsilon///\epsilon)'$; $(\epsilon///\gamma)'$; $(\epsilon///\beta)'$.	The other (36) invalid moods.

As in the case of the valid moods, rules may be formulated for the derivation of the invalid moods. Here it will be necessary to assume only three postulates. The rules are:

1. In any invalid mood make superior and inferior form one degree better or one degree worse.
2. In any invalid mood make inferior form and worse-relation one degree better or one degree worse.
3. In any invalid mood make superior form three degrees worse.

Postulates:	*Theorems:*
$(\alpha\ /\ \gamma)'$; $(\gamma\ /\ \alpha)'$; $(\epsilon\ /\ \alpha)'$.	The other (39) invalid moods.

§11. Having now completely defined the relationships of *better* and *worse* by deducing all the propositional forms into which these relationships may enter, there remains for this chapter only one other task, which is to deduce symbolically the moods of immediate inference and the syllogism.

§12. From the postulates and principles, which are given below, all the moods, valid and invalid, of immediate inference may be deduced.

Principles:

i. $(y\ /\ x)\ (x_{a\,b} \angle x_{a\,b}) \angle (y_{a\,b} \angle y_{a\,b})$.
iv. $(x \angle y)\ (y \angle z) \angle (x \angle z)$.

Postulates:	*Theorems:*
$\alpha_{ab} \angle \alpha_{ba}$; $\beta_{ab} \angle \beta_{ba}$; $\epsilon_{ab} \angle \epsilon_{ba}$.	The other valid moods.

*Principles:**

ii. $(x\ /\ y)\ (x_{a\,b} \angle x_{a\,b}) \angle (x_{a\,b} \angle y_{a\,b})'$
$(x//y)\ (x_{a\,b} \angle x_{a\,b}) \angle (x_{a\,b} \angle y_{a\,b})'$

iii. $(y\ /\ x)\ (x_{a\,b} \angle x_{a\,b}) \angle (x_{a\,b} \angle y_{a\,b})'$
$(y//x)\ (x_{a\,b} \angle x_{a\,b}) \angle (x_{a\,b} \angle y_{a\,b})'$

v. $(x \angle y)\ (x \angle z)' \angle (y \angle z)'$
$(x \angle z)'\ (y \angle z) \angle (x \angle y)'$

Postulates:

$(\alpha_{ab} \angle \epsilon_{ab})'$; $(\epsilon_{ab} \angle \alpha_{ab})'$; $(\gamma_{ab} \angle \gamma_{ba})'$.

Theorems:

The other invalid moods.

§13. All the valid and invalid moods of the syllogism may be deduced from the assumptions which follow. The right to convert simply in any form but γ is expressed under v and vi. It will be evident that some of the postulates might have been saved at the expense of introducing new principles, and conversely. The first two principles for the deduction of the invalid moods under iv are theorems from the ones that have gone before under i, by $(xy \angle z) \angle (xz' \angle y')$.

Principles:

i. $(y\ /\ x)\ (x_{ba}\, z_{bc} \angle x_{ca}) \angle (y_{ba}\, z_{bc} \angle y_{ca})$
$(y\ /\ x)\ (z_{ab}\, x_{cb} \angle x_{ca}) \angle (z_{ab}\, y_{cb} \angle y_{ca})$

v. $(xy \angle z)\ (z \angle w) \angle (xy \angle w)$
$(xy \angle z)\ (w \angle x) \angle (wy \angle z)$
$(xy \angle z)\ (w \angle y) \angle (xw \angle z)$

---

*These principles, except the second under iii are really special cases of principles i and iii under the syllogism, obtained from the latter by making b=c, the primed part of the antecedent in iii becoming unprimed in the special case.

Postulates: $(\alpha\alpha\alpha)_1$; $(\gamma\gamma\gamma)_1$; $(\epsilon\gamma\epsilon)_1$.
Theorems: The other (26) valid moods.

Principles:

ii. $(y / x)(z / y)(xy \angle z)' \angle (xz \angle y)'$
$(y / x)(z // y)(xy \angle z)' \angle (xz \angle y)'$
$(y // x)(y / z)(xy \angle z)' \angle (xz \angle y)'$
$(y /// x)(y / z)(xy \angle z)' \angle (xz \angle y)'$
$(y / x)(z / y)(xy \angle z)' \angle (zy \angle x)'$
$(y / x)(z // y)(xy \angle z)' \angle (zy \angle x)'$
$(y // x)(y / z)(xy \angle z)' \angle (zy \angle x)'$
$(y /// x)(y / z)(xy \angle z)' \angle (zy \angle x)'$.

iii. $(x / y)(x_{a,b}\, x_{b,c} \angle x_{ca})' \angle (x_{a,b}\, x_{b,c} \angle y_{ca})'$
$(x // y)(x_{a,b}\, x_{b,c} \angle x_{ca})' \angle (x_{a,b}\, x_{b,c} \angle y_{ca})'$
$(y / x)(x_{a,b}\, x_{b,c} \angle x_{ca})' \angle (x_{a,b}\, x_{b,c} \angle y_{ca})'$

iv. $(x / z)(y_{ab}\, x_{cb} \angle x_{ca})' \angle (y_{ab}\, z_{cb} \angle z_{ca})'$
$(x / z)(x_{ba}\, y_{bc} \angle x_{ca})' \angle (z_{ba}\, y_{bc} \angle z_{ca})'$
$(y / x)(x_{ab}\, x_{bc} \angle x_{ca})' \angle (y_{ab}\, y_{bc} \angle y_{ca})'$

vi.* $(xy \angle z)'\,(w \angle z) \angle (xy \angle w)'$
$(xy \angle z)'\,(x \angle w) \angle (wy \angle z)'$
$(xy \angle z)'\,(y \angle w) \angle (xw \angle z)'$

Postulates:

$(\alpha\alpha\beta)'_1$ $(\alpha\beta\gamma)'_1$ $(\alpha\epsilon\gamma)'_1$ $(\beta\gamma\gamma)'_3$ $(\gamma\beta\gamma)'_2$ $(\epsilon\alpha\gamma)'_1$ $(\epsilon\gamma\gamma)'_3$
$(\alpha\alpha\gamma)'_1$ $(\alpha\beta\epsilon)'_1$ $(\beta\alpha\gamma)'_1$ $(\beta\epsilon\gamma)'_1$ $(\gamma\gamma\gamma)'_2$ $(\epsilon\beta\gamma)'_1$ $(\epsilon\gamma\epsilon)'_3$
$(\alpha\alpha\epsilon)'_1$ $(\alpha\gamma\gamma)'_3$ $(\beta\beta\epsilon)'_1$ $(\gamma\alpha\gamma)'_2$ $(\gamma\epsilon\gamma)'_2$ $(\epsilon\beta\epsilon)'_1$ $(\epsilon\epsilon\alpha)'_1$

Theorems:

The other (206) invalid moods.

---

*Principles v and vi are of course not independent. The first under v is a variation of transitivity, the third a variation of the second by $xy \angle yx$. Those under vi follow from those under v by $(xy \angle z) \angle (xz' \angle y')$. Principles v under immediate inference follow from transitivity by the same principle.

§14. We have already pointed out, (note p. 2), that the product $\gamma_{a,b}\ \epsilon_{a,b}$ does not vanish in general if we allow the possibility of the limiting values 0 and 1 for the terms. Under these conditions, $(\gamma\,\epsilon\,\epsilon)_{2,4}$ and $(\epsilon\gamma\,\epsilon)_{1,2}$ are not valid moods of the syllogism, for they become $\gamma_{01}\ \epsilon_{0,1} \angle 0$, for $a=c=0$ and $b=1$. A logic, which recognizes these limiting values of the terms, will have to postulate $(\epsilon\gamma\,\epsilon)'_1$, say, which yields, $(\epsilon\gamma\,\epsilon)'_2$ and $(\gamma\,\epsilon\,\epsilon)'_{2,4}$.

The only change, which we should then have to make in chapters II and III, would be to replace $(\gamma\gamma\gamma)'_2$ among the postulates by $(\epsilon\gamma\,\epsilon)'_1$, from which $(\gamma\gamma\gamma)'_2$ follows as a theorem, and to subtract $(\epsilon\gamma\,\epsilon)_{1,2}$ and $(\gamma\,\epsilon\,\epsilon)_{2,4}$ from the list of valid moods.

This logic, which might be called non-Aristotelian, or semi-Aristotelian, or imaginary logic, is more general than the ordinary or classical logic and includes the latter as a special case, becoming, in fact, identical with it when the field of its application is narrowed so as to exclude "nothing" and "universe" as limiting values of the terms. One principle, which is true in the special, but not in the general case, is:

$$(y\ /\ x)\ (x_{ba}\ z_{cb} \angle x_{ca}) \angle (y_{ba}\ z_{cb} \angle y_{ca}),$$

and this principle may be regarded as the differentiating character of the two cases. If we had chosen to assume it, instead of the first principle under i, we could have saved the third postulate, but the second principle under iv would not then have followed as a theorem.

The definitions of chapter I, §3, hold for both cases; the only change to be made in implications V in order to make them true in the more general logic, will be to replace $\gamma_{a\bar{a}}=0$ by $\gamma_{a\bar{a}} \neq 0$, and this property has not been made use of in defining the γ-form.

The Aristotelian forms, A, E, I, O, (see Appendix I), will yield only eight valid moods of the syllogism, under the new condition, instead of the twenty-four valid moods commonly recognized. They satisfy all the conditions of maximum simplicity in the special or classical instance—they are the best possible forms to choose for the construction of an Aristotelian logic—but they fail in the general instance, for they then lose their peculiar advantage, that, corresponding to any member of the set there should be another member of the set which represents its contradictory.

EXERCISES

By the aid of the principles,

$(xy \angle z)\ (z \angle w) \angle (xy \angle w)$
$(xy \angle z)\ (w \angle x) \angle (wy \angle z)$
$(xy \angle z)\ (w \angle y) \angle (xw \angle z)$

we are enabled to convert in either premise or the conclusion. The example which follows will illustrate the method.

$$(\gamma_{ba}\, \alpha_{cb} \angle \gamma_{ca})\ (\alpha_{ab} \angle \alpha_{bc}) \angle (\gamma_{ba}\, \alpha_{bc} \angle \gamma_{ca})$$

(1) From $(\epsilon\gamma\epsilon)_1$ derive $(\gamma\,\epsilon\,\epsilon)_{2,4}$.

(2) From the principles and the postulates in the text deduce the remaining valid moods.

(3) From the postulates, $(\alpha\alpha\alpha)_1$, $(\gamma\gamma\gamma)_1$, $(\alpha\gamma\gamma)_1$ and the principle $(y/x)\ (x_{ba}\, z_{cb} \angle x_{ca}) \angle (y_{ba}\, z_{cb} \angle y_{ca})$ deduce the remaining valid moods.

If we identify the subject and predicate of the conclusion in the mood, $(\beta\alpha\beta)_3$, we obtain $\beta_{ba}\, \alpha_{ba} \angle 0$, (chapter I, implications v). By the aid of $(xy \angle 0) \angle (x \angle y')$ it follows that $\alpha_{ab} \angle \beta'_{ab}$.

(4) Deduce as many as possible of the propositions of the form, $x_{ab} \angle y'_{ab}$, (chapter I, p. 2) by identifying subject and predicate in the conclusion of the valid moods of the syllogism.

The principles,

$(xy \angle z)'\ (w \angle z) \angle (wy \angle w)'$
$(xy \angle z)'\ (x \angle w) \angle (wy \angle z)'$
$(xy \angle z)'\ (y \angle w) \angle (xw \angle z)'$

enable us to convert in either premise or the conclusion.

(5) From $(\beta\beta\beta)'_1$, derive the invalidity of this mood in the other figures.

(6) From $(\epsilon\beta\epsilon)'_1$ alone and principles iii, iv and vi deduce seventy other invalid moods.

(7) From $(\alpha\beta\gamma)'_1$ alone and principles ii deduce nineteen other invalid moods.

(8) Deduce the invalid moods in the third figure, whose conclusion is in the γ-form.

(9) Deduce the invalid moods in the fourth figure, whose major premise is in the γ-form.

(10) From $\gamma\gamma\gamma_1$ alone, deduce forty-six valid implications of the form $L_{a,b}\, M_{b,c} \angle N'_{ca}$,—L, M and N representing only the unprimed letters.

(11) Assuming $\epsilon\gamma\epsilon_{1,2}$ and $\gamma\epsilon\epsilon_{2,4}$ to be invalid, show that $\gamma\gamma\gamma_1$ yields only thirteen valid implications of the form given in the last exercise.

(12) Assuming $(\beta\beta\beta')'_1\ (\beta\beta\gamma')'_1\ (\beta\beta\epsilon')'_1\ (\gamma\gamma\beta')'_2\ (\gamma\gamma\beta')'_3\ (\gamma\gamma\gamma')'_1\ (\gamma\gamma\epsilon')'_2\ (\epsilon\gamma\beta')'_3\ (\epsilon\gamma\epsilon')'_3\ (\epsilon\epsilon\beta')'_1\ (\epsilon\epsilon\epsilon')'_1$
deduce sixty-nine other non-implications of the same form.

Any non-implication of the form, $L_{b,a}\, M_{c,b} \angle N'_{ca}$, which contains an α-form may be proven invalid by identifying terms in the α-form. Thus $\beta_{ba}\,\beta_{bc} \angle \alpha'_{ca}$ reduces to $\beta_{ba} \angle \beta'_{ba}$ for $c=a$; $\gamma_{ba}\,\alpha_{cb} \angle \gamma'_{ca}$ reduces to $\gamma_{ba} \angle \gamma'_{ba}$ for $c=b$, etc.

(13) Establish the invalidity of the thirty-four non-implications of the form $L_{b,a}\, M_{a,b} \angle N'_{ca}$ not accounted for in the preceding exercise.

(14) Show that there are thirty-six, and only thirty-six, distinct valid implications of the form $L_{a,b}\, M_{b,c}\, N_{c,a} \angle 0$,—L, M and N representing only the unprimed letters, α, β, γ, ϵ.

(15) Derive indirectly the $(\gamma\gamma\gamma')'_1$ of exercise 12.

A certain number of the postulates for the derivation of the invalid moods of the syllogism (p. 21) may be shown indirectly to be invalid by reducing them to invalid moods of immediate inference. Thus $(\alpha\alpha\beta)_1$ reduces to $\alpha_{ab} \angle \alpha'_{ab}$ when the terms in the conclusion are identified, and $(\alpha\beta\gamma)_1$ reduces to $\beta_{ca} \angle \gamma_{ca}$ when we identify terms in the major premise and suppress the part α_{aa} (see chap. IV).

(16) Establish the invalidity of

$(\alpha\alpha\gamma)_1$	$(\alpha\alpha\epsilon)_1$	$(\beta\beta\epsilon)_1$
$(\alpha\beta\epsilon)_1$	$(\alpha\epsilon\gamma)_1$	$(\beta\alpha\gamma)_1$
$(\epsilon\alpha\gamma)_1$	$(\alpha\gamma\gamma)_3$	$(\gamma\alpha\gamma)_2$

Most of the other postulates for the deduction of the invalid moods of the syllogism may be reduced by the method of the following example:

Suppose that $(\epsilon\beta\gamma)_1$ is valid. Now $(\epsilon\beta\gamma')_1$ is valid by a preceding exercise.

$\therefore (\epsilon_{ba}\,\beta_{cb} \angle \gamma_{ca})\ (\epsilon_{ba}\,\beta_{cb} \angle \gamma'_{ca}) \angle (\epsilon_{ba}\,\beta_{cb} \angle 0)$
since $(x \angle y)\ (x \angle y') \angle (x \angle 0)$.

Consequently $\epsilon_{ba}\,\beta_{cb} \angle \epsilon_{ca}$.

If now we postulate $(\epsilon\beta\epsilon)'_1$, it follows that $(\epsilon\beta\gamma)'_1$.

(17) Establish the invalidity of

$(\beta\gamma\gamma)_3$ $(\gamma\beta\gamma)_2$ $(\gamma\gamma\gamma)_4$
$(\gamma\epsilon\gamma)_2$ $(\epsilon\gamma\gamma)_3$ $(\epsilon\epsilon\alpha)_1$

The postulates $(\beta\epsilon\gamma)'_1$ $(\epsilon\beta\epsilon)'_1$ and $(\epsilon\gamma\epsilon)'_3$ that remain (p. 21) may be reduced by the following method:

$(\beta_{ba}\,\beta_{cb} \angle \epsilon'_{ca})'\ (\beta_{cb} \angle \gamma'_{cb}) \angle (\beta_{ba}\,\gamma'_{cb} \angle \epsilon'_{ca})'$

by a principle under vi and the postulate of a preceding exercise

$(\beta_{ba}\,\gamma'_{cb} \angle \epsilon'_{ca})' \angle (\beta_{ba}\,\epsilon_{ca} \angle \gamma_{cb})'$

which yields $(\beta\epsilon\gamma)'_1$ by simple conversion in the major premise.

(18) Establish the invalidity of $(\epsilon\beta\epsilon)_1$ and $(\epsilon\gamma\epsilon)_3$.

Any non-implication of the form $L_{a,b}\ M_{b,c} \angle N_{ca}$, which contains an α-premise, may be reduced to an invalid mood of immediate inference, and so shown to be invalid, by identifying terms in the α-premise. All of the other invalid moods may be derived from the postulates of exercise (12), the forms of immediate implication given in chapter I, the principles iv and vi of chapter III, together with $(xy \angle z) \angle (xz' \angle y')$ and $(xy \angle z) \angle (z'y \angle x')$.

19. From the postulates of exercise (12) deduce all the non-implications of the form $L_{a,b}\ M_{b,c} \angle N_{ca}$, without making use of principles ii and iii of this chapter.

20. Show that there exist no valid implications of the form $L'_{a,b}\ M_{b,c} \angle N_{ca}$ or $L_{a,b}\ M'_{b,c} \angle N_{ca}$ and consequently none of the form $L'_{a,b}\ M'_{b,c} \angle N_{ca}$ or $L'_{a,b}\ M'_{b,c} \angle N'_{ca}$.

CHAPTER IV

§15. The sorites is a form of implication of the general type:*

$$x_1(1,2)\ x_2(2,3)\ x_3(3,4)\text{---}\ x_{n-1}(\overline{n-1},\ n) \angle x_n(n\ 1),$$

in which the number of terms is greater than three.

Certain valid moods of the sorites can be constructed from chains of valid syllogisms. Thus the chain of syllogisms:

$$a(1,2)\ a(2,3) \angle a(31),$$
$$a(31)\ a(3,4) \angle a(41),$$
$$a(41)\ a(4,5) \angle a(51),$$

will yield a valid sorites, viz:

$a(1,2)\ a(2,3)\ a(3,4)\ a(4,5) \angle a(51)$, for
$\{\, a(1,2)\ a(2,3) \angle a(31)\,\} \angle \{\, a(1,2)\ a(2,3)\ a(3,4) \angle a(31)\ a(3,4)\,\}$
$\therefore$ $a(1,2)\ a(2,3)\ a(3,4) \angle a(41)$, by the second syllogism and the principle of transitivity.

$$\{\, a(1,2)\ a(2,3)\ a(3,4) \angle a(41)\,\} \angle$$
$$\{\, a(1,2)\ a(2,3)\ a(3,4)\ a(4,5) \angle a(41)\ a(4,5)\,\}$$
$\therefore$ $a(1,2)\ a(2,3)\ a(3,4)\ a(4,5) \angle a(51)$, as before.

Consequently in general, if

$$x_1(1,2)\ x_2(2,3) \angle x_3(31)$$
$$x_3(31)\ x_4(3,4) \angle x_5(41)$$
$$x_5(41)\ x_6(4,5) \angle x_7(51)$$
$$\cdot\ \cdot\ \cdot\ \cdot\ \cdot\ \cdot\ \cdot$$
$$x_{2n-5}(\overline{n-1\ 1})\ x_{2n-4}(\overline{n-1},\ n) \angle x_{2n-3}(n1)$$

---

*In this chapter it will be more convenient to employ the notation $x(ab)$ for x_{ab} or $x(1,2)$ for $x_{1,2}$. The comma between the terms means that the term order is not settled.

be a chain of valid syllogisms, then

$$x_1(1,2)\ x_2(2,3)\ x_4(3,4)\text{---}\ x_{2n-4}(\overline{n-1},\ n) \angle x_{2n-3}(n1)$$

is a valid mood of the sorites. It remains to be proven that the only valid moods that exist can be constructed from chains of valid syllogisms. The proof depends on the following principles.

Principle i.—A valid mood of the sorites, which has one premise of the same form as the conclusion, will remain valid, when as many of the other premises as we desire are put in the a-form.

Principle ii.—A valid mood of the sorites will remain valid, when as many terms have been identified as we desire.

Principle iii.—An a-premise, whose subject and predicate are identical, may be suppressed as a unit multiplier.

Principle iv.—A valid mood of the sorites, none of whose premises has the same form as the conclusion, will remain valid, when as many premises as we desire are put in the a-form.

Theorem i.—There exists no valid mood of the sorites, in which none of the premises has the same form as the conclusion.

For (principle iv) put all the premises after the first in the a-form. Then by identifying terms (principle ii) the mood of the sorites can be reduced (principle iii) to an invalid syllogism of the form:

$$x_1(1,2)\ a(2,3) \angle x_n(31).$$

Conclusion in the a-form.

At least one of the premises is in the a-form (theorem i). If one of the remaining premises, $x_r(\overline{s-1},\ s)$, be not in the a-form, put each one of the other premises in the a-form,

if all but x_r be not already in that form (principle i). Then by identifying terms (principle ii) the mood of the sorites will reduce (principle iii) to an invalid syllogism of the form:

$$x_r(\overline{s-1}, s)\ \alpha(s, \overline{s+1}) \angle \alpha(\overline{s+1}\ \overline{s-1}),$$
$$\text{or } \alpha(\overline{s-2}, \overline{s-1})\ x_r(\overline{s-1}, s) \angle \alpha(s\ \overline{s-2}).$$

Consequently all the premises are in the α-form if the mood of the sorites is valid and the sorites is of the general type:

$$\alpha(1,2)\ \alpha(2,3)\text{---}\ \alpha(\overline{n-1}, n) \angle \alpha(n1),$$

which can be constructed from the chain of valid syllogisms:

$$\alpha(2,1)\ \alpha(3,2) \angle \alpha(31),$$
$$\alpha(31)\ \alpha(4,3) \angle \alpha(41),$$
$$\alpha(41)\ \alpha(5,4) \angle \alpha(51),$$
$$\cdot\ \cdot\ \cdot\ \cdot\ \cdot\ \cdot\ \cdot\ \cdot\ \cdot$$
$$\alpha(\overline{n-1}\ 1)\ \alpha(n, \overline{n-1}) \angle \alpha(n\ 1).$$

Conclusion in the β-form.

At least one premise, x_t, is in the β-form (theorem i), and all the other premises are in the α-form. For suppose one of the other premises $x_r(\overline{s-1}, s)$ were not in the α-form. Put all the premises (principle i) except x_t and x_r in the α-form. Then by identifying terms (principle ii) the mood of the sorites will be reducible to an invalid syllogism (principle iii) of the form:

$$\beta(\overline{s-1}, \overline{s-2})\ x_r(s, \overline{s-1}) \angle \beta(s\ \overline{s-2}),$$
$$\text{or } x_r(s, \overline{s-1})\ \beta(s, \overline{s+1}) \angle \beta(\overline{s+1}\ \overline{s-1}).$$

Consequently the sorites must be of the form:

$$\alpha(1,2)\ \alpha(2,3)\text{ --- }\alpha(s, \overline{s-1})\ \beta(\overline{s+1}, s)\ \alpha(\overline{s+1}, \overline{s+2})\text{---}\alpha(\overline{n-1}, n)$$

$\angle\ \beta(n\ 1)$, which can be constructed from the chain of syllogisms:

$$\alpha(1,2)\ \alpha(2,3) \angle \alpha(31)$$
$$\alpha(31)\ \alpha(3,4) \angle \alpha(41)$$
$$\cdot\ \cdot\ \cdot\ \cdot\ \cdot\ \cdot\ \cdot$$
$$\alpha(\overline{s-1}\ 1)\ \alpha(\overline{s-1},\ s) \angle \alpha(s\ 1)$$
$$\alpha(s\ 1)\ \beta(s,\ \overline{s+1}) \angle \beta(\overline{s+1}\ 1)$$
$$\beta(\overline{s+1}\ 1)\ \alpha(\overline{s+1},\ \overline{s+2}) \angle \beta(\overline{s+2}\ 1)$$
$$\cdot\ \cdot\ \cdot\ \cdot\ \cdot\ \cdot\ \cdot$$
$$\beta(\overline{n-1}\ 1)\ \alpha(\overline{n-1},\ n) \angle \beta(n\ 1).$$

Conclusion in the γ-form.

At least one of the premises is in the γ-form (theorem i). Each γ-form in the antecedent must present its terms in the order $(s\ \overline{s-1})$. For suppose that $\gamma(\overline{s-1}\ s)$ should appear as one of the premises. Put each one of the remaining premises in the α-form (principle i). Then by identifying terms (principle ii) the sorites will reduce to an invalid syllogism (principle iii) of the form:

$$\gamma(\overline{s-1}\ s)\ \alpha(s,\ \overline{s+1}) \angle \gamma(\overline{s+1}\ \overline{s-1}),$$
or $$\alpha(\overline{s-1},\ \overline{s-2})\ \gamma(\overline{s-1}\ s) \angle \gamma(s\ \overline{s-2}).$$

Pursuing the same reasoning as before it can be shown that no β- or ϵ- premises can occur. One form of this sorites may consequently be $\gamma(21)$--$\gamma(n\ \overline{n-1}) \angle \gamma(n1)$, which can, in fact, be constructed from the chain of valid syllogisms:

$$\gamma(21)\ \gamma(32) \angle \gamma(31)$$
$$\gamma(31)\ \gamma(43) \angle \gamma(41)$$
$$\cdot\ \cdot\ \cdot\ \cdot\ \cdot\ \cdot$$
$$\gamma(\overline{n-1}\ 1)\ \gamma(n\ \overline{n-1}) \angle \gamma(n\ 1).$$

All the other forms of valid sorites with a γ-conclusion are obtained from the above type by transforming one or

more of the premises into the α-form in every possible way under the restrictions of theorem i. Each one of these types can be built up from a chain of valid syllogisms each member of which has one of the forms:

$$(\gamma\gamma\gamma)_{1},\ (\alpha\gamma\gamma)_{1,2},\ \text{or}\ (\gamma\alpha\gamma)_{1,3}.$$

Conclusion in the ϵ-form.

At least one of the premises is in the ϵ-form (theorem i), and there is not more than one ϵ-premise. For, if there are two or more ϵ-premises, put all the premises but two of the ϵ-premises in the α-form (principle i). Then by identifying terms (principle ii) we will come upon an invalid syllogism (principle iii) of the form:

$$\epsilon(\overline{s-1},\ s)\ \ \epsilon(s,\ \overline{s+1}) \angle\ \epsilon(\overline{s+1}\ \ \overline{s-1}).$$

There can be present no β-premise. For suppose $x_r\ (s,\ \overline{s-1})$ to be a β-premise. Put all the premises except x_r and the ϵ-premise in the α-form (principle i). By identifying terms (principle ii) we will come upon an invalid syllogism (principle iii) of the form:

$$\beta(s,\ \overline{s-1})\ \ \epsilon(s,\ \overline{s+1}) \angle \epsilon(\overline{s+1}\ \ \overline{s-1}),$$

or

$$\epsilon(\overline{s-1},\ \overline{s-2})\ \ \beta(s,\ \overline{s-1}) \angle\ \epsilon(s\ \overline{s-2}).$$

Any γ-premise coming after the ϵ-premise must present its terms in the order $(s\ \overline{s-1})$. For suppose $\gamma(s,\ \overline{s-1})$ coming after the ϵ-premise to present the term order $(\overline{s-1}\ s)$. Put all the premises except $\gamma(\overline{s-1}\ s)$ and the ϵ-premise in the α-form (principle i). Then by identifying terms (principle ii) we will come upon an invalid syllogism (principle iii) of the form:

$$\epsilon(\overline{s-1},\ \overline{s-2})\ \ \gamma(\overline{s-1}\ s) \angle\ \epsilon(s\ \overline{s-2}).$$

Any γ-premise coming before the ϵ-premise must present its terms in the order $(\overline{s-1}\ s)$. For suppose $\gamma(s,\ \overline{s-1})$

coming before the ϵ-premise to present the term order $(s\ \overline{s-1})$. Put all the premises except $\gamma(s\ \overline{s-1})$ and the ϵ-premise in the α-form (principle i). Then by identifying terms (principle ii) we will come upon an invalid syllogism (principle iii) of the form:

$$\gamma(s\ \overline{s-1})\ \epsilon(s,\ \overline{s+1}) \angle\ \epsilon(\overline{s+1}\ \overline{s-1}).$$

One form of this sorites may be, consequently,

$\gamma(12)\quad \gamma(23)\text{---}\gamma(\overline{s-2}\ \overline{s-1})\quad \epsilon(s,\ \overline{s-1})\quad \gamma(\overline{s+1}\ s)\text{---}\gamma(n\ \overline{n-1}) \angle\ \epsilon(n\ 1)$, which can, in fact, be constructed from the chain of valid syllogisms:

$$\gamma(12)\ \gamma(23) \angle\ \gamma(13)$$
$$\gamma(13)\ \gamma(34) \angle\ \gamma(14)$$
$$\cdot\quad \cdot\quad \cdot\quad \cdot\quad \cdot\quad \cdot$$
$$\gamma(1\ \overline{s-2})\ \gamma(\overline{s-2}\ \overline{s-1}) \angle\ \gamma(1\ \overline{s-1})$$
$$\gamma(1\ \overline{s-1})\ \epsilon(s,\ \overline{s-1}) \angle\ \epsilon(s\ 1)$$
$$\epsilon(s\ 1)\ \gamma(\overline{s+1}\ s) \angle\ \epsilon(\overline{s+1}\ 1)$$
$$\cdot\quad \cdot\quad \cdot\quad \cdot\quad \cdot\quad \cdot\quad \cdot\quad \cdot\quad \cdot$$
$$\epsilon(\overline{n-1}\ 1)\ \gamma(n\ \overline{n-1}) \angle\ \epsilon(n\ 1)$$

All the other forms of valid sorites with an ϵ-conclusion are obtained from the above type by replacing one or more of the γ-forms by α-forms in every possible way. Each new type can be constructed from a chain of valid syllogisms, each member of which has one of the forms:

$$(\alpha\,\epsilon\,\epsilon)_{1,2,3,4},\ (\epsilon\alpha\,\epsilon)_{1,2,3,4},\ (\gamma\,\epsilon\,\epsilon)_{2,4},\ (\epsilon\gamma\,\epsilon)_{1,2}.$$

There exist, consequently, no valid moods of the sorites which can not be constructed from chains of valid syllogisms.*

---

*If $(\gamma\,\epsilon\,\epsilon)_{2,4}$ and $(\epsilon\gamma\,\epsilon)_{1,2}$ are to be regarded as invalid moods, (see the concluding remarks of chapter III), then it can be shown at once that no γ-premise can occur when the conclusion is in the ϵ-form. The general form of such a sorites will be,

EXERCISES

(1) Construct a valid sorites from the chain of valid syllogisms:

$$\alpha_{21}\,\gamma_{32} \angle \gamma_{31},$$
$$\gamma_{31}\,\alpha_{43} \angle \gamma_{41},$$
$$\gamma_{41}\,\gamma_{54} \angle \gamma_{51}.$$

(2) By the aid of the principles of chapter IV, reduce the valid sorites, $\alpha_{21}\,\gamma_{32}\,\alpha_{43}\,\gamma_{54} \angle \gamma_{51}$, successively to each one of the three valid syllogisms of example 1.

(3) Prove the invalidity of the sorites,

$$\gamma_{21}\,\gamma_{32}\,\gamma_{34}\,\gamma_{54} \angle \gamma_{51}.$$

(4) From what chain of valid syllogisms can the sorites, $\alpha_{1,2}\,\gamma_{23}\,\epsilon_{3,4}\,\gamma_{54}\,\alpha_{6,5} \angle \epsilon_{61}$ be constructed?

(5) If $(\epsilon\gamma\epsilon)_{1,2}$ and $(\gamma\,\epsilon\,\epsilon)_{2,4}$ be regarded as invalid moods of the syllogism, (see the concluding remarks of chap. III), prove the invalidity of the sorites,

$$\gamma_{12}\,\gamma_{23}\cdots\gamma_{s-2\,s-1}\;\epsilon_{s,\,s-1}\,\gamma_{s+1\,s}\cdots\gamma_{n\,n-1} \angle \epsilon_{n1}$$

$\alpha(1,2)\,\alpha(2,3)\cdots\alpha(\overline{s-1},\,s)\,\epsilon\,(s,\,\overline{s+1})\,\alpha\,(\overline{s+1},\,\overline{s+2})\cdots\alpha\,(\overline{n-1},\,n) \angle \epsilon(n1)$

which can be built up from the chain of syllogisms,

$\alpha(1,2)\alpha(2,3) \angle \alpha(31)$

$\alpha(31)\alpha(3,4) \angle \alpha(41)$

. . . . . .

$\alpha(\overline{s-1}\;1)\alpha(\overline{s-1},\,s) \angle \alpha(s1)$

$\alpha(s1)\,\epsilon\,(s,\,\overline{s+1}) \angle \epsilon(\overline{s+1}\;1)$

$\epsilon\,(\overline{s+1}\;1)\,\alpha\,(\overline{s+1},\,\overline{s+2}) \angle \epsilon\,(\overline{s+2}\;1)$

. . . . . .

$\epsilon(\overline{n-1}\;1)\,\alpha(\overline{n-1},\,n) \angle \epsilon\,(n\;1)$

APPENDIX I

On the Simplification of Categorical Expression and the Reduction of the Syllogistic Figures

If a and b represent classes, there are four ways in which they may be related categorically, the one standing for subject, the other for predicate. These four forms of relationship are always represented by the letters, A, E, I, O, i. e.

A_{ab} = all a is b,
E_{ab} = no a is b,
I_{ab} = some a is b,
O_{ab} = not all a is b.

Historical efforts have been made to reduce the number of these relationships. If symbols be invented to denote *some* a (ă) and not-a (a_1), the last three may be represented by means of the first, for:

$$E_{ab} = A_{ab1},\ I_{ab} = A_{\breve{a}b},\ O_{ab} = A_{\breve{a}b1}.$$

But an essential difference is here left undistinguished and the number of necessary forms will not have been reduced by this device. If a new symbol be employed for *all* a (ā) and another for the copula *is* ($\angle$), we shall have:

$A_{ab} = \bar{a} \angle \breve{b}$,
$E_{ab} = \bar{a} \angle \breve{b}_1$,
$I_{ab} = \breve{a} \angle \breve{b}$,
$O_{ab} = \breve{a} \angle \breve{b}_1$.

The four separate categorical forms have, accordingly, been gotten rid of at the cost of introducing four new undefined symbols, so that no economy of our indefinables has been effected.

It is to be observed that the word *some*, which is implicit or explicit in the meaning of part of each proposition, means *some at least, possibly all.* Another set of propositions, in which *some* is to mean *some at least, not all*, may be used to replace the traditional ones. These other forms are:

α_{ab} = all a is all b,
β_{ab} = some a is some b,
γ_{ab} = all a is some b,
ϵ_{ab} = no a is b.

In addition we shall have to employ

the *hypothetical* form,

$x_{ab} \angle y_{ab} = x_{ab}$ implies y_{ab},
$\{x_{ab} \angle y_{ab}\}' = x_{ab}$ does not imply y_{ab},

the *conjunctive* form,

$x_{ab} \cdot y_{ab} = x_{ab}$ and y_{ab},

the *disjunctive* form,

$x_{ab} + y_{ab} = x_{ab}$ or y_{ab}.

Each member of the set, A, E, I, O, may be expressed in the members of the set, α, β, γ, ϵ, and conversely, so that the two are, in fact, logically equivalent, although each one has certain advantages peculiar to itself.

The members of the second set have this property, that, if one is true, then all the others are false.* We assume, accordingly, the

Postulates: $\alpha_{ab} \angle \beta'_{ab}$ $\beta_{ab} \angle \gamma'_{ab}$ $\gamma_{ab} \angle \gamma'_{ba}$
$\alpha_{ab} \angle \gamma'_{ab}$ $\beta_{ab} \angle \epsilon'_{ab}$
$\alpha_{ab} \angle \epsilon'_{ab}$ $\gamma_{ab} \angle \epsilon'_{ab}$

*Provided we exclude the limiting values 0 and 1 for a and b. The ordinary definitions of these limits allow γ_{01} and ϵ_{01} be true together.

from which follow, by the principle of the denial of the consequent, the

Theorems:

$$\epsilon_{ab} \angle \alpha'_{ab} \qquad \gamma_{ab} \angle \alpha'_{ab}$$
$$\epsilon_{ab} \angle \beta'_{ab} \qquad \gamma_{ab} \angle \beta'_{ab}$$
$$\epsilon_{ab} \angle \gamma'_{ab} \qquad \beta_{ab} \angle \alpha'_{ab}$$

Consequently*

$$\alpha_{ab} \cdot \beta_{ab} = 0 \qquad \beta_{ab} \cdot \gamma_{ab} = 0 \qquad \gamma_{ab} \cdot \gamma_{ba} = 0$$
$$\alpha_{ab} \cdot \gamma_{ab} = 0 \qquad \beta_{ab} \cdot \epsilon_{ab} = 0$$
$$\alpha_{ab} \cdot \epsilon_{ab} = 0 \qquad \gamma_{ab} \cdot \epsilon_{ab} = 0 \qquad \text{I}$$

From the *Definitions:***

$$A_{ab} = \alpha_{ab} + \gamma_{ab}$$
$$E_{ab} = \epsilon_{ab}$$
$$I_{ab} = \alpha_{ab} + \beta_{ab} + \gamma_{ab} + \gamma_{ba} \qquad \text{II}$$
$$O_{ab} = \epsilon_{ab} + \beta_{ab} + \gamma_{ba}$$

we obtain immediately***

$$\alpha_{ab} = A_{ab} \cdot A_{ba}$$
$$\beta_{ab} = I_{ab} \cdot O_{ab} \cdot O_{ba}$$
$$\gamma_{ab} = A_{ab} \cdot O_{ba}$$
$$\epsilon_{ab} = E_{ab}$$

It is an advantage of the forms of the original set, an advantage which the set, α, β, γ, ϵ, does not possess, that the contradictory of any letter is represented by a single other letter of the set. Suppose that we were to

---

*$\alpha\ \beta = 0$ reads: α(*is true*) *and* β(*is true*) is *impossible.*

**A, E, I, O are simply the sums given in equations II. That they are the traditional Aristotelian forms, is only an accident of the reader's application. Hence equations II are definitions and not postulates.

***Multiplying out the sums in II as if they were ordinary polynomials, applying the results of I, and assuming that α, β and ϵ are simply convertible.

combine this advantage with that of simple convertibility in a new set of forms.

To do this it would seem to be enough to subtract from the meaning of A_{ab} the part γ_{ab}, (equations II), and to add this part to the meaning of O_{ab}.* Our new set of forms becomes:

$$\begin{aligned} a_{\imath ab} &= a_{ab} \\ \epsilon_{\imath ab} &= \epsilon_{ab} \\ \iota_{\imath ab} &= a_{ab} + \beta_{ab} + \gamma_{ab} + \gamma_{ba} \\ o_{\imath ab} &= \epsilon_{ab} + \beta_{ab} + \gamma_{ab} + \gamma_{ba} \end{aligned} \qquad \text{III}$$

the analogues of the old letters being represented by the corresponding Greek vowels.

From equations I and III, and remembering that the sum of a_{ab}, β_{ab}, γ_{ab}, ϵ_{ab}, γ_{ba} makes up the propositional "universe," the results of the following table, yielding all the moods of immediate inference, will easily be seen to hold.

True	*Implies the truth of only*	*Implies the falsity of only*	*False*	*Implies the truth of only*	*Implies the falsity of only*
a	a, ι	ϵ, o	a	o	a
ϵ	ϵ, o	a, ι	ϵ	ι	ϵ
ι	ι	ϵ	ι	ϵ, o	a, ι
o	o	a	o	a, ι	ϵ, o

An induction of these results shows that $a = o'$, $o = a'$, $\epsilon = \iota'$, $\iota = \epsilon'$, and that, consequently, *contradictory*

*Here would seem to be another instance of the manner in which the language of symbols may free a science from the accidents imposed upon its development by the language of speech. The last two members of the new set have apparently no simple verbal expression.

pairs are a, o and ϵ, ι. Likewise *contraries* are a, ϵ; *subcontraries* are ι, o; *subalterns* are a, ι and ϵ, o.

If we define an *affirmative* form as one that becomes unity when subject and predicate have been identified and a *negative* form as one that becomes unity when subject and predicate have been made contradictory, then it is a result of the following

*Postulates:** a_{aa} is a true proposition,
$\epsilon_{a\bar{a}}$ " " " "

Theorems: β'_{aa} " " " "
γ'_{aa} " " " "
ϵ'_{aa} " " " "
$a'_{a\bar{a}}$ " " " "
$\beta'_{a\bar{a}}$ " " " "
$\gamma'_{a\bar{a}}$ " " " "

and equations III, that a and ι are affirmative and that ϵ and o are negative forms.

If a *distributed* term be one modified by the quantitative adjective *all*, it will be seen that a and ϵ distribute both subject and predicate, while ι and o distribute neither. These results are summarized in the table below, the distributed terms being underlined.

	Affirmative	*Negative*
Universal	$a_{\underline{ab}}$	$\epsilon_{\underline{ab}}$
Particular	ι_{ab}	o_{ab}

*x *is true* is to be represented by $x=1$, x *is false* by $x=0$. (See Boole, Investigation of the Laws of Thought, ch. XI, p. 169). The theorems follow by equations I, and equations III become as a result of them, $\alpha_{aa}=1$, $\epsilon_{aa}=0$, $\iota_{aa}=1$, $o_{aa}=0$, $\alpha_{a\bar{a}}=0$, $\epsilon_{a\bar{a}}=1$, $\iota_{a\bar{a}}=0$, $o_{a\bar{a}}=1$. Employing the usual notation, $\bar{a}$ = not-a.

The traditional rules for detecting the invalid moods of the old syllogism, constructed from the set A, E, I, O, hold for the new syllogism, built up out of the forms, a, ϵ, ι, o. These rules are:

1. Two negative premises do not imply a conclusion. *Ex.* $\epsilon_{ba}\,\epsilon_{cb} \angle \epsilon_{ca}$.

2. Two affirmative premises do not imply a negative conclusion. *Ex.* $a_{ba}\,a_{cb} \angle \epsilon_{ca}$.

3. An affirmative and a negative premise do not imply an affirmative conclusion. *Ex.* $a_{ba}\,\epsilon_{cb} \angle a_{ca}$.

4. Two premises, in neither of which the middle term is distributed, do not imply a conclusion. *Ex.* $\iota_{ba}\,\iota_{cb} \angle \iota_{ca}$.

5. Two premises, in which a given term occurs undistributed, do not imply a conclusion, in which that same term is distributed. *Ex.* $a_{ba}\,\iota_{cb} \angle a_{ca}$.

The valid moods which remain, and which of course are valid in all four figures, since each one of the forms is simply convertible, are twelve in number, viz:

aaa	$aa\iota$	$a\epsilon\epsilon$	$a\epsilon o$
$a\iota\iota$	aoo	$\epsilon a\epsilon$	ϵao
$\iota a\iota$	oao	$\epsilon\iota o$	$\iota\epsilon o$

It has been previously observed, (note p. 2), that equations I hold generally only when the limits 0 and 1 are excluded as possible values of a and b. If these possibilities he included, we shall have to assume:

$\{\gamma_{ab} \angle \epsilon'_{ab}\}'$ and $\therefore \{\epsilon_{ab} \angle \gamma'_{ab}\}'$, since $\gamma_{01}\,\epsilon_{01} \neq 0$.
Equations I then become:

$$\begin{aligned} &a_{ab} \cdot \beta_{ab} = 0 && \beta_{ab} \cdot \gamma_{ab} = 0 \\ &a_{ab} \cdot \gamma_{ab} = 0 && \beta_{ab} \cdot \epsilon_{ab} = 0 \qquad \text{IV} \\ &a_{ab} \cdot \epsilon_{ab} = 0 && \gamma_{ab} \cdot \epsilon_{ab} \neq 0 \end{aligned}$$

Under these conditions, the fact which the old logic always took for granted, that E_{ab} is the contradictory of I_{ab}, and A_{ab} the contradictory of O_{ab}, no longer holds true. For, while the sum of each of these two pairs of forms is the propositional universe, their product is not the propositional null, (equations II, IV). In order that $E_{ab} \cdot I_{ab}$ and $A_{ab} \cdot O_{ab}$ shall vanish for all values of the terms, it will be necessary to exclude $\gamma_{ab}\ \epsilon_{ab}$ from the product. A new set of forms, in which part of the meaning of ι_{ab} is subtracted from ι_{ab} and added to ϵ_{ab}, will satisfy this requirement. Let this new set be:

$$
\begin{aligned}
a_{2ab} &= a_{ab} \\
\epsilon_{2ab} &= \epsilon_{ab} + \gamma_{ab} + \gamma_{ba} \\
\iota_{2ab} &= a_{ab} + \beta_{ab} \\
o_{2ab} &= \epsilon_{ab} + \beta_{ab} + \gamma_{ab} + \gamma_{ba}
\end{aligned}
\qquad \text{V}
$$

If a, ϵ, ι, o, be replaced by a_2, ϵ_2, ι_2, o_2, respectively in the table, (p. 38), all the results of such a new tabulation will be seen to hold, (equations IV, V). The same definitions as given before will make a_2 and ι_2 affirmative, ϵ_2 and o_2 negative forms, (equations V, and the postulates and theorems, p. 39), but since ϵ_2 distributes neither subject nor predicate, $\epsilon_2\ \iota_2\ o_2$ and $\iota_2\ \epsilon_2\ o_2$ will not be found among the valid moods of the syllogism, (see p. 40). The same rules (p. 40) for the detection of the invalid moods will hold for the new syllogism, but rule 1 is now redundant, being a corollary of rule 4.

It might perhaps appear that our original symmetry, (that of equations I), which was interrupted by the necessity of allowing γ_{01} to stand as a true proposition, could be saved by assuming that the null class exhausts no part of the universe, i. e. *all of nothing is some of everything*, might be regarded as a false proposition. Now $A_{0a} = 1$,

or $a_{oa} + \gamma_{oa} = 1$, is Schröder's definition of the null class, and A_{oa} will be a true proposition for all values of a if $\gamma_{oı}$ be true, whereas, $\gamma_{oı} = 0$ involves $A_{oı} = 0$. These consequences lead us to the alternatives of either giving up our symmetry, (in equations I), or else of regarding the null class as not essential to our algebra.

It is finally to be noted—what was obvious in the beginning—that, while the members of the set, a, ϵ, ι, o, can be expressed in the members of the set, a, β, γ, ϵ, the latter can not be expressed in the former. Consequently, an essential difference has been lost, and the existence of a completed logic of the new forms would not put aside the necessity of working out the logic of the old.

The attempts of the logician to discover a set of categorical forms, which establish a complete symmetry among the moods and figures of the syllogism, are as old as the science itself. The end would be attained if a new set could be selected so as to satisfy the following conditions:

1. Each form of the set must be simply convertible.
2. Corresponding to any member of the set, there must occur another which represents its contradictory.
3. The new set must yield at least one valid mood of the syllogism.
4. Each member of the new set must be representable in the members of a set already proved necessary and sufficient to express all differences, (the set A, E, I, O, say), and conversely.

If x_{ab} be any categorical form, the simplest functions of x, which are themselves categorical and which are in general simply convertible, are $x_{ab} \cdot x_{ba}$ and $x_{ab} + x_{ba}$. It will be enough, therefore, in order to satisfy condition 1,

to assume as a new set of forms either such a sum or such a product of each one of the old forms (A, E, I, O, say).

The equation, $\{x_{ab} \cdot x_{ba}\}' = x'_{ab} + x'_{ba}$, suggests at once what our manner of satisfying condition 2 must be, for since the product, $x_{ab} \cdot x_{ba}$ is the contradictory of the sum $x'_{ab} + x'_{ba}$ and x the contradictory of x', if $x_{ab} + x_{ba}$ [respectively $x_{ab} \cdot x_{ba}$] be chosen as one of our new forms, $x'_{ab} \cdot x'_{ba}$ [respectively $x'_{ab} + x'_{ba}$] must be chosen as one of the others.

Remembering that

$$E_{ab} = E_{ab} \cdot E_{ba} = E_{ab} + E_{ba},$$

and $I_{ab} = I_{ab} \cdot I_{ba} = I_{ab} + I_{ba},$

and that $E_{ab} = I'_{ab}$ and $I_{ab} = E'_{ab},$

it follows that our choice of a new set of forms is limited to the following two:

$$A_1 = A_{ab} \cdot A_{ba}, \quad E_1 = E_{ab}, \quad O_1 = O_{ab} + O_{ba}, \quad I_1 = I_{ab}, \tag{1}$$

$$A_2 = A_{ab} + A_{ba}, \quad E_2 = E_{ab}, \quad O_2 = O_{ab} \cdot O_{ba}, \quad I_2 = I_{ab}. \tag{2}$$

It will be found, however, that the set (2) yields no valid moods of the syllogism. Consequently, applying condition 3, our choice is seen to be unambiguously restricted to set (1), which yields twelve moods, valid each one in each of the four figures. These will be found to be, (dropping the subscripts):

A A A,	A A I,	A E E,	A E O,
A I I,	A O O,	E A E,	E A O,
I A I,	O A O,	E I O,	I E O.

It will be impossible, however, to satisfy condition 4, since every expression involving the new forms will be

simply convertible. Consequently, an essential difference has been left undistinguished, and it will not be possible to substitute the new forms for the old. The new forms are, in fact, identical with a_I, ϵ_I, ι_I, o_I, considered above.

From this latter discussion and from the discussion that has gone before, we conclude, that, if it be necessary to retain in our set of forms at least one that is not simply convertible, it will be impossible to satisfy the condition 2 above, unless the null-and one-class be excluded or defined in some way other than ordinary.

APPENDIX II

Historical Note on De Morgan's New Propositional Forms

In introducing the notion of contradictory terms into logic De Morgan discovered two new propositional forms, which cannot be directly expressed by means of the A, E, I, O relations of traditional logic.* Suppose that we denote these two forms by U and V, i. e.

U (ab) = All not a is b,
V (ab) = Some not a is not b,
A (ab) = All a is b,
E (ab) = No a is b,
I (ab) = Some a is b,
O (ab) = Some a is not b.

U and V are simply convertible, for (if $\bar{a}$ = not-a) U(ab) = A ($\bar{a}$b) = A ($\bar{b}$a) = U (ba), (converting in A by the principle of contraposition), and

V (ab) = I ($\bar{a}\bar{b}$) = I ($\bar{b}\bar{a}$) = V (ba), (converting simply in I).

V distributes both subject and predicate while U distributes neither, for V(ab) = O($\bar{a}$b) = O($\bar{b}$a) (converting in O by contraposition) and, since O distributes its predicate, both a and b are distributed terms; similarly U(ab) = A($\bar{a}$b) = A($\bar{b}$a) (converting in A by contraposition) and, since A does not distribute its predicate, a and b are undistributed terms.

If an affirmative form be defined as one that becomes the subcontrary of itself when the subject and predicate

*Formal Logic, p. 61.

have been identified, and a negative form as one that becomes the contrary of itself under the same conditions, it will be seen that A, I and V are affirmative, that E, O and U are negative forms.

These results are summarized in the following table, the distributed terms being underlined.

	Affirmative	*Negative*
Universal	A(a̲b̲)	E(a̲b̲)
Particular	I(ab)	O(ab̲)
Indefinite	V(a̲b̲)	U(ab)

Below are tabulated all the forms of immediate implication which hold among the six propositions A, E, I, O, U, V. The (144) implications and non-implications necessary to establish unambiguously the results of the table can be derived from a certain number of postulates and the commonly assumed principles of traditional logic.

True	*Implies falsity of*	*Implies truth of*	*False*	*Implies falsity of*	*Implies truth of*
A	E, O, U.	A, I, V.	A	A.	O.
E	A, I.	E, O.	E	E.	I.
I	E.	I.	I	A, I.	E, O.
O	A.	O.	O	E, O, U.	A, I, V.
U	A, V.	O, U.	U	U.	V.
V	U.	V.	V	A, V.	O, U.

An induction of these results will show that:
Contradictory pairs are: A, O; E, I; U, V;
Contrary pairs are: A, E; A, U;

UNIV. OF CALIFORNIA

Subcontrary pairs are: I, O; O, V;
Subalternate pairs are: A, I; A, V; I, V; I, U; E, O; E, U; E, V; U, O.

In order to show how the new forms fit the ancient scheme and as an illustration of method let us solve the array of the syllogism. We first observe (see table) that A weakens ambiguously to I or V; that O strengthens ambiguously to E or U.*

Rules:

1. In any valid mood interchange either premise and the conclusion and replace each by its contradictory.
2. In any valid mood strengthen a premise or weaken a conclusion.
3. In any valid mood convert simply in any form but A or O.

Postulates:

A A A (1st figure) is a valid mood.
A U U (" ") " " " "
E A E (" ") " " " "
U E A (" ") " " " "

From these rules and postulates will follow sixteen valid moods in the 1st figure, twenty in each one of the 2nd and 3rd figures, and twenty-one in the 4th figure.

In order to deduce the invalid moods let us assume the

Rules:

1. In any invalid mood interchange either premise and the conclusion and replace each by its contradictory.

---

*If x implies y but y does not imply x, then x is said to be a *strengthened* form of y, and y is said to be a *weakened* form of x.

2. In any invalid mood weaken a premise or strengthen a conclusion.

3. In any invalid mood convert simply in any form but A or O; and

Postulates:

A A A (4th figure) is an invalid mood.
A A O (" ") " " " "
A A V (3rd ") " " " "
A A I (2nd ") " " " "
A A O (1st ") " " " "
E E I (" ") " " " "
E E O (" ") " " " "
E U A (" ") " " " "
E U O (" ") " " " "
U U O (" ") " " " "
U U V (" ") " " " "

From these postulates and rules follow the remaining (772) invalid moods.

It will be seen at once that the rules of the old logic for the immediate detection of the invalid moods of the syllogism no longer hold. To give only one illustration: A term may appear distributed in the conclusion of a valid mood and be undistributed in the premise.

PREFACE.

THIS Manual of Logic is humble in its size, and form of publication; but in its *principles* it pretends to originality, and in its *purpose* to interfere with doctrines that have been advocated by some of the profoundest teachers of our kind. I wish, therefore, in this preface, to excuse such presumption as this very statement carries with it, and to soften, as well as I can, the prejudice which I may raise by making it.

First, then, for my pretensions to originality. I think I have the good fortune to start, in this work, with a few self-evident, or nearly self-evident principles, which have been overlooked by all who have gone before me in this department of learning. What they are, and how they affect the kind of instruction here proposed, will appear on an examination of the work; but I may as well indicate them at present, in order that the critical examiner may be prepared to trace their effect in the detail which follows. In the first place, I think it all but self-evident, if not quite so, that every single word competently used, is the sign of *knowledge*, and that, in calling it the sign of an *idea*, we either mean the same thing, or we have no distinct, definite meaning

M314157

in so using the term *idea*. Secondly, it appears to me another self-evident truth, that every act of the natural understanding which increases or which develops our knowledge, involves three things,—the thing newly-known or newly-recognized; the thing or things in some relation to it, by being aware of which relation, it *is* newly, or better known; and the knowledge itself; which knowledge it is the privilege of our species to entertain separately, (apart, abstractly,) so as to be applicable to other things hypothetically, in order, by inquiry, to push our knowledge further. If to others, as to myself, this statement should not convey a self-evident truth, I believe the obstruction to be no other than will be removed by the examples, furnished in various places throughout this work. Thirdly, it appears also self-evident to me, and, with less difficulty than attends the previous statement, will I think, appear evident to others, that words which join to make sense, lose their separate (their more abstract) meaning, in a meaning which they unite to signify; so that the longest expression which can be formed by words that, in this manner, make sense, are but as one single word, with reference to the sense which is thus attained and signified.

Such are the principles,—few, simple, and self-evident, or very nearly so,—which have nevertheless been overlooked, or at least, not considered up to their full weight, by those who have formed systems of logic, especially by Aristotle and his followers; by those who, in any past days, have

speculated on the laws of human thought, and on the origin, the nature, and possible compass of human knowledge. I take these principles with me in the execution of the little work which follows; with what success must be judged by its contents.

But while I speak thus confidently of the ground I take, I feel, and am ready to acknowledge, with deep humility, the imperfections that must be discovered in what I have done to build upon it. It is one thing to plan, and another to execute; and every-one, even from the size of my volume will be ready at once to say, *Parturiunt montes, nascitur,* &c.

There is another preconceived objection, which, I cannot help feeling, will stand in my way. I am nobody. I belong to no learned body. I have previously produced nothing that the world has much regarded. May I be permitted, without the charge of unnecessarily speaking of myself, to make such a statement, as, with impartial persons, will, I trust, have some weight against this objection.

A man can but do what the short space of life allows; and if his time has not been occupied in pursuits adverse to, and calling him away from some one pursuit in which he takes an interest, he may achieve, in that one pursuit, as much as another; —he may achieve much more than others of far greater natural powers, if he comes after them, and takes up what they have begun, but left unfinished. Such, I believe to be my predicament. Nor do I come forward for the first time, with the fruits of my inquiries. Twenty years ago, I published in

theory what I now offer in a practical work; having had abundant opportunity, in the intervening years, of testing, with pupils of various age, and of every degree of competency, the effect of such instruction as the following pages contain.

And now, if it be asked what sect or denomination of past teachers in logic and speculative science I adhere to,—I answer, to none. I have endeavoured to keep clear of all *extremes* in opinion:—I am not a Sensationalist with the French philosophers; I am not an Idealist with the German: I give no countenance to Materialism; and I hold not, with Berkeley, that there is nothing outward to the mind. I am not of the Scottish school; for I see no *scientific* ground for a Philosophy of the Mind in contradistinction to a Philosophy of Matter, or as a part of the Philosophy of Man, yet fitted to be treated distinctly from Man. I wonder therefore that Mr. MORELL, in his able History of Modern Philosophy, should have placed me among the *Scoto*-English Metaphysicians. The following pages will, I think, take me out of that category, and leave me purely English.

On points transcending Philosophy, I do not declare my creed; for those are points that lie beyond the limits of such a work as this; and I think the cause of religion is never served by *forcing* religious considerations into science of human origin. The structure built from the earth, ought indeed to prove its own truth by meeting and coinciding with truth that comes from the skies; and it must

coincide either now or eventually; for He who gives the light from above, also gives the power to raise the edifice from below. It is happy for me that what I happen to have reached, or imagine I have reached, of truth in these pages, does not, in any part, stand in contradiction to the doctrines of the Bible.

Something remains by way of advertisement to my Readers. I have placed in the Index at the end, some points that I was glad to exclude from the body of the work:—for instance, under the word Locke, I have indicated in what manner both Locke and Horne Tooke, after beginning well, went completely astray. I conceive myself nevertheless to be a follower of those two men; and only hope I have escaped the errors of my masters. If I have not been able thus to avoid other controversial points in making up what I intend for a practical work, yet I have so placed the more abstruse matter, that the learner may quite avoid it in pursuing his first Course of instruction. For his guidance, and that of the teacher who may not have time and opportunity to extract a better plan, I have given an Outline for a First Course of Logic in the Appendix. Under *Philosophy, Philosophers,* in the Index, I have furnished a brief memorial of the changes in speculative opinion among the Greeks, and a still slighter intimation of the movement of such opinion into times comparatively modern. Should the reader desire an account to the same purpose, something

more extended, and much more elegantly stated, he will find it in the "Philosophy of the Mind," by Mr. J. Douglas of Cavers. If he should wish to know, beyond what he can learn from the hints scattered in this Manual, the state of Speculative Philosophy at the present day, he cannot do better than consult Mr. Morell's History previously alluded to. And if my meagre allusion, in the Index, to Schoolmen and Scholastic learning, should raise a desire to know more, Mr. Hallam's Introduction to the Literature of Europe, and Dr. Whewell's two works, the History, and the Philosophy, of the Inductive Sciences, will supply all that can be needed.

MANUAL OF LOGIC.

CHAPTER I.

OUTLINE THEORY OF LOGIC.

1. Logic is a branch of learning connected with Grammar and Rhetoric. While Grammar looks only to correctness of *construction*, or properly putting the parts of speech together so that they shall be accurate *forms* of language; and Rhetoric varies those forms in order to make them expressive of *emotion;* Logic looks to the *sense* which language has to convey, clear from any emotion which may, or may not be its effect. The sense of any single word is the knowledge which it signifies; the sense of two or more words put together, is the development of the knowledge included, or assumed to be included, in each of the separate words, and meeting in the more particular knowledge, which the two or more words unite to express. Thus *red* denotes the knowledge of what red is, derived from a great many particular things; *earth* denotes the knowledge of what an earth is, derived in the same way; while *red earth*, which is one expression for one meaning, indicates the development of the previous knowledge in one of the particulars assumed to be already included in the knowledge denoted by each separate word. We may call *red* and *earth* the premises of a conclusion which must rationally follow from their union: we may call *red earth* the conclusion from these premises.

2. The process of the understanding by which knowledge is accumulated and included under a sign, is called *Induction;* the process by which the knowledge so accumulated is spread again before the understanding in words, which being joined together, make evident *sense*, that is to say, make one expression with one meaning, is called *Deduction.*

3. The logical function of a word is one thing; its grammatical function, another: logical completeness is one thing; and grammatical completeness another. Take the four words,

Every man is mortal, separately, and each has a separate meaning; each is the sign of knowledge. The grammatical function is something added to this its logical function; but being added, it has this effect, that we are required not to rest in the meaning of the separate parts, but to go on till a whole is formed out of the parts, and to understand that whole as one expression for one meaning. But logical completeness may, or may not coincide with grammatical completeness. The construction is complete when we say *Every man is mortal;* yet we may go on developing our knowledge in forms of expression grammatically independent of each other, as when we add to the foregoing expression, *Every king is a man.* These two expressions which are grammatically distinct, have the same ground of logical connection as the following two, which are grammatical parts of one construction: *A king like every other man;* and, *Is mortal.* In both instances, the expressions signify premises involving a conclusion. In the former instance, the conclusion must be expressed, like the premises, in a sentence of independent form; *Therefore, every king is mortal.* In the other instance, we have but to put the two grammatical parts together, and the same conclusion will be signified; as, *A king like every other man is mortal.*

4. Every one who learns and uses a language learns and practises logic both *in*ductively and *de*ductively. A book on logic can do nothing more, and therefore ought to propose nothing more, than to assist this practice by unfolding its theory, in order that the practice may, as far as possible, be free from the mistakes and failures, to which all practice is liable, which is unsupported by correspondent theoretical knowledge.

Note to Chapter I.

To any one acquainted with the Science of the formal Syllogism, it will at once appear that the art or practice shadowed out in the previous brief sections, must be a logic distinct from Aristotle's. It is so:—yet it is the logic of our race,—with reference to which fact we may call it OUR logic, the logic in use—that always has been in use by mankind, including the Aristotelians themselves when not occupied within their especial domain. With this declaration, we might pass on, and leave the Aristotelians to themselves, if their science were not asserted to be the theory of *our* logic,—the science of reasoning as it is exercised by all man-

* The pages, on account of the common Index, follow those of the Manual of Rhetoric.

kind through the instrumentality of language. One writer indeed, understood, I believe, to be Sir William Hamilton, profound beyond any man of the present day in scholastic learning, appears to repudiate, although himself an advocate of formal logic, any blending of it with other doctrine, censuring, in a very learned Article of the Edinburgh Review (April 1833) "the attempts lately made to conciliate, to the *declining* study a broader interest than its own." Dr. Whately, then of Oxford, now the Archbishop of Dublin, has eminently succeeded in an attempt thus characterized. Of him, the reviewer says that he is "a very shrewd, and (what is rarer in Oxford) a very independent thinker." The effect of Dr. Whately's Oxford education, joined to his shrewdness and independence of mind, has been this,—that the logic of Aristotle, rejected by philosophy since she succeeded in throwing off the trammels imposed by the schoolmen, has, through him, regained a footing in *some* places,* which, but for him, she had lost for ever, "Oxford," as the reviewer observes, "being the only British seminary where the study of logic-proper" (formal logic) "can be said to have survived." Now as to this logic, we are ready to admit before proceeding further with ours, that it *is* a science, and it *is* an art, but a science and an art quite distinct from our logic, re-asserting that ours is the logic in use by mankind:—and what we have to say of Dr. Whately's treatise, is, that it owes its popularity not to what it contains of Aristotelian logic, but in spite of what it contains, by the excellence of the matter which he erroneously arrogates as a part of that logic. Had his volume presented nothing but what pertains to formal logic, we might have left him to whatever arguments can be found in its favour: but in order to bring it back into respect, he far transcends its proper sphere. First alleging, what is not true, that all reasoning whatever has its foundation in the principle of the formal syllogism, he proceeds to discourse, with admirable intelligence and skill, on the many causes of faulty induction; the notice of which properly belongs only to such a work as the present,—such for instance as the errors imbibed through the instrumentality of language, the force of prejudice on our thoughts, the crudities engendered by imperfect systems; which kind of matter we affirm to have no proper place within the limits of formal logic. How true an observation is the following! "A fallacy which, stated barely, would not deceive even a child, may deceive half the world when diluted into a volume." (Logic: Of Fallacies, III. § 6.) Of the soundness of this remark, it would not be easy to find a better instance than Dr. Whately's own volume. Let the logic of Aristotle stand separate and alone, and it cannot be saved from the neglect into which it was confessedly falling: dilute it through the excellent, but distinct matter, which forms the bulk of Dr. Whately's volume, and half the world are inclined in its favour. Of the half world thus biassed, one part will be incapable, and the rest indisposed, that is too idle, to dissipate the superinduced error; for, as Dr. Whately says in another place, "there is probably not one person in ten, who is physically capable of the degree of steady application requisite for embracing the principles of logic, or any other science; and, a much

* Wonderful to say, chiefly in America, the country celebrated for *going-a-head.*

greater number to whom this, though not an impossibility, is a very great difficulty." (Preface—early editions.) Thus, then, it is *possible* that Dr. Whately's "Logic," may have acquired a temporary popularity, in spite of a radical defect, which, when known, must vitiate the whole as a system, though what is unfairly made a part of that system cannot be deprived of its independent merit. And this *possible* defect we assert to be *actual*. The formal syllogism, which he makes the basis of his system, is not the basis of all reasoning. It is a purely *grammatical* contrivance for reducing every other form of expression to one single form, without any change of the mental act by which the knowledge signified was received. The things of sense inevitably suggest unnumbered relations to the understanding:—the following is only one of them,—that if a thing is contained in or under another, and this under a third, the first is contained under the third. But so plastic is language by the possible variation of terms, of propositions, and of larger forms of discourse, (all of which differ as *grammatical* forms only, without corresponding differences in the reasoning mind,) that we can, if we please, express any other understood relation, in the form strictly appropriate to one; through which possibility, we have a science, of which the enunciation of the one particular relation referred to above, is the axiom, while the art, (a purely grammatical art,) is the reduction of every expression to the one form, that so the axiom may be applied to it, and a demonstration scientifically ensue. In all cases this will be a demonstration of what is already *inevitably* understood;—as Dugald Stewart says,—the demonstration of a demonstration; and the practice will be, (so far as we keep to the practice which belongs to the science,) that, dismissing from the mind the things concerning which we reason, we shall reason *with* the words, and not immediately concerning the things the knowledge of which is included in the words: briefly, we shall reason *with* words, and not by *means* of words; the latter of which is proposed by *our* logic. The value of this art and science, needs not be here discussed: all we mean at present, is to assert its distinctness from our logic: more about it will be learned as we proceed. It may be sufficient to have stated thus much now, with the hope that what cannot be made quite clear to *our* student in the present stage of his progress, will become so as he advances.

CHAPTER II.

INDUCTIVE LOGIC.

1. Inductive Logic is the art or practice of gathering knowledge by the instrumentality of words. In every act pertaining to this practice, three things occur, the knowledge which the word already includes, the thing known by reason of this previous knowledge, and the increased knowledge which includes some other thing or things. What follows will, it is hoped, make this doctrine understood.

Theory of Inductive Logic.

2. We use a word inductively when, having some certain knowledge which it represents, we advance, by its assistance, to further knowledge, which we *draw under* or *into* the same sign. Let us suppose the word *red* was originally an exclamation uttered on first becoming conscious of that sensation;* and let us suppose that it subsequently loses its exclamative character, and remains a sign of that first knowledge:—when the sensation re-occurs, the knowledge re-occurs, and with it the sign; and by the aid of the sign, we are able to entertain our first knowledge of what *red* is, distinctly from the varying circumstances of its re-occurrence, and to include under it what is common to both occasions of knowledge; to include, for instance, under the same word *red*, the knowledge derived from the red of the crocus, and from the red of a certain earth; and thus we go on, including with our greater experience more and more knowledge under the same sign, till we have extended its meaning as far as convenience or the custom of language allows.

3. Let us take the word *man* as another example: let us suppose it was at first an exclamation uttered on first having knowledge of a creature that was not one's self, yet was like one's self: let us suppose it to lose its exclamative character, and to remain a sign of that first knowledge:—when another occasion of similar knowledge occurs, the former knowledge occurs with it, and the sign enables us to include what is common to both occasions; to include, for instance, under the same word *man*, the knowledge of what a man is, derived from the tall dark man, and the short fair man; and thus we go on till we include under the same sign all attainable knowledge of our species as distinguished from creatures of every other species.

4. Let us take the word *John* as a third example: let us suppose, that this was at first an exclamation uttered when we first knew *John* distinctly from self: let us suppose it to lose

* If we know nothing except by reason of something already known, it is a fair question to ask, how our knowledge can have had a beginning. This question, which needs not stop us here, I have endeavoured to answer in "Beginnings of a New School of Metaphysics;" Second Essay (Sequel) page 73.

its exclamative character, and to remain as a sign of this our first knowledge of John:—when another occasion of knowing John occurs, the former knowledge occurs with it, and we now know him distinctly from each occasion in particular,—from the occasion when he was walking cheerful in the garden, and this new occasion when he is lying sorrowful on the bed. Thus we go on, augmenting our knowledge of John, by familiarity with him under various circumstances of his existence, and including this knowledge in the sign which is his proper name.

5. Let us take the word *proud* or *pride* as a fourth example: let us suppose it to have been an exclamation, when, for the first time, some one person was known to treat another proudly: let it lose its exclamative character, and remain a sign of that first knowledge: the next occasion of similar knowledge may be quite different in persons and circumstances; yet, with the aid of the sign, we are able to hold our knowledge of what it is to be proud, or to have pride, distinctly from the variable circumstances; and by the same aid, we can go on increasing this knowledge, by deriving it from a larger and larger number of instances; and including our enlarged knowledge in the sign which helps us onward to still larger.

6. We shall better understand the previous representation of the manner in which our knowledge is increased, and of the use of signs in fixing and helping it onward, by a few further considerations.

First, we have to consider that all our knowledge is originally derived from the things of sense.* Yet a sensation is

* This, as it is well known, is Locke's doctrine; a doctrine which, carried out on mistaken principles by some of his followers, particularly in France, has issued in what is called *Sensationalism*. The philosophers of this school propose to show that all ideas begin by being sensations, which doctrine another school of philosophers, chiefly Germans, oppose by what is called *Idealism;* or the assertion of certain principles or original ideas existing in or being a part of the mind itself. Extremes of opinion seldom fail to be erroneous; and as seldom does it happen that, before the extremes are reached, there is not, in whatever opposing doctrines, some truth on both sides. With regard to the statement in the text, *if taken in connection with what immediately follows it*, it can scarcely give offence to either of the parties just alluded to:—the Idealists cannot say that we reduce everything to sensation; nor can the Sensationalists aver

not knowledge; nor can it, by itself, create, or be created into knowledge: there must be a knowing faculty, or capacity to know. Now, to know a thing is to be aware of its relation or relations to some other thing or things: to know red, for example, there must be something else known at the same time with it: we must know blue, black, or white, &c., at the same time that we know red. Wherever there is knowledge, there are therefore premises, of which that knowledge is the conclusion; and *red* expresses a conclusion out of such premises. Neither do we know what man is, but by knowing at the same time what is not a man: neither do we know John as an individual, but by being aware of John's existence distinctly from the changeable circumstances of his existence: neither do we know what it is to be proud or have pride, but by knowing what it is not to be proud. In all these instances, (and in all other instances it is the same,) the word which signifies knowledge, signifies a conclusion arising out of premises.

In this process of gathering knowledge, we suppose the previous knowledge and the new phenomena to be so brought before the intellect, that an inference instantly arises. But new phenomena often present themselves under circumstances that ought to occasion doubt; and we then exert or ought to exert some consideration before we admit an inference; which is called a use of our JUDGEMENT. This is a voluntary act, and upon it we lay the blame or praise of the inference. We have, for example, a new substance before us which *seems* to be an earth, and we include it under that name. If it turn out not to be an earth, we say our judgement has deceived us, and what we calculated upon as warranting a conclusion in the deductive process, remains a faulty inference in the inductive. This observation was proper to be made in this place, though it needs not further impede the development of the theory in progress.

7. Secondly, then, (to go on with our theoretical development,) we have to consider that a sign cannot legitimately

---

that we suppose the existence of original ideas, inasmuch as we go no further than the supposition of a power or capacity to receive knowledge; although, as it should seem, contrarily to the Sensationalists, we affirm it to be a power or capacity distinct from the capacity or liability to have sensations.

signify more knowledge than we have attained; and that, of such knowledge, it may signify just so much as our immediate purpose requires. We may, for instance, use the word *red* only as the sign of knowledge derived from the experience of one thing that produces the sensation, and from want of experience; or by choice, we may exclude from the meaning of the word the varieties of red derived from a wider experience, for which, by the custom of speech, the word may be the sign. We may use the word *man*, through ignorance or by choice, only to signify our knowledge of what a man is, distinctly from a boy or a woman. We may use the word *John*, by necessity or choice, to signify no more knowledge of him than the slightest acquaintance gives to any person; and not even so much knowledge as this, but only the knowledge that John exists or has existed as an individual person. We may use the word *proud* or *pride*, only as the sign of knowledge derived from the single action of one single person toward another; and not include under it that wider knowledge which greater experience brings. In all these instances, (and all single words would but multiply the instances,) the sign is legitimately used, provided our knowledge and the sign are coextensive, and we do not confuse our natural understanding by using the sign to supply the place of knowledge.

8. But thirdly we have to consider that all our knowledge is not gained by our own experience: we depend, as a race, in a very great degree on the experience of others, and take our knowledge, in large proportion, on credit. Hence we embrace, as our own knowledge, all the credible parts of past history; all that is reported to us of credible present history; nay, all the facts of experimental science, which others and not ourselves have arrived at, and which we may have never witnessed, but believe to be.

9. And while, with the assistance of a carefully applied logic, we are becoming, by experience, and by fairly received testimony, better and better acquainted with the *real* world, there is an *ideal* world, always enlarging, which we have to keep clearly understood in its relation to the other. Our senses, after having been operated upon by the things fitted to affect them, are not quiescent even when the things are no longer present: the nerves of those senses work internally, though the outward organs are not impressed, and the things

re-appear, but in such a manner that we cannot fail to distinguish them from the realities, unless in a state of sleep when the realities are quite absent, or in certain states of disease which preternaturally affect the nerves of those senses. Supposing, then, a healthy waking state of the faculties, we have to keep our knowledge of the one world clear from any confusion which must arise from mingling the things of the other as a part of it; and this point being secured, we find that as transcripts of the things of the real world, those of the ideal materially assist the understanding in the inductive part of learning.

Note to the previous Section.

The ideal world here spoken of, does not consist of the ideas of Platonic philosophy; these, under our own point of view, we have to speak of in the next section; it is a transcript of the outward world as it has reached the understanding through the senses. But the character of this ideal world must depend on the senses through which it has been received. We commonly mean by it a transcript of the *visual* world. Now this it cannot be to one born blind, or so early deprived of sight as to be equally circumstanced. Yet such a one, (witness Blacklock the blind poet of Scotland,) has an ideal world as complete, apparently, even for poetry, as the ideal world of him who enjoys the full sense of vision. Do we not attribute to Sight, as the inlet of the ideal world spoken of, a greater instrumentality in the reception of our earliest knowledge than it can fairly claim? I have before me what I consider a most able philosophical treatise communicated by the author, of whom I know nothing beyond the favour of his gift sent without date or mention of residence, the title of which is,—"The Principles of Geometrical Demonstration deduced from the original Conceptions of Space and Form: by H. Wedgwood, M.A. late Fellow of Chr. Coll. Camb.;" (Taylor and Walton, 1844;) in following out which deduction, the author shows, that not our *visual*, but our *tactual* impressions, are the early inlet of all the fundamental knowledge placed within the reach of our species.

10. In pursuing the theory of inductive logic, we next find, that beyond the things of sense and the ideal things that reflect them, there are things, the pure abstract stores of the understanding, in following the relations of which, the understanding enjoys a peculiar triumph, as moving in a world entirely its own. These things are properly called *transcendental* or *metaphysical*, because they *transcend* real and ideal things,—because they lie *beyond* the bounds of *nature*.* Every single

* Μετὰ beyond,—φύσις nature. It is doubtful, however, whether the term *Metaphysics* was at first meant to be understood as here explained.

word whatever has its immediate correspondence with such a thing, and only through the medium here indicated has it a correspondence with the things of sense: that is to say, knowledge itself is always metaphysical, though the things we first know, are always things physical. The knowledge, for instance, which we have of *red* is not, itself, either the real or the ideal sensation of red, but something above or beyond it:* the knowledge which we have of *John* is not John himself, and it transcends, or is abstract from, our actual perception of him, and from any idea, that is, image of him which we distinctly form; since in either of these cases, John must be perceived or conceived sitting, standing, lying, or walking, sick or well, older or younger; while the knowledge we have of John, though it includes all these circumstances as they have arisen in our experience, is nevertheless separate from them, since to know John, is to know him distinctly from and beyond those variable circumstances, and from and beyond every other variable circumstance that has arisen in our experience, or may arise:†—the knowledge which we

* Not distinguishing between these is the fundamental error of the Sensationalists. Mr. James Mill, who is one of them, lays it down as a fact that to be in pain and to be conscious of pain, is one and the same thing: it seems so indeed, because, in the recollected experience of every one of *us*, they always come together. But if any one had existed in a single continued state of pain from the moment when sensitive being commenced,—(it may seem strange to say, but philosophical reflection will show it to be true,) he would be in what *we* call pain, yet would not know what it was; which is only another way of saying, he would not be conscious of it. If further words could make plainer, what perhaps is beyond the reach of an understanding that requires more than a few minutes reflection to embrace it,—we might say that one unchanging state of existence such as we have supposed, would not be a state that *happens* to the person,—it would be his very existence, his *very self*. *We* know or are conscious of pain, because we know what is not pain, what is relief from pain, what is pleasure. So we know pleasure because we know pain; we know good because we know evil, and evil because we know good.

† The following passage from Dr. Whately's Logic, is to the same purpose. "When we are speaking of an individual, it is usually an abstract notion that we form; *e. g.* Suppose we are speaking (in 1847) of the present King of the French; he must actually *be* either in Paris or elsewhere; sitting, standing, or in some other posture; and in such and such a dress, &c. We abstract from the separable accidents what we consider essential to the individual, thus forming an abstract notion of the individual." (Book II. Chap. V. § 2.)

have of man transcends, in like manner, the perception or conception of any man in particular; and the knowledge we include under the word *proud* or *pride* is knowledge abstracted or separated from any other knowledge we entertain of the persons who are proud. Now though all knowledge is originally derived from the things of sense, and is of value to us here only in proportion as it is re-applicable to them; yet we have the power, as we advance in knowledge, to dismiss the real and ideal things from which it is derived, and to begin with the knowledge, abstract from the things, as the ground of a higher kind of knowledge; a knowledge which is often distinctly called *Science*. Thus, for instance, without any regard to the *real* or *ideal* points, or straight lines, or circles, that originally suggested our knowledge, we can take the knowledge as the ground of knowledge to spring from it: in which proceeding, the point is not something we can see or feel, or imagine we can see or feel; the straight line is not something straight relatively to something that we can see or feel to be crooked; the circle is not the circle of the sun or of the full moon: but the point, the straight line, the circle, is separate from the times and the things that first made us know what a point is, what a straight line is, what a circle is.

Note to Section 10.

In a foregoing note (the former foot note above) we attempted a stand against the Sensationalists. We may now attempt one against the Idealists, in order, if possible, to keep the medium in which the truth is generally found. The philosophers last named inculcate, after their own manner, the old Platonic doctrine of ideas which exist originally in the mind, and give form and consistency to all the things of sense. This is an extreme, which, inasmuch as it is *un*proved and *un*provable, our slow steps cannot reach. Neither can we see any necessity for supposing these ideas; while we admit, on the other hand, against the Sensationalists, that the things of sense could give us nothing but sensations, if there existed not a distinct power, or distinct powers, through which we have *knowledge* also; that is, through which we are aware how the things producing sensation, stand related to ourselves, and (still with relation to ourselves) stand related to each other. We admit, (with an eminent English Idealist,) that sensations are not TRANSformed into ideas; (See Whewell's Philosophy of the Inductive Sciences, Aphorisms concerning Ideas;) and we admit, (stipulating for our own mode of interpretation,) that they are INformed, namely, that they are received by the understanding in order to take the character of knowledge; our objection to the theory of ideas as a mode of accounting for the fact, being this, that, inasmuch as it is a gratuitous doctrine, it

carries mystery with it, such as, we think, must leave good common sense unsatisfied, while it has a *prestige* for minds that love the marvellous. In short, we admit thus much, and no more,—that the things of sense are adapted to reach man's intellect through his senses, and that his intellect is adapted to receive them; that is, to be aware of the relations in which they stand to each other, but always with a regard to himself, created as he is to understand them in an appointed way: a statement which will appear the more reasonable, by reflecting that among these things he is placed, and among these only, during his present state of existence.

But, say the Idealists, there are ideas that form the things of sense, for which we in vain seek the originals in the outward world. Let us take one of these ideas to serve for the rest, and see how, with our views, we can explain its existence;—let it be the idea (as it is called) of a straight line. Now, we admit that there is no line in nature which we can prove to be straight, nay that there is no line in nature which probably *is* straight, and consequently that no idea, in our sense of the word idea, namely, a mental transcript of the outward thing, reflects to us that which is certainly straight. Whence, then, do we obtain the knowledge of what it is to be straight, independently of these *physical* conditions;—whence, in other words, do we get at the *metaphysical* straight line? We answer, that the fact is sufficiently interpreted when we admit, what surely cannot be denied, that all knowledge is abstract, and consequently free from physical conditions. And our knowledge of the special fact before us thus begins:—we have before us a line which is sensibly crooked, and another which, relatively to the former, is straight. Our original knowledge of the straight, is therefore the *relatively* straight. But this original knowledge becomes an abstraction by merely setting aside all the particular instances which led to it: and then our knowledge is expressed by this definition, that a straight line is a line which is not crooked. In this way, though our knowledge began with the *relatively* straight, we are able to speak of what is straight *absolutely*; but we speak of it in words only: the thing itself is unknown, either as existing, or possible to exist. How, again say the Idealists, could you speak of the *absolutely* straight, unless the previous *idea* (in their sense of *idea*) existed in the mind? We answer, that we are able to do so, by a repetition of the process which has just been indicated. To the human understanding nothing absolute exists in reality, but the *relatively* absolute. But the abstraction of that knowledge exists. In calling this abstraction an *idea*, Kant and the other Idealists dwell upon the fact, and make much out of the fact, that it lies beyond the limits of time and space. This of course we do not deny. We object only to the *mystery* of their explanation. Let it be admitted that a metaphysical straight line exists only in our knowledge of what a straight line is, namely, a line that is not crooked: to such knowledge it matters not whether the thing exists or not. The knowledge, however, is re-applicable to every line which is straight to our senses, that is, *relatively* straight: if it were not so re-applicable, it would be an *empty* abstraction, of no use but to darken understanding with the appearance of knowledge.

PRACTICAL REMARKS BASED ON THE FOREGOING THEORY.

11. The use of words to fix our knowledge, and carry it onward to further knowledge, is the true process of inductive logic; but it too often happens that words are used to hide the want of knowledge not only from others, but even from the thinker himself. The education which is conducted through the medium of books, makes a young person familiar with words, far more rapidly than he can become acquainted with things: nor would there be mischief in this, if he were aware of his real ignorance,—if he regarded the words which he hears, or reads, or repeats by rote, as signs, to a very great extent, not of what he yet knows, but of what he has to learn. The danger is, that he will deceive both himself and others, by mistaking his familiarity with the signs of knowledge, for the knowledge itself. Nor can anything be said to warn him against this error, which has not often been said before,—the common sense of mankind, independently of theory, having prescribed to the young student, from time immemorial, the duty of asking himself what meaning he has with every word he uses, or professes to understand; and the necessity of betaking himself to the ordinary ways of learning, when his knowledge falls short of his language. One powerful method of bringing him to a consciousness of his deficiencies in the inductive process of logic, will be, to require from him proofs of his knowledge in deductive essays or *themes;* the nature and methods of which are to be spoken of hereafter. These essays, it is expected, will be an occasion of frequently sending him back to the inductive process, to supply what has been unconsciously omitted. In the meantime, he may be saved from a great deal of fruitless use of words, by attention to the following considerations:

12. All unrevealed knowledge springs originally from the things of sense; and though in its nature abstract from those things, its truth or reality can be tested only by its re-applicability to those things. By our own experience (meaning of course the experience of our kind) we can know nothing beyond these things; and though it is the height of presumption to believe that nothing beyond our experience remains to be known, yet it is almost equal presumption to pretend that we do or can of ourselves know more. Into such presumption,

however, we are often led, by the empty abstractions which language generates. Language enables us to talk and even think with little knowledge, with less knowledge, and even beyond this, with no knowledge at all. The error, in any of its degrees, arises out of the power of abstracting knowledge from realities; and, in its extreme, it will always be found to consist in using a sign where nothing at all is signified, except our inability to carry our knowledge further. We must go back to our previous theory in order to make this general caution properly understood.

13. In the metaphysics of quantity, we are saved from wandering among proofless abstractions, by the constant applicability of those abstractions to the things of sense; and during the progress of our learning, we are, at every step, reminded of the connection between the two,—for instance, between the metaphysical point, or line, or circle, and every *real* point, line, or circle,—by the sensible or ideal representation we carry with us.

14. So likewise in making *red*, or *John*, or *man*, the subject of our thoughts,—although each word corresponds immediately with an abstraction, yet we are saved from inutility of thought, by the constant re-occurrence to our senses of the individual things from which our knowledge is derived, and to which the word is immediately re-applicable, so as to prevent the danger of supposing we know what we are partially or wholly ignorant of.

15. Such, however, is the mechanism of language, that a word may not only signify the abstract knowledge of a real thing, or real things, (and this is what every word must signify if it signifies anything, because knowledge is by its nature abstract from the thing known,) but the word, before it descends to the real thing or things, may be the name of an abstraction, which abstraction, if it means anything, means the knowledge of the real things which suggested it. Let the following be our example of the manner in which this double abstraction takes place. Suppose the word *Proud* to have been originally a proper name applied to an individual from his known character:—no delusion of thought is likely to arise while the word is so applied and understood:—Suppose, in the second place, that the word is used adjectively before the proper name of another person, as *proud John;* in which

application the word indicates that *John* and the former person are understood to agree in character: again, no delusion of thought is likely to arise; for though we may, for a moment, have understood, under the word *proud*, something separate from *John*, yet the grammatical form of the word will have prevented our resting in that separate meaning beyond the first moment: on the junction of the two words, we understand them as one name for one thing, and are in no danger of confounding the metaphysical separation and distinctness, with a real distinctness,—of supposing, for an instant, because *proud* and *John* are two words, that *John* is resolvable into two correspondent things. But when, without any change in the logical import, we change the grammatical function of the word,—when instead of *proud* we say *pride*, we take the word away from that which would realize its meaning. and render it not merely the sign of abstract knowledge, but the *name of an abstraction*, and we have, in consequence, to descend a step lower before we get to the realities which that abstraction includes, or ought to include, as the things known by it. Now, the danger is, that the thinker or reasoner may never have begun with, or may never go back to take, this lower step; that he may discourse to himself or others concerning pride,—"passion, or apathy, or glory, or shame,"—without knowing by experience precisely what he means; in which case, his discourse must be "vain wisdom all, and false philosophy." *

16. It is further to be remembered, by way of caution, that the forms of language into which abstract names are joined, contribute in no small degree to a delusive use of words in the acquirement of knowledge. We speak, for instance, of *the pride of John*, or *John's pride;* of *pride belonging to John*, or *John possessing pride*, in phrases of the same form as when

---

* Others apart (other devils) sat on a hill retired,
In thoughts more elevate, and reasoned high
Of Providence, Foreknowledge, Will, and Fate,
Fixed-fate, Free-will, Foreknowledge-absolute,
And found no end, in wandering mazes lost:
Of Good and Evil much they argued then,
Of Happiness and final Misery,
Passion, and Apathy, and Glory, and Shame;
Vain wisdom all, and false philosophy!
Par. Lost, B. II.

we say *the brother of John*, or *John's brother*; of *houses belonging to John*, or *John possessing houses*. It cannot but be evident that such similarity of phrase must have the effect of misleading a thinker, who trusts to the forms of language, and is not in the habit of considering the things to which those forms are applied. In the instances before us, we have to remember, that there is no such real thing as pride distinct from John, and persons like John in character; but that there are such real things as the brother of John, and the houses belonging to John, distinct from John himself: that is to say, pride is a thing metaphysical or abstract, but John's brother, and John's houses, are realities.

17. Suppose, in the next place, that there is nothing within the reach of our human powers to which a word or phrase is applicable, the proper interpretation of such word or phrase when attempted to be so applied, is, that it stands as the sign of our *ignorance*. When we say infinite or endless space, infinite or endless time, all we know or can know of those things, is, space endless *relatively* to ourselves, time endless *relatively* to ourselves: what time or space may be beyond our experience of what it has been, and what it continues to be, we know not: we can take the known portions of time or of space, and think of such portions as still going on; but this is time or space *unended*, and not *endless*, unless, as before said, we understand *endless* to mean *relatively* to ourselves; that is, only so far as our race can have experience. The same reasoning belongs to such words as absolute, perfect, complete: we know nothing, and can know nothing but the *relatively* absolute, the *relatively* perfect, the *relatively* complete. We are justified, nevertheless, in applying these words to the Divine Being; but let it be remembered that when so employed they do not bring the nature of that Being within the reach of our faculties: they say, if they say anything, that however well we may understand what it is to be absolute and perfect when things of sense are in question, we apply the words in reverence only, without pretence to knowledge, when we apply them to God:* we use them as signs that represent what in merely human science, is unknown and unknowable; and so

* See Whately's Logic (*Ambiguity of "same"—Logomachy*, &c. Book IV. c. v. § 1) in confirmation of this point of view.

used, they are serviceable elements in the structure of human language. This indeed is the only way in which empty abstractions, that is, abstractions which throw realities quite out of question, can be legitimately used: and our system of inductive logic having reached this point, makes no pretence to go beyond it.

Note to Section 17.

And just where we leave off, METAPHYSICS, in their usual form and purpose, begin; especially the Metaphysics of Germany. The strength of the systems which arise in that country of interminable speculation, consists in their being *unprovable:* for how shall we set about disproving that, which, as it lies beyond the reach of proof, is equally beyond the reach of contradiction. The German philosophers employ the abstractions, all of which are obtained originally from the things of sense, to interpret things which lie completely beyond our present state of existence. So employed and so applied, they are hypotheses; and if it were possible to establish them by inductive proofs, we might accept them on credit till the proofs were added. But the proofs are impossible, and the demand is preposterous that we shall accept mere supposition for science. Call these systems romances, and we may dip into them, perhaps, without danger. That they are nothing more, is evidenced by the fact, that one of them is no sooner promulgated, than it gives occasion to another to dispute its pretension, Kant is succeeded by Fichté, Fichté by Schelling, Schelling by Hegel: a kaleidoscope has not more shapes for the eye, than metaphysics for the German mind. The mischief is, that these systems pretend to be more than romances: they pretend to carry the human intellect into the impenetrable unknown which everywhere surrounds us. A lively faith can irradiate this unknown with a light from itself, and take away all its gloom, without pretending to see into it with the eyes of human reason: but these metaphysical romancers come with false lights, offering what they call *science* in place of *faith.* "To-morrow," Fichté is reported to have said, in the adjournment of the next point of his lecture, "to-morrow we shall create God." Had his pretence been only to offer a romance, the announcement, though profane, would have been harmless; for who, as he proceeded, would have been ready to say, "I believe in Fichté, the maker of God?"

RECAPITULATION OF DISTINCTIONS AND DIFFERENCES.

18. All knowledge is abstract, that is, separate, and of a different nature, from the things that originally suggest it. These things are real things, the things of sense; and the way in which we unavoidably understand them, is, that they exist distinctly from oneself. But beside *real* things, there are things *ideal*, and things *metaphysical*, which become the subjects of knowledge.

19. Ideal things are those which we imagine to exist dis-

tinctly from oneself, by a voluntary delusion which our better knowledge can at any time set aside ; as a fairy, a gorgon, Lilliput. Of ideal things, some are altogether fanciful ; but others are more or less accurate representations of real things that are, or have been ; as, London, Adam, Leviathan, Babylon.

20. A thing metaphysical is a state of one's thinking self, which state we can make the subject of higher knowledge. It is different both from real and ideal things, though liable to be confounded with them. Thus the metaphysical straight line or circle, the moment it is realized, or imagined, ceases to be metaphysical. Thus, though we can personify *Virtue* or *Pride*, we cannot in any other way think of pride or of virtue as having real existence. But we can know what *virtue* is, and what *pride* is : that is, we can know a certain state of one's thinking self as having been a state of previous knowledge, —the knowledge that such and such men acted in a certain manner, so as to be approved in the one case,—to offend in a certain way in the other. If indeed we have no such previous knowledge, and yet talk of *virtue* or of *pride*, the words are empty names that only serve to conceal ignorance.

21. All words that are parts of speech are signs of things metaphysical. But some of them can be immediately applied as names of things real, or ideal ; while others can be applied only as names of things metaphysical. Thus the name *John*, the name of a familiar friend, although it signifies our knowledge of him abstractly from all the circumstances under which we have known him, can be re-applied to him in connection with any circumstances under which we may know him again. Thus the name *man*, the name of any one of our species, although it signifies our knowledge of what our species is, abstractly from any one of our species, can be re-applied to any one of that species. But the name *virtue* or *pride* cannot be applied to any thing real, or to any thing ideal, except by poetical personification : it can be applied only as the name of previous knowledge, and if we have not the previous knowledge, it is an empty name.

Hence, then, there are names of things *real*, of things *ideal*, and of things *abstract* or metaphysical.

22. In Grammar, it was found useful to borrow from Logic the distinction of names into Names proper, common, and abstract. A proper name is a name immediately applicable

to some one particular real or ideal person or thing; as, *John*, *London*, *Jupiter*, *Lilliput*. A common name is a name that can be immediately applied to a person or thing, with reference, at the same time, to the class or kind of things to which the person or thing belongs, whether real or ideal; as *man*, *fairy*. A name abstract is a name not applicable to a real or ideal person or thing, (except by personification,) but only to a state of knowledge, under which we apprehend something concerning real or ideal persons or things; as *virtue*, *pride*. But a name abstract may become a name common if we make it a name for several states of knowledge, Thus, the name *virtue* may be a common name for the special virtues, *Prudence*, *Justice*, *Temperance*, *Fortitude*; or *Faith*, *Hope*, *Charity*.

23. Language is the instrument of reason by which we collect knowledge, so that it shall be ready for re-application to the things known. In order to serve its purpose, language is very flexible; and the logician, in availing himself of the changeable import of a word, has to notice, 1. Its Etymological sense: 2. Its General sense: 3. And its Particular or Applied senses.

24. The etymological sense of a word is its original sense, so far as we are able to trace it. Thus the original sense of *To prevent* is to go before; the original sense of a *villain*, is one who lives in a vill or small town; the original meaning of a *regiment*, is rule or command, or something ruled, or commanded; the original meaning of the word *thing*, is that concerning which we *think*.

25. The general sense of a word is that which includes under it all more particular or special senses. Sometimes this coincides with the etymological sense; as *regiment* when it means every thing that is ruled or commanded, which sense will include the special object, a body of soldiers commanded by a colonel. The general sense of the word *man*, is that which includes every human being, male and female, in every stage of life. The general meaning of *animal*, is that which includes every organized being that is liable to sensations of pleasure and pain; the general meaning of the word *plant*, is that which includes every organized being that is destitute of sensation. The general meaning of the word *sensation* is that which includes every effect, pleasurable, indifferent, or painful, which reaches the brain of an animal by the operation of an

external cause.* The general meaning of the word *thing* is that which includes every possible subject of our thoughts, real, ideal, and metaphysical; and this general sense coincides with the etymological sense.

26. The special sense† of a word, is some limited application deduced or deducible from its general sense. Thus the name *man* may be specially applied to any human being not a female, nor a boy or infant. Thus the word *animal* is sometimes applied to a brute animal only. Thus the word *regiment* while it had a general meaning, was often specially applied to a body of soldiers commanded by a colonel: which special meaning has now become the common meaning, and the general meaning is now almost forgotten.

27. In the use of signs to advance and fix knowledge, it appears that there may occur abstraction, generalization, and specialization.

28. Abstraction is the separation of knowledge from the thing known. It is the beginning of knowledge, there being no such thing as knowledge till abstraction takes place. And abstraction is carried on by the use of language. The word *John*, may have first meant, *John, an infant, lying in his nurse's lap.* But when we know *John* under other circumstances, our knowledge of him is abstract, that is separate from those circumstances: and not only is *John* the sign of abstraction from the particular circumstances, but every other word which helps to form the description of *John*, is also the sign of abstraction from particular circumstances.

29. Generalization is the process of abstraction by means of a name made common to two individuals, and applied successively to more individuals, till we have included under it all we find useful to include. Thus the word *man* may have first meant a single individual, and then it was a proper name. It may then have been applied indifferently to two individuals by excluding what was peculiar to each. And so it continued to be applied to three, four, five, &c.; till it became a name for any individual of the human kind.

30. Specialization‡ is the opposite of generalization, and

* That is, external as regards the brain.

† In Aristotelian logic, any special sense of a word is called *a second intention.*

‡ J. Stuart Mill is the originator of this useful philosophical term.

properly belongs to deductive logic, because the ordinary way to make a word special, is to join to it words that have that effect. Thus the word *man* is, made partially special, when we say, "a short old *man* in a brown coat."* But a single word is sometimes made to take a special meaning deduced from a meaning more general; as the word *doctor*, whose general and etymological meaning, is, a learned man; but which sometimes means, specially, a man to whom the diploma of a degree bearing that name has been given by a university; and sometimes, in common or vulgar use, one who undertakes to cure diseases, whether he has received a university diploma or not. A general word thus made special, is an instrument of inductive logic, as well as all other single words.

Suggestions for avoiding, during the Inductive Process, the delusions of the Rhetorical Sophist.

31. Sophistry is an unfair use of art in Rhetoric, in order, for some partial end, "to make the worse appear the better cause." The delusion, indeed, is not always designed, the rhetorician as frequently cheating himself before he sets about misleading others. But this makes no difference as to the likely prejudicial effect; and our learner has to be warned against this effect, while pursuing (what every one pursues, right or wrong, during his life,)—the logical process by which knowledge is stored up for subsequent development.

32. One common means of delusion, and the first we may mention, because it will be the first against which the logician will be warned in his own deductive use of language, is *the use of high-sounding verbiage*. He has already been cautioned on this point, particularly in Sections 11 and 12 preceding; but the caution cannot be too often repeated. It is again urged in this place, because, when a point cannot be otherwise carried, the rhetorician often addresses the ignorance of his hearers, offering them sound for sense,—the empty parade of learned terms for the substance of learning. Even the substance becomes a snare when used to bewilder the understanding of the hearer or reader, and keep him from

* For the single word is not special in meaning; but it merges its single meaning in the logical noun it helps to construct; and the meaning of this logical noun is special.

inquiring after truth in the true direction. Thus the quack makes a parade of medical knowledge, in order that you may take his pill, which has been prepared, he is well aware, quite independently of such knowledge; and thus a rogue, as the novelist shows, displays a single piece of learning, got by rote, whenever he meets with one who is likely to be a new dupe, through the reverence in which we are disposed to hold a learned man.

32. Akin to the means of delusion just mentioned, is *the parade of logical forms*. This indeed is not so practicable a snare since the formal logic of Aristotle has been less in repute; but that it is still used with effect on some occasions will appear from a few examples in the 10th Section of Chapter V. In the mean time, we have to assure *our* scholar, that the *form* in which a piece of reasoning may be couched, is never a security that the reasoning is just, nor a defect in the form an evidence that the reasoning is false. To say that, "All projectors are unfit to be trusted; this man is a projector; therefore he is unfit to be trusted,"—will never convince a sensible thinker, while he admits all habitual projectors to be untrustworthy, that a prudent man who now and then comes forward with a feasible project, is a man unfit to be trusted. And to say, "All wise legislators suit their laws to the genius of their country; Solon did this; therefore he was a wise legislator,"—will not prevent him who reasons by *means* of words, and not *with* words, from *receiving* the reasoning as quite correct, although the Aristotelian *form* of reasoning fails.* Neither when the argument for the existence of a God from its being universally believed, is met by the instance of a nation destitute of such belief, will *our* scholar be more, we think he will be much less, in danger than the Aristotelian of allowing the objector to go further than his objection warrants, by asserting, namely, that because the existence of a God is not universally believed, all argument for the existence of a God is set aside. In any case like this, which demands nothing more than efforts of the natural understanding operating by *means* of words, but not using them in place of thought, to talk to *our* scholar of being on his guard against

* Both examples will be taken up again in Chapter V., (Sections 9 and 10,) and the true character of their faultiness explained.

an illicit process of the major term,* would be to prepare him for being operated upon, when *off* his guard, by such means of delusion as it is the object of this section to characterize.

33.† The next means of rhetorical delusion which may be mentioned, is a means very much in use at the present day, that of appending to *an abstract or general proposition*, every special practical inference which it may suit the views of the reasoner to draw from it. Thus, it having been said, and, in general terms, safely said, that wholesome food is food fit for our species; and a certain article of food having been found wholesome by such and such a people, we are required to act on the general admission, and force its use on a different people. Now the proof that it is wholesome does not reach further than the experimented instances, and our general admission cannot fairly be extended to such an issue. With regard to people who live in another climate, or under any other different circumstances, the proof is yet to come, and till it come, the issue proposed is a practical *non-sequitur;*

---

* See Whately's Logic, Book III. § 7.

† A great part of what follows in the remaining four sections under the present head, though not literally quoted from, is suggested by the excellent matter contained in Dr. Whately's Chapter or Book on Fallacies (referred to in the previous note). That the author of this Manual has not been able to draw greater benefit from the chapter in question, is caused, as he thinks, by the mischievous interference in it of Aristotelian principles. If Dr. Whately had not predetermined to be more consistent than his fellow Aristotelians, if, like them, he had given up the doctrine of the formal syllogism when he came to treat on fallacies, and spoken of them in the language of common sense, the Chapter, which is now excellent only in parts, would have been excellent as a whole. But Dr. Whately, (unfortunately as the author thinks,) does his utmost to reconcile this part of his logic with what precedes, chiding his brethren for having here renounced their science. "Whenever," he says, "they have to treat of anything that is beyond the mere elements of logic, they totally lay aside all reference to the principles they have been occupied in establishing and explaining, and have recourse to a loose, vague, and popular kind of language." (Introd. Book III.) The effect of Dr. Whately's greater consistency appears to be this,—that in endeavouring to draw a line between logical and non-logical fallacies,—between what can be explained on the principles of Aristotle, and what must be explained according to common sense, he very much mystifies the latter mode of explanation, while he is obliged to draw his intended line in so zig-zag a way, that, for whatever purpose, one cannot help thinking it had better not have been drawn at all.

a case of having *proved too little.** Again; we may allow that every one has a natural claim to be free; but the admission of this in the abstract, does not bind us to join in every special act which it may be cited to justify. Employed in this way, it is an argument that *proves too much;** for with lax unconditional interpretation, it necessitates the freedom of madmen, and of infants or idiots. Again; we may very safely admit that a Representative is one who represents others; but from this general admission, it can never be inferred in what particular manner he is bound to represent them; it may be as their messenger, it may be as their spokesman, it may be as their delegate with special restricted powers, it may be as the member of a legislative assembly. What are his duties in any case or capacity whatever, will evidently be undeterminable by the general signification of the word: to ascertain these duties, we must ask in what way, by prescription, or law, or usage, or power specially held and specially granted, he is required to act.—These three examples may stand for many others that might be given, involving such abstract terms as Socialism, Communism, Equality, Fraternity. We may admit the justness of general definitions drawn from these and similar words; but we are not bound to join in following out the definition into practical consequences when we have no test from experience or custom to warrant our proceedings.

34. Another means of rhetorical delusion, is that of shifting from one sense of a word or a proposition to another, so as to lead the logician, in his inductive progress, to admit the conclusion of the one sense, as the conclusion of the other. This delusion often takes place in thought, without any exterior cause, other than the equivocal character of the word. "Thus," says Dr. Whately, "a young divine perceives the truth of the maxim, that for the lower orders one's language cannot be too *plain*, that is, clear and perspicuous, so as to require no learning nor ingenuity to understand it:—when he proceeds to practice, the word *plain* indistinctly flits before him, as it were, and checks him in the use of ornaments of style, such as metaphor, epithet, antithesis, &c.; which are opposed to *plainness* in a totally different sense of the word."—

* See Chapter V. Sections 11, 12.

Hence, in many instances, "a dry and bald style, which has no advantage in point of perspicuity, and is least of all suited to the taste of the vulgar." (Book III. § 5.)—The next example is also from Dr. Whately, though with different arrangement. In saying, "He who necessarily goes or stays," we may mean—*he who goes of necessity, or stays of necessity*: Or we may mean this alternative, that *he must either go or stay as his will may determine.* Now the person under the former description is evidently not a free agent; but the person under the latter has all the freedom which we can attribute to a free agent. The sophist may, however, so conceal his transition from one of these two meanings to the other, as to get an admission of the doctrine of universal absolute necessity, the doctrine which insists that no man is, in any case, a free agent.

35. A further means of rhetorical delusion is that of making a conclusion which is true of an aggregate, appear to be true of the particulars of the aggregate; or the reverse of this. We need not notice the former mode at present, because it can hardly be practised successfully on one who is not trammelled by the forms of the Aristotelian syllogism, a caution against the false forms of which has already been given above (Section 32); and also because an occasion will occur for exhibiting some examples in Chapter V. (Section 10.) But the reverse of this mode of delusion may be here noticed, namely, that of making a conclusion which is true of the particulars of an aggregate, appear to be true of the aggregate. Now there can hardly be a delusion in so plain a case as the following:—we conclude, or more properly infer, when, in throwing dice, a person casts two sixes now and then, that he does so by what we call chance or good fortune; but if he casts two sixes fifty or a hundred times running, we can hardly be driven or seduced into the same inference, reason guided by experience teaching us, in such case, some very different inference. Yet in cases not dissimilar, a hearer or reader may, by a juggle, be led away from this natural procedure of the understanding. Let our example take the form of a dialogue; only, be it observed, the events supposed in it are prospective, not determined. "Tom, I would advise you to resign your place immediately." "What, in order that you may be promoted to it?" "No, not for that reason, though

I am the next to succeed you; but because of some news I have just learned, that you will be placed in a much better situation, if when it is vacant, you are in a condition to have it offered to you." "How so?" "Why A. B. is so ill that his doctors say he cannot live a month." "And what then?" "Why his office being vacant, will be eligible for you, if, which you know is an established proviso, you are not in place at the time." "But there are others for whom it will also be eligible." "Yes, but they are only a few; and, doubtless, your uncle will, by that time, be returned from America, who has interest sufficient to make your superior qualifications properly understood. With all these *concurrent* probabilities in your favour, I do say you must get this place, if you resign that which would decidedly prevent you from it." Now, if without regard to further considerations, such as the possibly very low value of the one place and very high value of the other, Tom should, on this representation, give up his place, he would be guilty of a practical non-sequitur—of being deluded in a case of *having proved too little*. The sophist speaks of *concurrent* probabilities, as if, in the *aggregate*, they made up a *greater* probability, when the fact is, that the number of the probabilities diminishes the value of each as regards the issue of the aggregate, so that the value of the whole must be calculated inversely to their number.

36. Perhaps the remaining means of rhetorical delusion, may be summed up by saying that they are all carried on with the purpose of keeping out of sight, as much as possible, the particular point or points to which attention is required, for the purpose of reaching the truth that stands opposed to the immediate interests of the sophist. If any accredited book of rhetoric had systematized the particular means of carrying out such a purpose, it would be the business of logic to oppose, for the benefit of its inductive learner, a correspondent arrangement of means to avoid the several snares. But whatever may be the corruption of our nature in *practice*, we are not so lost as to tolerate such a system in *theory*, any more than we tolerate a written art of poisoning or of seduction. As, therefore, there is no system to oppose, there will be very little system in the observations which follow. It cannot be doubted, however, that unscrupulous persons who have partial ends to carry, do find too easily, without express instruc-

tion, the means to their purpose: and it is for us to meet these artifices, if not by instruction directed against each means in detail, yet by general remarks which may indicate their common character, and how they are designed to operate. Now, the ordinary plan of calling off attention from an important *questionable* point, is, to refer to it as a point *not* questioned among the select well-informed class of persons who are presumed to be the leaders of opinion. By this plan, a modest hearer or reader, not included, by his own modesty, in the class, may doubt the extent of his information, so as to suppose that he has not reached the knowledge which persons of that select class enjoy. The plan here spoken of, may be carried out variously. First, for example, the questionable point may be delayed till the end of a long preliminary discourse, a discourse not at all touching the particular point, but dwelling on unquestionable generalities, advanced, all along, on the understanding that they involve the particular point yet to come; which point, when it comes, is stated as a thing of course, that all persons of competent information have already admitted. Or, secondly, the questionable point may be mingled with another, about which there is no question; and the two may be so shifted that at last they seem one, and a conclusion may be insisted on which carries the questionable point, though it truly carries only the other. Or, thirdly, the questionable point may be so put to the hearer or reader in the very form of a question, that if he is seduced to answer it according to the form in which it is proposed, and not according to the form in which the truth requires it to be proposed, namely as being true or false, he must give an answer suitable to the views of the sophist. Or, fourthly, a series of cases may be proposed, as being all the cases to which, respectively, an answer can be given; when there remains another case appertaining to the point at issue, by omitting which, the sophist secures a triumphant answer in favour of what it is his interest to prove. Moreover, any of these methods may receive considerable assistance from the tone or style of the rhetorical reasoner; a tone or style indicating his connection with a high grade of thinkers, and a disparagement of those who, by their way of thinking, prove themselves not to belong to the same high class.—Some examples of these several observations (they

must be hypothetical) may be necessary. Suppose the sophist desires to establish, in the minds of his hearers or readers, the questionable fact that a certain minister of state is corrupt: using the means first indicated, he holds a long preliminary discourse on the baseness of those who, being in places of high political trust, abuse their power to serve their private ends; and exciting in this manner a strong virtuous indignation, without pointing to any person in particular as the object of it, he asks, at last, *not* whether A. B. is a man that deserves this indignation, but assumes that he *is known* to deserve it, except by people who are shut out, by their station, from being acquainted with what is done in high places (not saying so in words, but implying as much by his tone or style); and thus, if his hearers or readers are not on their guard against the delusion, he gains his point, by keeping them from the only inquiry which truth obliges them to institute. Suppose another instance for our first case :—it suits the sophist to fix it as a fact in his hearers' or readers' minds, that a certain root is not a cheap article of food. To all people of common sense, this would appear an affair of mere calculation. Accordingly, the sophist begins with calculations, elaborate and accurate, of the produce per acre of this article of food and of the other, sliding in, somewhere, as a point known and admitted in science, that the root in question contains but a tenth part of the nutritive matter which exists in the substances opposed to it. Now it is evident that all the previous calculations will most likely amount to nothing, unless the last point is clearly established, but instead of establishing it, the reasoner, by such an artifice as this, may contrive to make it pass for granted, and thus his object is gained.—Suppose further, in order to elucidate the second means of sophistry indicated above, that the rhetorician wishes his hearers or readers to admit the necessity of transporting criminals to a foreign colony ;—he might mingle this questionable point with one concerning which there is no question, namely that it is necessary to repress crime in the parent country; when, by passing frequently, in a long discourse, from one to the other of these two questions, he might succeed in making them seem one; that is, in making it appear that the *only* way of repressing crime in the parent country, is the transportation of its felons to the infant settle-

ment.—Suppose once more, in order to elucidate the third means of sophistry which the previous remarks hint at, that the sophist wishes to establish it as a fact, that A. B. evaded, by a trick, the full payment of his just debts;—instead of setting his hearers or readers to inquire whether such *was* the fact, he may ask whether any one of them recollects the *date* of the fact. Or, in order to elucidate the fourth means of sophistry spoken of above, suppose the fact to be known that A. B. did compromise with his creditors, but the question to remain, whether it was through dishonesty, or imprudence, or unavoidable misfortune,—the sophist may stop his hearers or readers from inquiring into the probability of the last cause, by asking whether it was through dishonesty or imprudence, shutting out, by this only alternative, the thought of any other:—And, lastly, as to the power of a certain tone or style of speaking in eluding a questionable point, we may suppose, for our example, a sincere holder of some religious tenet, to be thrown among unbelievers. A sophist from among these, instead of asking the grounds of the belief which he wishes to undermine, and opposing them by direct argument, may, by speaking of them with banter and contempt as not worth an argument, gain the end which he could not have reached by a direct road.

CHAPTER III.

DEFINITION.

1. Definition is the act of so fixing the limits of a term, that nothing more nor less than it is intended to signify at the time, shall be included in it. It is an art growing out of the use of language, and possible only by having words to operate with, or signs equivalent to words. Its general purpose is, to assist the natural understanding; and this it accomplishes by subjecting all the knowledge acquired by it to one single relation, not permanently to take place of those unnumbered relations under which the things we live among are apprehended, (for this would be not to assist our knowledge—it would be to supplant it,) but that, in the inductive and deductive process, we may stop at convenient stages, and fix, and connect, and arrange, by the one pervading relation, the

whole of what we know, whether for the purpose of going on to increase our stock, or of developing the stock acquired. The art we speak of, is an essential part of formal logic, and a most important part of ours. The formal syllogism,—that which works by extremes and middle term,—would, without it, have been an impossible construction; and with regard to our logic, though it can, in a certain degree or condition, exist without it, and does so exist in the practice of uneducated people, yet, in such condition, it has no claim to rank higher than the many ordinary arts which we learn and practise without express instruction. We therefore willingly accept, from formal logic, this part of its doctrine,—the only part of it which is truly useful.

Theory of Logical Definition.

2. We have seen in the previous chapter, (sect. 25,) that the power of a name to extend its comprehensiveness, has no limits but the want of further things to receive its meaning; and hence we have names, as *thing*, *being*, which include every possible subject of thought.* And if we have names thus comprehensive, the same process which led up to these, will have produced others of less and less degrees of comprehensiveness, till the names are those on which the process has not yet been tried, that is to say, proper names, or the names of individuals. As the process consists in superinducing a relation upon the results of the natural understanding, and therefore is an artificial process, so, though the principle is always the same, there are great differences of detail in applying it. For instance, almost every transcendentalist has his own set of categories, the *summa genera* under which he is led, by the character of his inductive studies, to marshal the developments of his understanding. What these severally are, needs not be stated here: it is sufficient to say that not one of them exactly coincides with the views unfolded in this Manual, which therefore proposes its own categories, namely

* Except *nothing* or *not-being;* a name which, shadowy as it is, still keeps the fact present, that wherever there is knowledge, there must be, under it, the thing known, and the thing by which it is known. Here, the former is denoted by *thing* or *being;* the latter, by *nothing*, *not-being*, or *nonentity;* or, contrarily, we know what *not-being* is, because we know what *being* is.

the distribution of all things which can be the subject of thought into *Things-physical*, and *Things-metaphysical*, the former of these subdividing into *Things-real* and *Things-ideal*. Now, as to things-ideal, since they are the counterparts or the compositions of things-real, we need not pursue them distinctly from things-real, but go on to speak of the subdivisions as equally belonging to both under their general denomination of Things-physical. There is an old division of real things into *matter* and *mind;* a division which, in our days, has been thought sufficient to warrant an inductive system of philosophy built upon the latter, so as to be distinct from the sciences professing to be concerned solely about the former. Whether this is, or is not a sound purpose, requires no discussion here: it is sufficient to assert that though the distinction on which it is founded is a most convenient one for many logical ends, it is one concerning which we can at present *know* nothing (whatever we may believe) further than that man is a being capable of constant progress in knowledge, and raised in this respect above all other creatures perceptible by his senses. We may state this fact by saying he has a *mind;* but in so stating, we do not explain, or get beyond the fact as previously stated.* Transferring, then, both *matter* and *mind*, from the place sometimes assumed for them among things-physical, to

* Be it well observed that what is here said, interferes in no degree with the Bible doctrine of man's immortality, but goes quite along with it, as far as, on human grounds, any doctrine can go. Nay, even the Platonic doctrine of the immortality of the soul, (a doctrine not identical with the Bible doctrine, though not contrary to it, and therefore, by believers, often, perhaps almost always, joined to it,) even that doctrine is not *contradicted* by what is said above, though its claim to *scientific* validity is questioned. Nor, again, do the remarks made above give any countenance to what is called *Materialism;* for if it asserts that *mind* is an abstraction, that is, not a Thing-physical but metaphysical, it asserts the same of *matter*, whose existence as a substratum or common essence of all the things of sense, is, like the other point, quite unsusceptible both of proof and disproof. Matter, as far as we can know anything about it, has its existence only in an arbitrary definition, which comprehends just so many of the things of sense as experience in physical science points out to be expedient. In the meantime what more rational to believe than that man, however assimilated to the things of sense among which he is now placed, is designed for immortality, by having means within reach for regaining the perfection of a nature that evidently struggles to raise itself above them?

what we deem their proper place, namely among things-metaphysical, we come next,—in our progress down toward individual things,—to the domains of acknowledged inductive science; and what shall here be the *summa genera* or heads of classification, depends on the judgement of those who, having experience in those wide domains, are qualified by such experience to guide others. All that logic proposes, is, to direct the *principle* of every classification, not to lay down the classification itself. That principle is easily stated. The *summum genus* or general name of the things about which the science, whatever it may be, is conversant, must be divided into subordinate heads, each of these again into sub-subordinate heads, and so on downwards till our last division brings us to the individual things by which our earliest knowledge was suggested, and for the better comprehension of which, this systematizing principle has been put in operation. The word division, be it here observed, is not, in describing the foregoing operation, used in the same sense as when used in speaking of the division of any natural substance into parts,—as for instance into halves, quarters, or eighths, and so forth,—but it is used to signify what, for common apprehension, we might better signify by the term *distribution;* distribution implying that the whole is spread out, remaining, as a whole, what it was. Our meaning above, then, otherwise stated, is, that the chief head is spread out into subordinate heads, each of these, again, into sub-subordinate heads, and so on till the lowest heads can but be spread out into the individuals of which they consist. Now it matters not what the chief head, or the subordinate heads, or the sub-subordinate heads are called;* we have only to remember that, in logic, the names employed are commonly these: *summum genus* for the chief head; *genus* for each of the heads under it; *subaltern genus* for each of the sub-subordinate heads; and for each of as many more as may be subjected to each of these; till we come to the *proximum genus*, or that next above the *species*, and then under each species we have only individuals.—Be it observed, however, that every subaltern genus is a species with relation to the genus immediately above it,

* As, for instance, instead of the names which follow above, we may use those of *Class*, *Order*, *Genus*, *Species*, *Variety*.

and therefore every such genus is a proximum genus with relation to such species.—So much for the application of the principle to physical things.—Returning now to things-metaphysical, we have this important observation to make; that as they have their existence only in the understanding, so the enunciation of them in the form of definition, must always, if the enunciation is adequate, be equivalent to the things themselves; as, for instance, the definitions of a point, a line, a circle, &c., in mathematics; the definitions of virtue, vice, pride, "passion, and apathy, and glory, and shame;" and so on with the terms of double abstraction * in whatever other science.

3. Such are the effects, described generally, of superinducing the indicated one relation upon all the knowledge which the natural understanding collects. It is this that renders logical definition possible. Uneducated persons do not define,—they describe; that is to say, when they try to convey their knowledge to others, they refer only to individual things, distinguishing these from each other by every variety of mark through which they differ to the natural understanding. And this indeed is knowledge,—the knowledge enjoyed by our species at large:—and logic in its superinduction of one universal relation to connect and arrange this knowledge, is a most useful minister to knowledge. But when, beyond this, it builds an art of reasoning upon its own arbitrary arrangement, in order to take the place of, or even to explain the natural acts of the understanding, it then becomes, so far as it can attain its purpose, a mischievous innovator instead of a useful minister. We say, *so far as it can attain its purpose;* which purpose fully attained would be, to put words artificially explained in place of thought derived from things,—to reason *with* words instead of *by means of* words. But in fact the Aristotelians never have reached this point in perfecting their art,—fortunately in one respect, but unfortunately in another; since, if it could have been carried fully out, its monstrous pretensions would have been earlier discovered. But the bulk of mankind never have been drawn into the use of their artificial syllogism; and even themselves,—nay, even in illustrating that syllogism,—have in general used informal

* See the previous chapter, sect. 15.

shapes, as suggesting meaning more readily than the strict forms of their own syllogism. Yet with these hindrances to its presumed mischievous effect, the predominance of Aristotelian logic in the schools of Europe during several ages, was accompanied by a sign sufficiently indicative of mischief somewhere, namely by activity in learning without progress and without fruit. Inquiry, during that time, moved only in a circle; and he who left his place of education at twenty years of age, was sure to find, if he visited it at sixty, the same questions going on, which employed him in his youth. When philosophy spread her wing to reach the height she is still seeking, the trammels of the Aristotelian syllogism dropped from her, whether as effect or as cause is immaterial: the fact itself is too notorious to be called in question.

Practical Distinctions and Directions grounded on the foregoing Theory.

4. Definitions are *Nominal* or *Real*. Again, real definitions are *Accidental* or *Essential*. And again, essential definitions are either *Purely-logical* or *Physico-logical*.*

5. A Nominal definition is one that is so only by name, and not in reality. Or it may be otherwise explained by saying that it does but put one name for another, on the supposition that the one substituted is more in use, and consequently better understood. Thus we may define *nonentity* by *nothing*; *innate* by *inborn*; *periphery* by *circumference*; *monologue* by *soliloquy*. In a nominal definition, only one word must be used, or if more than one, it must be such a combination as is understood in the manner of one word: for if we *collect* a meaning from two or more words, then there is a development of knowledge, and the definition is a real one.

* In this arrangement, and in the meaning of some of the terms, I have felt it necessary to deviate from Dr. Whately. He justly points out that Nominal and Real, as he, after others, explains them, furnish a distinct or cross division as regards the division into Accidental, Physical, and Logical; a fact which he complains that his brethren have overlooked,—so as to have introduced confusion and perplexity. I hope I avoid confusion by not making *Nominal* and *Real* a cross division; for I do not use the terms in the same senses as Dr. Whately, although in senses which custom fully warrants. Further, I do not follow him in the unqualified contradistinction of Physical from Logical definitions; my reasons for which may be collected from the foregoing theory.

In defining man, a *human-being*, or explaining To prevent, by the correspondent expression To *go-before*, the two words in each definition would most likely be taken as the syllables of a single word; and if so taken, the definition is a nominal one.* It is also a nominal definition, though the words may be several, which repeats the word to be explained in another grammatical shape; as when we say, Justice is the quality of being just.†

6. A Real definition, that is, a definition in reality,‡ is an explanation developed in some form of two or more words, with the effect that the thing defined is referred to some class, and the difference in some way indicated between it and the other things of its class. If we say *John is always talking of himself*, we declare a fact concerning John, but we do not use any form of definition. If, however, we say *John is a man that is always talking of himself*, we do use a loose form of definition, inasmuch as we refer our subject to his class or kind, *man*,

---

* The student will bear in mind that whenever the meaning is *collected* out of words put together to suggest it, there is the logical process of premises and a conclusion. (See chapter I.) But in combinations of frequent and familiar occurrence, the logical process has become unnecessary, and of such combinations we receive the meaning at once, as we receive it from single words. The description applies to all the familiar phrases of common speech.

† A subject which is *sui generis* hardly admits other than a nominal definition; as, for instance, Time, or Space. So far as these can be understood by human faculties, every one capable of thought has a full understanding of them: to explain them to one who did not already know what they are, would be impossible. We may say, Time is the measure of duration; Space is the measure of extent: but a clock, and a surveyor's rod, would, with almost as much propriety, come under these definitions; though the one is better called a measurer of time, (chronometer,) and the other a measurer of space, (chorometer.) Perhaps, the nearest approach we can make to a real definition of time, is, "That which exists between, and co-exists with events:"—and of space, "That which is occupied by the tangible things of sense, (or deemed tangible,) and exists where they are not." Kant denies the *objectivity* of time and space, making them parts of the mind itself,—receptacles into which the matter is poured, which the understanding subsequently *forms* into the things of the material universe. We may safely leave this dogma to the fate of German metaphysics in general, contradicting, as it does, a conviction quite as strong as that which attaches to all other things that we deem external.

‡ For, be it observed, *real* is not here used in the restricted sense assigned to it when we oppose it to *ideal*, but in its common and looser sense.

and then indicate the difference between him and men in general. Every form of real definition, strict or loose, has these two parts, namely kind and difference. Thus in defining man *a rational animal*, the latter term *animal* implies the kind or *genus*, and *rational* the difference, which is here called the *specific difference*.

7. An Accidental definition, commonly called a description, is that which explains a thing by its properties or accidents. Now a property is something which uniformly belongs to a subject, but is not so present to the understanding as to be thought at the moment essential, however it may be so. We say, for instance, that it is the property of a triangle, (not its essence,) to have its three angles equal to two right angles, but that it is its essence, (not its property,) to have three sides. An accident differs from a property by being separable from a subject; as for instance, to be right, or obtuse, or acute, is separable from the subject angle, in its general sense; in other words we may say, that to be right, obtuse, or acute, is accidental to an angle generally, though essential to each species. So when we define or describe John as *a man that is always talking of himself*, we describe him by what is accidental to his kind, though essential to John's special character. But we might go on describing him by accidents that are not essential, as for instance, that he lives in such a place, keeps such and such company, and so forth; all of which may form parts in our definition or description, and all belong to what is called an Accidental definition. We have next, however, to observe, that though we can define or describe an individual thing by what are purely accidental to it, as when we describe an individual plant by saying it is *a rose-bush growing at the farther end of the south-wall, and now in full blossom*, yet we cannot so define or describe a kind of thing: we then, in order to form an accidental definition or description, have recourse to the *properties* of the kind: as, for instance, in describing what a plant is, (that is to say, *any* plant, not a particular or individual plant,) we may say that it is *a natural production growing out of the earth from a seed or a root, very various in size, colour, and form, having within it a principle of life, and decaying when that principle is no longer active.* The description might be lengthened to any extent by adding other properties of plants; and the whole would be an accidental definition.

8. An Essential definition is one that limits its subject to that extent, neither more nor less, to which we design to adhere, in our subsequent inductive or deductive process; a purpose which it accomplishes by adding to its proximum genus, its specific (or characteristic) difference. Thus we define a square by calling it an *equilateral rectangle;* where rectangle is the proximum genus, and equilateral the specific difference; and, in a similar manner we define man by calling him *a rational animal.* An Essential definition is either Purely-logical or Physico-logical; purely logical when the subject is metaphysical or transcending nature; physico-logical when the subject is a natural object, or embraces natural objects.* Thus of the two definitions used as examples above, the former is purely logical, the other physico-logical.† It is true that a naturalist might not be satisfied with the definition given of man; but this would be, only because it employs not the mode of limitation which his system requires. He might find it necessary, for his end, to define man, *a mammal having two hands with thumbs opposable to the fingers, and three kinds of teeth, cutting, canine, and grinding.*‡ But the other definition, though formed with a different purpose as regards the future deductive process, is a physico-logical definition as well as the latter. In the latter, the characteristics forming the specific difference, namely *having two hands*, &c., have reference to a different artificial genus, namely *mammal.* Thus various for the different purposes of development, are physico-logical definitions: and if so, it will be readily conceived that those

* We say *subject* when we refer to what exists only in the understanding, namely, the knowledge of what an outward thing is, distinct from the outward thing so understood:—we say *object* when we refer to this outward thing. Hence the distinction into Subjective and Objective, which will occur in some future statements.

† It must be borne in mind that physical things, in our view, include both real and ideal things, and hence the definition of an ideal thing,—for instance, of a phœnix as *a bird fabled so and so*,—is a physico-logical definition.

‡ Genus and difference, if not capable of being respectively signified by a mere grammatical substantive, and mere grammatical adjective, will nevertheless still be so signified by constructed expressions equivalent to those two parts of speech; that is to say, by what, in "Principles of Grammar," are called a logical substantive and a logical adjective. Here, *a-mammal*, is the logical substantive,—what remains of the definition, the logical adjective.

purely logical must be still more subject to the choice or arbitrary determination of the thinker. In forming these, he is under no more than a prudential restraint; as, for instance, the custom of language, which ought to prevent him from defining a word quite apart from its usual meaning. One thing he has always to remember, that whatever limitation he chooses to give to the meaning of a word, to that he should strictly adhere in his subsequent development. Suppose, for instance, that he has defined Pride to be *inordinate self-esteem*,—he could not, under such a definition, justly propose, in any branch of his development, to treat of a proper or decent pride; for the very purpose is contradictory. To accomplish the purpose, his original, or some secondary definition, must assign a less limited meaning to the subject, as, for instance, by calling it self-esteem, simply; and then treating of it under the heads of an improper and a proper self-esteem.

First Note to Chapter III.

It may assist the student to the better understanding and application of what precedes, to quote, however we may have anticipated them, the following rules and cautions from Dr. Whately's Logic: "First, the definition must be *adequate;* that is, neither too extensive nor too narrow for the thing defined: for example, to define fish *an animal that lives in the water*, would be too extensive, because many insects and other creatures live in the water:—to define it *an animal that has an air-bladder*, would be too narrow, because many fish are without any. Or again, if in a definition of money, you should specify its being *made of metal*, that would be too narrow, as excluding the shells used as money in some parts of Africa: if again you should define it as *an article of value given in exchange for something else*, that would be too wide, as it would include things exchanged by barter. And observe, that such a defect in a definition cannot be remedied by making an arbitrary exception: if, for instance, a person were to give such a definition of *capital* as should include *land*, without meaning to have included it, and should then propose to remedy the fault by saying, that capital is *any property of such and such a description* EXCEPT LAND. Secondly, the definition must be in itself plainer than the thing defined, else it would not explain it:—in *itself* plainer, that is, generally; because, to some particular person, the term defined may happen to be even more familiar and better understood, than the language of the definition. And thirdly, (though this rule may be considered as included in the rule just given,) the definition should be couched in a convenient number of appropriate words. Figurative words are opposed to appropriate, and are apt to produce ambiguity or indistinctness: too great brevity may occasion obscurity; and too great prolixity, confusion."—"Tautology, which is a distinct fault from prolixity or verbosity, must also be avoided, that is, tautology which consists in in-

serting too much, not in mere words, but in sense; not so as too much to narrow the definition (in opposition to Rule first,) by excluding some things which belong to the class of the thing defined, but only so as to state something which has been already implied. Thus, to define a parallelogram, *a four-sided figure whose opposite sides are parallel* AND EQUAL, would be tautological; because, though it is true that such a figure, and such alone, is a parallelogram, the equality of the sides is implied in their being parallel, and may be proved from it. Now the insertion of the words *and equal*, leaves, and indeed leads, a reader to suppose that there may be a four-sided figure whose opposite sides are parallel, but *not* equal. Though therefore such a definition asserts nothing false, it leads to a supposition of what is false; and consequently is to be regarded as an incorrect definition." The effect may be further illustrated by the following examples. "If it be laid down that he who breaks into an *empty* house shall receive a certain punishment, it may be inferred that this punishment will not be incurred by breaking into an *inhabited* house:—if it be called a crime for people to violate the property of a *humane* landlord who *lives among them*, it may perhaps be inferred that it is no crime to violate the property of a landlord who is *not* humane, or is an absentee."

Second Note to Chapter III.

Connected with the laws of definition, and indeed involved in them, is the fixing of preliminary conditions, at least in the mind, before we enter on a dispute or discussion. It should be settled, for instance, what is the ground of dispute:—is it a real or verbal question, that is, a question concerning facts, or a question concerning the application of a word? A dispute otherwise interminable, may often be cut short if not adjusted, by the application of this test. Two persons are disputing whether A. B. was a man of genius:—"Are you," it may be said by one of them, "are you agreed with me that he was capable of such and such productions; if so, it is a question about the application of a word, and now let us see in what way custom authorizes the use of the word, and what sense agrees with our present meaning." Or suppose the parties use the word in exactly the same sense; then the dispute turns on facts or the character of the facts; to ascertain which, recourse must be had to inquiry, comparison, and general estimation. Further; the logician should be aware that on many questions which are given out for the express purpose of provoking discussion, a sensible person would express no opinion unless he were permitted to qualify it. Thus, for instance, the often mooted question: *Is a public or private education preferable?* This, as a general question, cannot be rationally answered:—we ought to know exactly what the education is, which, under each denomination, is proposed to be given, as well as the disposition of the person who is to be subjected to it, and his ulterior prospects in life. Thus limited, the question would present itself in a very different shape, and probably leave room for little or no difference of opinion.—*In the wars which closed with the Pacification of Paris in* 1815, *was Great Britain more indebted to her army or her navy?* Such a question in an assembly composed of the two different interests, would probably have produced, some few years ago, a very animated discussion; but it is one which, instead of discussing, it would be wise to

object to altogether, on the ground of its being impossible to be proved; that the operations of each service for which credit would be assumed, did not arise out of, and take their character from, the existence of the rival service:—the question is nearly like such a one as this,—*Is the heart or the head more useful to the rest of the body?* We might indeed reasonably ask, *whether Great Britain should seek to be a great naval, or a great military power?* Such a question would permit a decision on rational grounds; but in proportion as we become rational, we leave less room for contention, and the other question would probably be preferred by those who propose subjects expressly to provoke discussion.—*Is the decline of nations more owing to the misconduct of governments, or the degeneracy of the people?* Here two *separate* causes are assumed, before it has been established that they act separately. We might as well ask, *whether the decline of the bucket into the well is more owing to the rope or the wheel?* It would indeed be reasonable to inquire, *whether wrong principles and practice in government do not produce degeneracy in the people?*—and, *whether degeneracy in the people, does not leave little chance of a good government to reclaim them?* The determination of these inquiries, which would be attended with little or no difference of opinion, would show that there is no rational ground for the alternative proposed in the previous question.—*Is a convulsive revolution, such as we have of late so often witnessed on the continent, mischievous or beneficial to a nation?* A sensible reasoner would affirm neither side of the question, unless permitted to qualify, and then he would affirm both: it is mischievous at the time; it is likely to be beneficial in some uncertain number of years to come. We thus walk aside from the snare, for which, it may be, the question was put. Had the answer affirmed such a revolution to be beneficial, it would have opened the means of rhetorical delusion specified in the last Chapter, (Section 33.) As it is, the answers are quite innocent; the one affirms an experimented fact; the other permits no practical inference; since, though it is true that a man may get a new and a better house by being burned out of an old one, we cannot rationally act upon this fact, and set a house on fire to the imminent danger of the inmates and the neighbourhood whenever a new one is wanted.

CHAPTER IV.

DEDUCTIVE LOGIC.

1. Deductive logic is the art of developing in words, and making special, *for one's own conviction and satisfaction*, the knowledge obtained by the inductive process. It differs from Rhetoric by stopping short at the object stated. Nevertheless, as Logic ought to be exercised so as to prepare for Rhetoric, every development of deductive logic must be considered imperfect, unless, while it convinces and satisfies oneself, it is also fitted to convince and satisfy all, who have the same previous knowledge.

Theory of Deductive Logic.

2. We have seen that, in the inductive process, every act of the understanding includes three things, the thing known, the thing by which it is known, and the knowledge gained. Being gained, the knowledge remains abstract from the things, not indeed ever present to consciousness, but revivable upon occasions that require it, by the presence of real or of ideal things, or by means of a sign audible or visible. But when the knowledge is revived by its proper occasion, it does not always bring with it all the things which suggested it; and we have to develop these things by that conscious effort which we call *thinking*. This is, in other words, to go back to the steps (not exactly, which would scarcely be possible, but virtually, to the steps) which led to our knowledge: and such development is the practice of deductive logic; which development never includes, in strict theory, more than we *already* know. Thus, for instance, we may meet with some instance of kingly magnificence which awes our thoughts, so that we understand, for a moment, such condition of man as something different from the ordinary lot of humanity; but considering afterwards, as a part of our knowledge *already* acquired, that a king is but a man, we shall conclude that kings are not exempted from the lot of other men, but, like them, are mortal. The development of such knowledge may be expressed in words by a single proposition, namely, "Kings, who are but men, are mortal." Or it may be expressed in three propositions, which represent the three things that originally constituted our knowledge: namely, 1. "Every man is mortal: 2. Every king is a man: 3. Therefore, every king is mortal." When we develop our knowledge in this manner, the three propositions are a syllogism. When we develop it in any other way which forces assent from a person possessed of the pre-supposed knowledge, the syllogism is virtually included in the expression; because the three things which the syllogism represents, are included in every act of the understanding. Hence, the syllogism is properly resorted to in all cases of doubt or difficulty, for the purpose of testing the knowledge gained, with relation to the conclusion which it necessarily includes.

Note to Section 2.

Our Syllogism is the *informal* Syllogism, by which is meant the Syllogism that makes no use of the doctrine of comparison between extremes and middle terms, which belong only to the doctrine of the formal syllogism of Aristotle. The syllogism given as our example above, happens to exhibit those terms in the construction of the several propositions; but this is accidental to our syllogism, and not essential or important. In our doctrine, each premise of the syllogism is one expression with one meaning; and, in the instance above, is the statement, in each, of a known truth or fact. But these facts are no sooner stated in connection, than they inevitably suggest the conclusion which is expressed by the third; and the whole of them are now one expression with one meaning. To ask why they are so, or to take in hand a demonstration of what is thus attained, is a question, and a proceeding, as absurd as it would be to ask why a rose is fragrant, and to set about a verbal demonstration that it is so. Accordingly, with men of sense and education, but not so educated as to be trammelled by scholastic logic, the syllogism in actual use, is the informal syllogism; and to this they have recourse, when, in the inductive process, not being quite satisfied with the grounds on which they have come to some *inference*, they *deduce* the process in a syllogism, that so the grounds and the conclusion (inevitable in the deduction) may be clearly set forth, and the defect, if any, may be seen; which fault will always be found in the premises, and never in the conclusion.

But say the Aristotelians,—that is, they who *are* trammelled by scholastic logic,—we find in the practice of reducing all syllogisms to the demonstration of extremes and middle term, a wonderful power in sharpening the intellect. It may be so: riddles, charades, and conundrums have this power also. But is it an exercise which sharpens the intellect for the high practical purposes of life? May not a person acquire great skill in the reduction of reasoning to the Aristotelian formulas, without any benefit, nay even with prejudice, to the natural powers of the understanding exerted for the ends just alluded to? He who makes use of a complicated instrument to effect that which nature has fitted him to do with his naked hand, may possibly fail in using the instrument, though he could not fail in using the natural means. We reserve our proofs of what is here suggested only as possible, to another opportunity. If we shall be able to show that Dr. Whately himself is guilty of a gross fallacy, that of the circle, in endeavouring to establish the claims of the Aristotelian syllogism, the cause of the error must be set down, in him, not to the want of great natural judgement, which Dr. Whately, of all men, cannot be accused of, but to some defect in the employment of his *instrumental* means of coming at his conclusion. (See the next Chapter, Section 9.)

There is an enormous delusion in the doctrine of the Aristotelian syllogism, which may be taken notice of before concluding this note. In this doctrine it is pretended that the reasoning process can be exhibited distinct from the subject-matter of reasoning. What we affirm, (and the affirmation, we presume, carries conviction along with it,) is, that where there is no subject-matter to be understood, there can be nothing under-

stood. When we say—Y is X, but Z is Y—we affirm what is not true, and there is no conclusion: but if proviso is made that Y shall be the same as X, and Z the same as Y, a conclusion follows; and the cause is, that, by the proviso, X, Y, and Z, become real subject-matter.

3. But though, in strict theory, the development of knowledge never can include more than we already know; we cannot, in practice, always distinguish between the inductive and the deductive process. For in *thinking*, that is, in the effort to develop our knowledge, it is the proper course, when we do not find in our previous experience or accredited information, sufficient ground for what we presume we know, to go back to the inductive process, in order to collect the proofs or disproofs of such presumed knowledge. Such proofs are called *External arguments;* and in the practice of deductive logic, they very often occur among the *Internal arguments;* which in strict theory are alone proper to Deductive Logic. Hence the principle of deductive logic, as it is to be practically conducted, may be laid down as follows: It is, to develop our knowledge, by following it into that which is necessarily included in it, but which we do not at once recognize as so included, either from defect of attention, or *because our knowledge is assumed before we have legitimately reached it.*

4. Every single word is, as we have seen, the sign of abstract knowledge, and, if legitimately used, includes all the steps by which the knowledge has been gained, and every step was an act of the understanding, which, as already stated, always implies the co-existence of three things. Now when the knowledge, which we have abstracted to the utmost degree that our faculties can reach, or the words we use can signify, is to be deduced and specially applied, the universal method of logic is this: to join words together which have a separate or abstract meaning, so that each loses its abstract meaning, by each helping the other to suggest a more special meaning, the expression formed by the junction of the words, becoming—the instant they are joined—only one expression for the one more special meaning. This is what we called, joining words together to make sense; and it is presupposed that while they make sense, they shall also make grammar, that is, be accurate forms of construction. Thus, for instance, *red* and *earth*, are respectively signs of abstract knowledge: so likewise are *Time* and *flies:* so like-

wise are *every* and *man:* so likewise are *is* and *mortal.* But *red earth* being joined make sense, and are one expression for one meaning, which meaning is special in comparison with the separate meaning of *red* and the separate meaning of *earth.* The same is to be said of *Time flies* and of *Every man* and of *Is mortal*, when the respective words are joined. And again, with regard to the last two expressions, each of which is now to be esteemed only one logical element or part of speech, the moment we join them together, we find they make sense, and that sense is special in comparison with the separate meaning of *Every man* and the separate meaning of *is mortal.**

5. The grammatical function of a sign, whether single, or compounded of several that form one expression with one meaning, does not affect the previous statement. It is true that a sign whose form indicates that it is only a *part* of speech, carries, in that form, a warning that we are not to rest in its separate meaning, but to await the junction of another sign for some more special meaning intended. But a sentence completely constructed, though it does not carry the same warning in its form, is nevertheless,—if not the final sentence, but one of a link in the chain of expression by which the thought will at last be developed,—as much a part of speech as any individual word recognized by grammar as a part. The complete logical expression or WORD, is nothing less than the whole of the means used to develop the knowledge which the thinker chooses to unfold at the time; and it may amount to a large discourse, which being completed, is one expression for the knowledge unfolded; of which the

* So, *man*, *horse*, *cards*, *a*, *horseback*, *on*, *of*, are each a single grammatical word, each implying abstract knowledge. Again, *a-man*, *a-horse*, *on-horseback*, *of-cards*, are, respectively, signs of meaning less abstract, that is, of knowledge in a degree more specially developed, the signs being formed of mere grammatical words joined by grammar and by logic. And again, *a-man-on-horseback*, *a-pack-of-cards*, are signs, similarly formed, of meaning still less abstract. The examples, a little improved on those in Aldrich, are given in Whately's Logic (Book II., Ch. 1, § 1) as instances of Simple Apprehension, Incomplex and Complex; distinctions founded, like the Aristotelian doctrine generally, on essentially wrong notions of the way in which language is the exponent of thought. Dr. Whately, as if suspicious of the fact, expresses himself with some caution in his later editions, as compared with the earlier.

several portions are properly deemed parts of speech in Logic, though devoid of forms to imply that they are parts in grammar.

6. But though a sentence may be, in Logic, and commonly is, only a part of speech, yet the difference adverted to, namely, that it does not carry in its form a warning to wait for meaning to come, enables us to rest in its meaning, if we please, although the rest may be temporary. A sentence may therefore be described as an expression that *proposes* or lays before the thinker the development of his knowledge: as "Time flies:" "Every man is mortal:" "A king is but a man." It is therefore called a *proposition*. A grammatical part of speech only begins, or continues, or completes such a proposition, and by its form indicates that it is to be understood as doing no more: for instance, Time—; Man—; Is—; Every man—; Time as it flies—; A king, who is but a man—. These, by their form, are evidently only parts of propositions; that is they are grammatical parts of speech. Among these we may distinguish from the *mere* grammatical parts, such as (though grammatical also) exhibit a development to a certain extent, though not a development in which we rest. Such compounded parts of speech we have been taught, in grammar, ("Grammar on its true basis,") to call *logical* parts of speech.

Distinctions and Directions to assist in the Practice of Deductive Logic; based on the foregoing theory.

7. When we intend to develop our knowledge, we have first to choose the form of expression by which the knowledge to be developed shall be signified. The expression may be a single grammatical noun, or a logical noun, or a proposition. Thus, *Socrates; Man; Pride; Knowledge;* are single grammatical nouns;—*The death of Socrates; The reason of man compared with the instinct of brutes; Pride of birth; Knowledge of the world,* are logical nouns:—*Knowledge is power; Virtue is its own reward; It is Education that forms the mind;* are propositions. Of these, the subjects expressed by single words are the widest, including an indefinite number of subordinate subjects to be expressed by logical nouns, or by propositions. The subjects expressed by logical nouns, or by propositions, are more limited; but are still resolvable into subordinate subjects to be expressed in the same way.

8. When the subject to be developed is expressed by a single word, the first proof that can be given, logically, of the existence of the knowledge presumed to be included under it, (though the proof may not always be required,) is its expansion in what is called a *Definition.* All knowledge consists in being aware of the relations in which the thing known stands to oneself and to other things. Suppose then, a subject to be expressed by a single word, it is almost always possible, as we have seen in the previous chapter, to class the subject with other things; which are therefore said to be of the same *genus* or kind; and then to distinguish it from these things by stating its *difference. Genus* and *difference*, as we there saw, form a definition. Each of these may sometimes be expressed by a single word, as in defining Socrates to be a *Greek philosopher*, Man to be a *rational animal*, Pride to be *inordinate self-esteem.* But it may not be possible, and if possible, it may not be sufficient for our object, to begin thus briefly the development we propose; or if we so begin, we may add much more, so that an essential definition becomes an accidental one, or description. Thus, we may carry out our definition of Socrates into all the particulars of his life, till the *difference* between Socrates and others of his *kind*, amounts to a biography of Socrates. Suppose for another instance, that we have to define so common a thing as a chair or a table, it must be done by genus and difference,—by stating what *kind* of thing it is, and how it *differs* from other things of its kind. Thus both chair and table may be called *an article of furniture;* that is their genus: of a chair, the difference is, *so far raised from the ground, and so adapted, as to receive a person in a sitting posture:* of a table, the difference is, *so far raised, &c., and so adapted, by having a flat surface, as to hold readily for the hand whatever may be placed upon it.* Again; suppose we have to define such a subject as Generosity:—we must first seek for a *generic* term, such as sentiment, and then add words to *specialize* the term; as, "Generosity is *the sentiment which takes pleasure in conferring benefits.*" There are wider meanings of the word than this; but this may be all the meaning which the further development is intended to carry out.

9. If the subject to be developed is expressed by several words, as, for instance, *A knowledge of the world*, the general

term knowledge is evidently limited, being in fact thus far developed. Still, as with a subject expressed by a single word, there will remain an indefinite number of points or purposes of development, at the choice of the thinker. But if the subject is given in the shape of a proposition, as, *A proper knowledge of the world is favourable to virtue*, there is then only this one proposition to be established,—in other words, only one purpose of development. Now the means of development are what are called *arguments;* and we have next to inquire what is an argument.

10. An Argument, often called a Reason, is a proposition whose truth being admitted, the truth of the proposition which it is used to establish must also be admitted; as "Kings are mortal, for *they are but men*:" "John lived in London; for *he lived with his uncle*." We say that the truth of the proposition in italic being in each instance admitted, requires us to admit the proposition which precedes, to be true:—but requires whom?—certainly not every one; it requires the admission only from those who, in each instance, have certain further knowledge; namely, as regards the first instance, this further knowledge that *men are mortal;* and as regards the second instance, this further knowledge, that *John's uncle lived in London*. The further knowledge supposed in the first instance is knowledge that every body is presumed to have, and the argument will as widely be received as valid; but the further knowledge supposed in the second instance may be in possession only of a few; only to which few can it be offered as an argument; but for them, it is quite as valid as the argument in the other instance. We see, then, that in the development of knowledge as in the induction, there are three things present at every step or stage of progress, and these three things in the deductive procedure, may be named the *datum*,—commonly unexpressed, but always present in thought,—the *argument*, and the *conclusion*. When these are all expressed in the order here mentioned, they form the syllogism of deductive logic; as, "Men are mortal; Kings are men; therefore, Kings are mortal;" "John's uncle lived in London; John lived with his uncle; therefore, John lived in London."

11. Arguments have technical names derived from three

sources. i. From the *Topics* whence they are taken. ii. From the *Data* to which they are addressed. iii. From the *Forms* of development. Our practical distinctions must be continued by a statement in detail of the divisions and subdivisions under each of these heads.

Practical Distinctions continued: (i.) Names of Arguments from the Topics whence they are taken.*

1. *External Arguments—Experiment and Testimony.*

12. If the argument or proof which we seek under a general head or topic, is not already a part of our knowledge, such general head or topic will be either Experiment or Testimony; and the argument will be derived externally. It will not, in this case belong to *deductive* logic, but *inductive*: that is to say, it will be knowledge yet to be sought and made our own, either by actual experience, or by admitting the experience of others in place of actual experience. Now all our knowledge is originally suggested by external things, and therefore differs not, in its beginning, from that belonging to the topics here proposed under the two names *Experiment* and *Testimony*. But the reason for the distinction is this; the arguments sought after under the heads called *internal*, are presumed to be included in the subjects which we undertake to develop; because to understand the term designating the subject, is to have the knowledge which that understanding necessarily includes. Thus, for instance, to understand what is meant by a plant, a mineral, an animal, is to know what is a plant, what is a mineral, what is an animal: to understand what is meant by pride, or by virtue, is to know what constitutes pride, what constitutes virtue. But the knowledge here supposed is ordinary knowledge; not the recondite relations which the scientific experimentalist reaches; relations which, as to a plant, a mineral, an animal, form the physical sciences, Botany, Geology, Zoology; any treatise or development of which, must be founded on proofs called experimental. Thus, again, if knowledge is proposed to be

* The *Data* and *Topics* of arguments are quite as necessary to be considered in Rhetoric, as in Deductive Logic; and they are accordingly exhibited, with appropriate differences of view, in the Manual of Rhetoric.

developed from the proper names *John* or *Socrates*, all we can presume the names to include, is, that there is, or was, a man called John or Socrates:* if more than this is developed, or sought to be developed, it must be, from the peculiar knowledge which the thinker enjoys, the fruit of his peculiar experience, or of the information he derives, as a learned man, from the stores of history. The scientific knowledge thus induced under the term, is not *necessarily* included in it till the induction takes place; and even then, the arguments are fitted to convince only those who have the knowledge, and not the generality of persons, who use and understand the terms no further than in their ordinary sense. Deductive logic is, however, the art of developing in words such knowledge as we have; and therefore if the thinker has the knowledge here assigned to the two heads called external, the knowledge is, to him, internal, and the distinction a name without a difference; though, as a name, it will be useful, when we have to employ logic as a basis for rhetoric.

* Hence Mr. John S. Mill denominates a proper name a *non-connotative* word. Connotative, according to him, is that which notes something, and, along with it, something more, or, in addition. Thus the word *man* is connotative; for while it notes any one man, it notes his kind, or all that constitutes him a man. Thus again the word *white* is connotative; for while it notes the quality, white, in any one thing, it notes or implies it in all other white things. On the other hand, *John* and *whiteness* are said to be non-connotative; and we may perhaps exemplify the reason given for this by saying, that they are words incapable of being used in predication otherwise than specially: we cannot say, for instance, "This man is John" by virtue of any general knowledge included in the word, but only by virtue of our special accidental knowledge that such is his name: neither can we say of anything, except of whiteness itself, that "It is whiteness;" for the word whiteness is so grammatically conditioned as to be *immediately* applicable only to our knowledge of what whiteness is, and *not immediately* to the white things from which that knowledge has been derived.—In thus explaining the distinction sought to be enforced by the term non-connotative, we wish it to be seen that it arises entirely out of the Aristotelian doctrine of predication: and its utility or inutility must be estimated by the utility or inutility of that doctrine. Whether, with just views of the relation which language bears to thought, *John* and *whiteness* are not connotative, as well as *man* and *white*, we leave *our* student to inquire.

2. *Internal Arguments—Definition, Etymology, Enumeration, (not Induction,) Genus and Species, Cause, namely, Efficient or A-priori, and Final or A-priori, Effect or A-posteriori; Antecedents, Consequents, Adjuncts;* Comparison, *namely, Similitude, Analogy or Parity of case, Contraries, Proportion, and A-fortiori.*

13. When, having laid down some point or purpose of development, we go on to argue the truth of what we assert by appealing to the nature of our subject, as it is, or as it might be exhibited in a definition, we are said to reason from DEFINITION. If, for instance, we desire to develop the knowledge contained in the proposition, Man is accountable for his actions,—the argument may be, that he is a creature endowed with reason and liberty; which is a definition of man's nature. This is an argument by virtue of the datum, that every creature endowed with reason and liberty is accountable for his actions; and both being admitted as a part of our previous knowledge, the conclusion is inevitable. Or if we desire to place the truth evidently before us in words, that certain lines are equal to one another, the argument may be, that they are radii of the same circle. This is an argument by virtue of the datum, that the radii of the same circle are always equal; and both being admitted as belonging to our previous knowledge, the conclusion is again inevitable.

14. When we develop our knowledge from the original sense of the word that stands for our knowledge, we are said to reason from ETYMOLOGY. If, for instance, we desire to develop the knowledge, That the idle have no relaxation,—the argument may be, that the word relaxation originally signifies, the loosening of what is tight. Borrowing from another topic hereafter mentioned, namely, Analogy or Parity of case, we add to the argument from Etymology, the further argument, That as the idle never apply, or draw their faculties *tight*, so they can never be said to relax their faculties. The former is an argument by virtue of the datum, that the idle do not loosen what is Tight; and the latter an argument by virtue of the datum, that Not to draw the faculties tight and not to apply them, are expressions that mean the same thing. All this being admitted as a part of previous knowledge, the conclusion is inevitable.

15. When we develop the knowledge we entertain under a general term, or a general proposition, by detailing the particulars which constitute our knowledge, we are said to reason from ENUMERATION. Thus, for instance, we develop our knowledge of what a dozen means, or a score, by counting up to a dozen, or a score inclusively. This is an argument by virtue of the datum that the number so counted is a dozen, or a score; and the conclusion follows inevitably. Thus, again, if we wish to develop the knowledge contained in the proposition, A fine art always addresses, as its appropriate object, our imaginative sensibility, through the sense of hearing or of sight; our first argument may be an enumeration of the fine arts, namely, Poetry, Music, Painting, Sculpture, accompanied, in each instance, by the more special proposition that Poetry addresses, as its appropriate object, our imaginative sensibility, through the sense of hearing; Music addresses, &c., through the sense of hearing; Painting addresses, &c., through the sense of sight; Sculpture addresses, &c., through the sense of sight. This enumeration is an argument by virtue of the datum, that Poetry, Music, Painting, Sculpture are all the fine arts; and both being admitted as a part of our previous knowledge, the conclusion is inevitable. Thus, again, if we wish to develop our knowledge, that a heavy body lifted from the earth, has always fallen to the earth again when the sustaining power was removed, our argument may be, the enumeration of A, B, C, D, &c., which in our own experience or that of others, has, in each instance, fallen to the earth under the circumstances stated. This again, is an argument by virtue of the datum, that A, B, C, D, &c., are all the things, or represent all the things, on which the experiment has been tried; and both being admitted as a part of our previous knowledge, again the conclusion is inevitable.

The argument from Enumeration is sometimes confounded with the argument from *Induction;* but Induction as we have seen, is not an internal argument; and the conclusion it suggests is not included in the premises, and therefore is not a *necessary* conclusion but an inference, although we do not the less receive it as true. Thus, for instance, having to ascertain whether it is a truth or general law, that every heavy body being lifted from the earth, will fall again to it if every

intervening thing be removed, we have recourse to experiment; and the experiment answering our expectation, we then infer that as A, B, C, D, &c., *have fallen* again to the earth after having been lifted from it, so all bodies whatever *will fall* to earth under the same circumstances, in other words, that this is a general property of bodies near the earth's surface. Now, the inference here is not included in the premises; the necessary conclusion from which, is, that A *has* fallen, that B *has* fallen, &c., not that Z, Y, X, &c., *will* fall. And this sort of conclusion is called the Inference of Physics.

Yet the difference between the argument from Enumeration and Induction is done away with, by conceding the knowledge, a knowledge which all people must acquire,*— that

* But why must they acquire it? The philosophers of the Scottish school here come in with what they call a fundamental principle of belief. I am glad to avail myself of the objections to that dogma, which one of their number, Mr. James Douglas of Cavers, thus urges: "That Reid, Stewart, and Turgot, have been mistaken, in proposing such an *original* law of thought, as a belief in the continuance of the laws of nature, will easily appear. That can never be an original proposition which consists of slowly acquired terms. Had we an innate idea of nature, of laws, or of permanence, then we might have such an ultimate and instinctive principle: but since the notion of nature is very gradually acquired, and since the term laws is metaphorical, the absurdity of our forming a conclusion while we are yet unfurnished with the premises, will be abundantly apparent. Should it be said that this law of thought remains dormant till we become acquainted with the meaning of nature and of laws, though this supposition is sufficiently absurd in itself, it may be further observed, that our belief of this permanence of the laws of nature, is certain and uniform: but no certain conclusion can be attached to variable terms, such as the very complex and fluctuating notions of nature and her laws. Unless we had within us a model of what nature is, and what her laws are, and also whether continuance is to be understood in an absolute, or in a qualified sense, it would be impossible to arrive with any certainty at the conclusion, which is thus made the foundation of our belief, and of reasoning. The truth is, here is a confusion between acquiescence and belief. To acquiesce in the regularity of nature, is one of our earliest habits, but to believe in the permanence of the laws of nature, is one of the ripest acts of the understanding. The process from childhood does not seem to be well understood—the child receives all things, according to the philosophic expression of Wordsworth, in "a wise passiveness." It has no doubts, and therefore can have no belief. The permanence of the laws of nature mould the thoughts of the child to their own continual recurrence: what is still more, the structure of his own frame corresponds and fits in with the laws of external nature. Not only are all his thoughts moulded, for example, to the succession of day and night, but the structure both of his

where an experiment never has failed, it never will fail. The *datum* will then be, As A, B, C, D, &c., have fallen to the earth after being lifted from it, so Z, Y, X, &c., will fall under the same circumstance: the argument will be as before that A, B, C, D, &c., have fallen: from which argument the conclusion by virtue of the datum, That Z, Y, X, &c., *will* fall; now follows, as necessary and inevitable, because the premises now include it.

16. When we develop our knowledge by going back to knowledge that includes it, instead of using an argument that comes immediately under the knowledge we purpose to develop, we are said to reason from the GENUS. Thus if, in order to develop our knowledge, that man will be punished or rewarded, for which our special argument might be, that he is accountable for his actions; we choose to use the more general argument, Every creature endowed with reason and liberty is accountable for his actions; we shall properly be said to reason from the *genus:* since, *every creature* endowed with reason and liberty, includes the *species*, man. So again, if we wish to develop our knowledge, that a devotion to poetry quickens the imaginative sensibility, we may take our argument from the general definition of the fine arts instead of the definition of poetry in particular, and the argument will then be from the genus instead of the species, although it will also be taken from the definition or nature of the fine arts.

---

body and mind fit him for the alternate change of light and darkness, of activity and repose. The moment that any doubt should occur to him,—which can only be after his reason is exercised, and his thoughts have taken a free range,—that moment they would be repelled by a principle already familiar to him, not indeed in words, but implied in our earliest reasonings, the principle to which Leibnitz has given the name of sufficient reason. This is not an original principle itself, but is merely the logical form of that original principle which we have already pointed out, that every change refers to a cause. Where no adequate cause has operated, no change can have taken place. The course of nature must continue, till the power which gave it that course changes its direction. There can therefore be no reasonable doubt as to the permanence of the laws of nature, except in those cases where the interposition of God can be reasonably expected. Thus, then, we need not multiply original principles without necessity, but may rest our belief in the continuance of the laws of nature upon that fundamental belief that every event has a cause."—*The Philosophy of the Mind: by James Douglas, Esq., of Cavers.* 1839. page 226, *et seq.*

An argument from the SPECIES would of course be from the definition of poetry in particular; but such argument would be more eligibly assigned to the topic definition, leaving to the topic *species* only what is otherwise called *example* or *instance*. Thus, if we sought to develop our knowledge that Industry is the source of all the blessings of life, we might give as an instance of one of these blessings, the improvement of the mind by study; which is an argument by virtue of the implied datum, that this is but one of similar instances, which instances, if completed, would form the argument called *Enumeration;* and that this instance may be rationally accepted in place of all.

17. When we develop our knowledge, by so much of the nature or *definition* of the thing known, as accounts for certain effects, we are said to reason from the CAUSE. Thus, in order to develop our knowledge that Pride is odious, we may use for our argument, the proposition, that it offends the self-love of others. This is an argument by virtue of the datum, that every thing which offends the self-love of others, is odious. Again; if we wish to develop our knowledge, that wine largely and frequently drunk, is a poison, we may use for our argument, that it tends to destroy the constitution; which is an argument by virtue of the datum that every thing which tends to destroy the constitution is a poison.—But note, that in *deductive* logic, nothing can be called a cause which is not already admitted to be one. The discovery of natural causes is the business of the physical sciences, and the conclusion belonging to them is *Inference;* a conclusion which is never included in the premises, and is therefore never a *necessary* conclusion: it is always a conclusion which may be set aside by subsequent experiment. Thus, for instance, we may conclude from the fact, that a man has died after having eaten of a certain herb, that it is a poison: this is an inference. But if, subsequently, we find that thousands of people have eaten of the same herb with no ill effect, we are obliged to renounce that inference, and infer that the herb is not a poison. In neither case, is the inference a conclusion belonging to deductive logic, but an inference of physics, and assignable to inductive learning.—The examples given above are examples of what is called *Efficient* cause. From this we have to distinguish what is called *Final* cause. A final cause

is, in other words, the motive, end, or purpose, on account of which something has existence: thus when a man dies by *poison*, and by his *own act*, these are the efficient causes of his death: the final cause, may be to escape from the tortures of the rack, or the agonies of insanity, or despair.

18. When we develop our knowledge by so much of the nature or *definition* of the thing known, as may make its nature evident in what it produces, we are said to reason from the EFFECT or effects. Thus, in order to develop our knowledge that Pride is odious, we may use for our argument the proposition, that all persons shun the society of the proud. This is an argument by virtue of the datum that a quality must be odious which makes all persons shun any one who has it. Thus, again, we may develop our knowledge of a diseased constitution in a person who drinks wine largely and frequently, by affirming that the disease is the effect of such practice; which is an argument by virtue of the datum that the disease uniformly follows the practice, and that whenever there is this uniformity of sequence, that which precedes is the cause, and that which follows is the effect. But note, that in *deductive* logic, nothing can be called an effect which is not already admitted to be an effect with reference to a correlative cause. The discovery of natural effects is the business of the physical sciences, and the conclusion belonging to them is inference. If, for instance, in any particular case, there is room to suspect that disease in a man who drinks largely and frequently of wine, is not the effect of that practice, the suspicion must be admitted so far as to warrant the search after the proper correlative cause; but the certainty or uncertainty of the inference resulting from such search, has nothing to do with the certainty of the deductive conclusion; for this being contained in its premises, is always a *necessary* conclusion. Yet it is to be remembered that the premises will be faulty, if they state as a certainty what the inductive inference only makes probable.

19. The phrases A-PRIORI, and, A-POSTERIORI, often occur as terms belonging to logic; implying the same things as argument from Cause, and argument from Effect: but their use instead of these terms requires explanation. Among the ancients, there prevailed an opinion that all knowledge flowed from certain original truths implanted in the mind,

and that every special truth was but a deduction from these original truths. But if, as modern philosophy teaches, all the knowledge we can reach, is the result of experience, while we admit that the faculties of our race are such as to be affected by the same experience in the same way, it follows, notwithstanding this admission, that, taking the expression absolutely, there is no such thing as *a-priori* knowledge. But taking the expression relatively, that is, assuming certain knowledge to be inevitable where there is the capacity for it, and also the ordinary occasions of suggestion or of learning, then all reasoning which is deductive will be *a-priori* reasoning, and all inductive reasoning will be *a-posteriori* or from facts, that is from new facts. We may hence define *a-priori* reasoning to be that which proceeds from truths already known, and merely deduces the special truths included in them; while *a-posteriori* reasoning is that which infers general truths from particular truths, which particular truths do *not necessarily* constitute them, but are admitted to be quite sufficient to establish them as science, from which we are entitled to reason deductively, that is, on the *a-priori* principle. Thus, we conclude *a-priori* or beforehand, that a man will die as the effect of having drunk a mortal poison without an antidote: thus, again, we conclude *a-priori*, that pride will render a person odious to all who are made to feel its effects; and thus, again, we conclude, *a-priori*, that lines which we propose to make radii of the same circle will be equal to one another. But in every instance, (and it is the same in all instances,) the *a-priori* knowledge has been obtained *a-posteriori*: thus, we know that the man will die because previous effects had led us to infer the drug as a cause; thus we know that pride will make a person odious, because we have inferred that sentiment as the cause, in a variety of observed effects; and thus we know that lines which are radii of the same circle, are equal to one another, because experience has made us aware that in knowing what a circle is, the equality of its radii is included in our knowledge.*

* This point is in discussion. The old philosophers would have insisted that the knowledge of the properties of a circle, is original knowledge in man. Dr. Whewell, following the German transcendentalists, considers it to be an *explicated idea*, which indeed seems to come to the same thing. Dugald Stewart considers the definitions of geometry to be hypotheses. As to myself, I may seem, in an opinion I expressed many

20. The word *cause* means a permanent antecedent, or what we have found, by experience, to have a certain consequent, or certain consequents, and which we hence call an effect, or effects. But there are antecedents on which we cannot yet rely, so as to call them, with certainty, the *causes* of the consequents: and when we use such antecedents as arguments in order to infer the consequents, we are said to reason from the ANTECEDENTS. Thus, when a man has died after taking a certain drug which was not previously known to be poisonous, but which we now call so, we may be said to reason from the antecedent. This, however, is an inductive argument, and not deductive. In making it deductive, we assume a datum which logically necessitates its conclusion without diminishing the doubt accompanying the inference; as, When, after taking a drug, a person soon dies, it is *very probable* that the drug has killed him: This person took, &c., and soon after died: therefore it is *very probable* that his death was caused by the drug.

21. The word *effect* means a permanent consequent, or what we have found by experience always follow an antecedent. But there are consequents on which we cannot yet rely, so as to call them, with certainty, effects; and when we use such consequents as arguments in the development of our knowledge in order to infer the antecedents, we are said to reason from the CONSEQUENTS. Thus, when a man has died, and exhibits certain marks usual in people who have swallowed poison, we infer that he died through poison. But this is an inductive argument: the marks may proceed from other causes: and in transferring it to the deductive syllo-

years ago, almost to have anticipated Dr. Whewell's. In my Outline of Sematology (Beginnings of a New School, &c., First Essay, foot-note 150) I ask whether the definitions in geometry are not expressed "notions (knowledge) of and belonging to quantity, which, by the condition of the mind, we must reach, if setting aside the sensible instances of a line, a circle, &c., we try to conceive them perfect." This mode of explaining what I meant, I now perceive to be defective. How conceive them, an idealist will say, nature not certainly furnishing the patterns, unless the ideas were already in the mind? But I had no intention to describe them as ideas, that is conceptions. I meant and mean to say, that the definition of a line, &c., is nothing more than the statement of our knowledge what a straight line, &c., is; and how we get this knowledge independently of any idea of the thing, I have elsewhere shown: See Chap. II. Note to Section 10, page 112; "But, say the Idealists," &c.

gism, we must take care to assume, in the datum, no greater certainty of knowledge than we have reached in the inductive process.

22. When we develop our knowledge by entering on details which are not *necessarily*, or, as the ancient logicians consider, *essentially* included in the name of the thing known, we are said to reason from the ADJUNCTS or *Accidents* of our subject. Thus we may develop our knowledge of *John*, by all that constitutes the history of John. The name *John* itself is nothing more than the proper name of one of our species, and it does not necessarily or essentially include more knowledge than that John is a male of our species. All beyond this we may call the adjuncts or accidents of John. These adjuncts or accidents are nevertheless essential to the individuality of John when they have occurred; and all we can truly say of them, is, that they do not belong to the individuality of any other person.

Essence, in the doctrine of the ancient logicians, is that which makes a thing what it is. Thus *rationality* is the essence of man: and yet an idiot is not rational, though we still count him a man. An accident is that which belongs to some individual thing of the kind, but not to others.* If we are praising the pleasures of a country life generally, we may dwell on the sublimities of mountain scenery, or on the sweetness of shady groves: but every country has not mountains; and shady groves are pleasant only where the sun is scorching and oppressive. These, therefore, are adjuncts or accidents, and are non-essentials. Some accidents have been called *properties*: it is, for instance, the property of man to become gray: but this is a property belonging to man in old age, and not always even then. Again, it is a property of man to be capable of laughing. It may be doubted whether this is a property, or essential to the nature of man; but the discussion involves a point of no moment. Provided we understand the meaning of the words as they have been, and as they are still liable to be used, the theory of Logic on a true foundation requires no other statement than this,—that whatever we already know, is necessarily included in the development of our knowledge, and that what we do not yet know,

* Compare Chapter III., Section 7, page 136.

must be reached by observation and experiment, the conclusions from which are not necessary, or included in the facts observed, but are properly called Inferences.

23. In developing our knowledge, we are often said to take our arguments from *Comparison*. Now, all knowledge consists in being aware of relations; and to take an argument from comparison is therefore to take it from the store of all arguments. But a subject already known, may be better understood by seeking and using comparisons that are not a part of our knowledge at the moment of seeking them. Thus, we can feel or understand more vividly, the previously known fact, that novels of a certain kind are injurious, by comparing them to poison. The things known are not of the same nature, and the effects are in the one case moral, in the other physical: still there is the relation of similitude which renders the knowledge of the mischief done by novels more vivid. This topic, namely, SIMILITUDE, is the source of all metaphor in language: as may be exemplified by the previous instance, which appears no more than an ordinary metaphor when we say "Some novels poison the mind;" although, if expressed at full, there would be the same things which every act of knowledge includes, namely, the thing known; the thing by which it is known, or better known; and the knowledge itself. Thus, again, if we wish to understand more clearly the already acknowledged truth, that "The indolent cannot obtain the favour of heaven," we may compare indolent people with idle servants, and Heaven with the master: this, as the things compared are deemed to be of the same kind or nature, cannot so well be called an argument from Similitude, but is more appropriately described as an argument from ANALOGY or PARITY OF CASE. Further, in reasoning from the comparison of things agreeing in kind, we may take those that are known to be directly opposite in their qualities and effects. Thus in order to increase the vividness of our conviction that "Vice is the source of disquiet, that it leads to infamy here, and punishment hereafter,"—we may place these truths, already admitted, by the side of the opposite truths, and say that "As Virtue promotes peace, attracts honour and reputation, and paves a road to eternal bliss," so Vice, &c., which is called an argument from CONTRARIES. Still further; it is possible, in comparing things of the same kind, to take

neither those that have exactly parallel or analogous effects, nor those that have opposite effects, but things that have the same effects so far as they approach perfect identity. Thus if we desire to illustrate the admitted truth that "The wicked are always more or less miserable," we may place it by the side of another admitted truth, that "The entirely wicked are entirely miserable, and other wicked people less so, only in proportion as they are less wicked." And this may be called an argument from PROPORTION. And fifthly, there is a special way of arguing from comparison, when, in order to illustrate an admitted truth, we place it by the side of one of the same kind, which, though acknowledged as a truth, makes its way to the understanding with more difficulty. Thus to understand with greater force the truth that "A man ought to be forgiving to his *friends*," we may place it by the side of another truth, which is admitted, though less liable to be so, and say that "A man ought to forgive even his *enemies;* much more then ought he, &c." And this is called the argument A-FORTIORI, or from a *bolder* assertion in proof of one less bold, that is, less difficult of admission.

24. It is chiefly in these special ways of reasoning from comparison that the phrases CÆTERIS PARIBUS, and MUTATIS MUTANDIS occur. The meaning of the former is, *Other things being equal;* of the latter, *Those things being changed which the difference in the persons or things compared may require to be changed.* Thus we may have occasion to say, "This measure was successful then, and, *cæteris paribus*, will succeed now." "This course and method of study will benefit boys, and, *mutatis mutandis*, may be adopted for girls."

PRACTICAL DISTINCTIONS CONTINUED: ii. NAMES OF ARGUMENTS FROM THE DATA ON WHICH THEY REST.

25. In every act of the reasoning power there are three things: the thing known; that by which it is known; and the knowledge itself, abstracted from the things that suggested it. In the deductive process of logic, the former two things are likewise abstract knowledge; and we may call the one the *datum*, the other, the *argument*, or reason. It is sometimes quite immaterial to which we apply the one or the other of these two names: for instance, when we say, "Three feet are

one yard; thirty-six inches are three feet; therefore thirty-six inches are one yard:" here we may indifferently call the first or the second proposition the *datum* or the *argument;* out of which the third proposition arises as the *conclusion*. The two former propositions are called the *premises*. For the most part, however, the premises out of which a conclusion arises, will, in the deductive process, consist, first of a general proposition which includes many particulars; and secondly of one of those included particulars: the term *datum* will then be properly applied to the general proposition; and the term *argument* to the one included in it: and the argument may, under such circumstances, take its name from the nature of the knowledge which is presupposed or assumed in putting it forth as an argument. It is to be observed, that the doctrine here held seems to belong only to the process of reasoning with other minds, and therefore to Rhetoric, and not to Logic. Yet, even in thinking within oneself, a person may proceed from knowledge more or less deeply founded; and the distinctions laid down under the head which is placed above, are, on this account, claimed for Logic, although they will be properly repeated when we have to consider the practice of Rhetoric.

26. When we develop our knowledge by an argument which is included in such general knowledge as all mankind possess, the argument is said to be ARGUMENTUM AD JUDICIUM, that is, an argument to [ordinary] judgement,—an argument which all people of common sense and ordinary information must admit, as well as oneself. And this is the ground of almost every argument; to which every particular ground—every one, for instance, which is described and exemplified in the six following sections (27, 28, 29, 30, 31, 32), is an exception.

27. When a person develops knowledge in which others have no share, the arguments are fitted to convince himself alone. For instance, if I know, and no one else knows, that "John lived with his uncle," the fact which may be known to many people that "John's uncle always lived in London," is an argument with me that "John lived in London;" but can be no argument with those who have no share with me in the knowledge implied by the first proposition. An argument thus peculiarly founded, is the type of that kind, which

in Rhetoric is called ARGUMENTUM AD HOMINEM, that is, an argument addressed to the knowledge, the principles, or persuasion, entertained by the one man in particular whom they are intended to convince; the difference being *that* which holds universally between Logic and Rhetoric, namely that, in the former, the reasoning is confined to oneself, and the peculiar knowledge is one's own; while, in the latter, the reasoning is applied to convince another, and the peculiar knowledge or persuasion belongs to that other person.

28. When the knowledge we develop is a particular department of learning or science, the arguments are fitted to convince all who are instructed in that part of learning or science, but not to convince people of common or ordinary information. Thus if I know the distance between myself and a certain column to be two hundred feet, and that the angle formed by the lines reaching from my feet to the base and to the top of the column is an angle of forty-five degrees, I shall conclude that the column is two hundred feet high: but this will be a conclusion only to my mind, and to others instructed in the science on which the reasoning proceeds. An argument thus founded is called ARGUMENTUM AD DOCTRINAM, that is, an argument addressed to or derived from some particular part of learning.

29. When we develop knowledge which rests for its truth on the reverence entertained for its source, each included argument takes the name, ARGUMENTUM AD VERECUNDIAM, that is, an argument derived from, or addressed to, the sentiment of reverence or respect. Thus, for instance, if I believe all to be true which a certain respected friend solemnly avers, I shall believe every particular to be true which makes a part of the whole; and the conclusion will be, that since the whole is true, the particular is true.

30. When we develop knowledge which rests for its truth on the religious faith we embrace, each included argument takes the name ARGUMENTUM AD FIDEM, that is, an argument derived from, or addressed to, the religious faith of the person or persons embracing such faith. Thus, with regard to persons who admit the Bible to be the inspired word of God, every particular included in the Bible is admitted to be a part of that revelation, and consequently admitted to be true.

31. In Rhetoric, it is possible to address inferior motives of action, and to keep back, in order to gain some temporary end, the truth as it exists in the mind of the artful reasoner. In Logic, it is not possible so to deceive oneself; but there are ways, nevertheless, by which, even in one's own thoughts, one may wilfully go astray. A person may choose, for instance, to remain in a state of ignorance on a certain subject, when the ways to inform himself are open. Whatever conclusion he may reach while in this state, will be a conclusion derived from ignorance, and the process,—with such difference as the difference between Logic and Rhetoric creates,—will correspond to what, in the latter, is called, ARGUMENTUM AD IGNORANTIAM. Such, for example, will be the process with a thinker, who, having imbibed the opinion that all people that belong to a sect in religion different from his own, are bad people, concludes that A. B., one of these people, is a bad man; which may or may not be true in point of fact, but is not made true by an argument thus derived.

32. Again, it is not only possible, but is the great error of our lives, to be led away from truth in our own thoughts by the allurement or the violence of our passions. In every case of this kind, there are two sets of *data*, the one set abstract, or free from our passions, the other set derived from, or suggested by them. Thus, for instance, the murderer knows that the act he is about to commit, is a crime, but there is some good suggested by his passions, which, in the blindness they create at the moment, seems to outweigh the good he leaves behind; and the conclusion which he reaches, urges him to the deed. Such a case corresponds to the process which, in Rhetoric, is called ARGUMENTUM AD PASSIONES.

PRACTICAL DISTINCTIONS CONTINUED: iii. NAMES OF ARGUMENTS FROM THE FORM IN WHICH THE REASONING IS EXPRESSED.

33. The forms of language are changeable at pleasure, while the reasoning process which gives occasion to the particular form that includes the result, remains, or may remain, precisely the same. Every single word is the fit expression of intellectual acts, not perhaps ascertainable as to all the steps after the knowledge indicated by it has been attained;

but however many those steps may have been, each step in the progress to the result which the word expresses, comprehended three things,—the thing known, the thing by which it was known, and the knowledge itself abstracted from both. Thus the word *man* cannot express the knowledge we have under that word, unless there is first apprehended a creature distinct from other creatures, as, for instance, a creature like oneself, yet not oneself, and in most respects unlike other creatures. Such, or something like it, is the knowledge we include under the name; which knowledge involves the three things stated, the thing known, the thing or things by which it is known, and the knowledge itself. When, afterwards, our knowledge under the same word becomes mature through the force of instruction or of observation, and we understand man as a rational animal, there are still the three things already referred to; for we understand him to be rational because we understand other animals to be irrational, and our knowledge, included under, and abstracted by the word, is the result. We may, if we like, develop the knowledge which this word thus includes, in such a form as the following: "Every creature on earth that is not irrational is man; the creature now under notice or knowledge, is not irrational: therefore the creature now under notice is *man*." These three propositions, the moment they are recognised in their connection with each other, are one expression with one meaning; and the word *man* includes the whole of that meaning; but the word *man* is, in form, a grammatical noun-substantive: the three propositions are, in form, what, in logic, is called a syllogism. Now in this way may every result of the understanding, if not already expressed in the form of a syllogism, be expanded or reduced into that form; and this form, since it represents the three things included in every act of the intellect, is commonly assumed to be the fundamental form, to which every other form is referrible, when we desire to examine its soundness.

34. But the syllogism is a fundamental form, only because it represents, in three distinct propositions, every natural act of the understanding. It has no other merit. Its claim to be demonstrative, that is, to exhibit a *necessary* conclusion, rests on the fact, that the first two propositions, which are called the *Premises*, contain the conclusion. If the premises

are denied, we must go back to another syllogism, and perhaps to another; and if we thus fairly go back to the beginning of our knowledge, that beginning will always be an *induction*, that is, knowledge growing out of two things which do not include the knowledge, but spring from the natural capacity of the intellect, operated upon by the things of sense. A phrase constructed of two words, may represent the syllogism as thus described,—namely the syllogism whose premises contain the conclusion as well as the syllogism whose premises infer it. For example, the phrase, *Reasoning man*, exhibits premises containing the conclusion which the phrase expresses; for he who knows what the word *reasoning* means, must know that it includes *man;* again he who knows what the word *man* means, must know that it includes the power of reasoning which is essential in man. The whole phrase, then, which is one expression with one meaning, exhibits a necessary conclusion out of the premises indicated by the words which form the phrase. This is an example of a phrase representing the syllogism whose premises contain the conclusion. Let us take another example; *Mortal Man.* He whose experience goes so far as to assure him that man is *mortal* universally, that is, including men that live, and men that will live, will find this phrase correspondent with the other: but if the premises should be doubted,—that is, if it should be doubted whether the knowledge we have under the term *mortal* can be applied thus universally to *man;* or whether the word *man* includes thus universally of *man* what we mean by *mortal*, then we have to await further facts in order to confirm or set aside what the phrase expresses. Suppose the facts at length suggest the result, such result will be an *inference*, not a necessary conclusion; till at length the previous knowledge being granted, the conclusion is necessarily granted with it. Now every syllogism drawn out in form, if we deny or question its premises, will lead us thus back to the same state of things, namely, a state in which the conclusion will not be a necessary consequence, but an inference. Hence, then, as there is no *virtual* difference between a syllogism, and any expression constructed of two words that make sense, we may take the latter, namely two words that make sense, as the original, because the simpler form of expression, which Logic employs in the deductive process, and refer all other

forms, including the syllogism itself, to that simpler form of expression. Two words that make sense may not, however, form a sentence or proposition: they may form only a part of a sentence, that is a part of speech. This indeed is of no moment to Logic, if we look only to Logic independently of Grammar. But logic though distinct in theory from grammar, is, in practice, indissolubly connected with it; and hence a complete expression of logical deduction must be at least a sentence. Now the shortest sentence that can be constructed, is that which consists of nominative and verb; and this, as being the shortest and simplest form of expression, may be regarded as the original form in which knowledge is developed in deductive Logic; as, "Man reasons;" "Man dies;" "John lives;" "Fairies frolic."

35. But the noun and the verb, which are the only essential parts in the logical development of knowledge, may each be a constructed part, that is, may be a part indicative of further logical development. Instead of saying "reasons," (see above,) we may say, "is a reasoning creature;" and the whole proposition will then be, "Man is a reasoning creature." The other propositions may be developed in a similar manner. Whether developed in this way or not, the process of the understanding will be the same: the result must always be expressed by instrumental signs, which being joined, form one expression with one meaning. Thus, for instance, the following sentence, when all its parts are put together, is one expression for one meaning, "Man, noble in reason, infinite in faculties, in form and moving express and admirable, in action like an angel, in apprehension like a god, —is a wonderful piece of work." The development of its one meaning is, primarily, into two parts, which two parts may be called nominative and verb. These two parts are subordinately divisible, till we reach the grammatical single parts of speech which form the larger grammatical parts. In Rhetoric, it might be advisable to reach the result by several distinct sentences; and each sentence, in Rhetoric, might advisedly take the form of exclamation: * but these expe-

* For instance, as it stands in Shakspeare, "What a piece of work is man! How noble in reason! How infinite in faculties! In form and moving, how express and admirable! In action, how like an angel! In apprehension, how like a god!"

dients are forms for influencing other minds, not forms which the thinking mind requires for the development of knowledge in order to satisfy itself. This doctrine being admitted, we conclude that the sentence consisting of nominative and verb, however these two parts are subordinately divisible, is the original or primary form in the logical development of knowledge.

36. Still, as the custom of Logic, from time immemorial, has been, to refer all forms of speech to that of the SYLLOGISM; and as this agrees essentially with the doctrine unfolded in the previous remarks; there is no necessity to oppose such reference. The following names and distinctions, which assume the syllogism for their foundation, may therefore be acquiesced in: *

37. An EN'THY-MEME is a form of language which includes the three propositions of a syllogism, while it expresses only two of them. Thus, if we say, "Brutes are not rational agents, and therefore are not accountable," we imply, but do not express the datum, "None but rational agents are accountable." Again, when we say "John lived in London; for he lived with his uncle;" the reason given in the second proposition for what is stated in the first, includes the datum that his uncle lived in London; since without that datum, it would be no reason at all.

38. A SORI'-TES is a form of language which includes two or more syllogisms, while it so expresses the reasoning, that each proposition is the ground of the following one, till we reach that in which we design to rest: in other words, it is the *accumulation* of one argument upon another; as, "Man is a creature endowed with reason and liberty; every creature so endowed is accountable for his actions; an accountable creature will be punished for his evil, and rewarded for his good deeds; therefore man will be punished or rewarded."

39. A Logic which builds its principles on the arbitrary

* The reader has to be admonished, that in all these remarks, we are contending against the formal logic of Aristotle, of which the pervading characteristic, is, to attribute to the changing forms of language essential differences of mental act. Against such doctrine, a more explicit opposition is offered in the sixth chapter of this work; to which chapter the reader is referred for a better understanding of the purpose of the several remarks now in progress.

forms of language, so that the parts of speech, whether simple or compounded, are made to act differently and distinctly in the process of coming to a conclusion from premises, is an art quite apart from the Logic treated of in these pages. The former is the art of reasoning *with* words, so as to keep the things signified as much as possible absent from the understanding: the latter is the art of reasoning by *means* of words so used as to keep the things signified ever present to the understanding, in order that our conclusions may be, not from the words, but from the things they signify. Now with regard to this logic, which is the logic existing in the common daily use of language, the grammatical character of a word, or the peculiar form of a phrase or sentence, is unessential to the validity of its acts. It is, for instance, of no moment in our logic, whether we say, *Man*, or *Reasoning man*, or *Man reasons*, or *Man is a reasoning creature*, the thing meant being in each the same, and the whole of the words in the last example forming one expression for the one meaning expressed by the first. True it is that we are called upon, by the form of the first, and of the second expression, to esteem the expression only an instrument of meaning to be developed, and not as meaning yet developed; while, with regard to the last two examples, we are at liberty either to rest in the development so far made, or expect it to proceed further; and in this way Logic accepts the ministry of Grammar: but the differences are unessential in logic, and belong, properly, to the other department of learning. In our logic, again, it is of no moment whether we say, *Every man is liable to error*, or, *No man is free from the liability to error*, since each proposition, as one expression for one meaning, stands for the same meaning; and since each resolves, primarily, into two parts, namely the former proposition into *Every man*, and, *Is liable to error;* the latter, into, *No man*, and, *Is free from the liability to error*, out of which two parts, in the respective instances, the same one meaning springs. When therefore, the former is called an affirmative, and the latter a negative proposition, we leave the distinction to grammar, and consider that logic is in no way concerned with it, though in Rhetoric there will generally be a ground of preference for the one or the other. In our logic, once more, it is of no moment whether we say, *Kings, like other*

men, are mortal, or *If kings are men, they are mortal;* whether we say, *If the world is a sphere, we must be able to reach the same point, by moving from it in any one direction;* or *The world being a sphere, we must be able*, &c. We may admit the one form in each of these instances to be called a *categorical* proposition, and the other a *hypothetical* or *conditional* one: we may also admit, on rhetorical grounds, sometimes the one, sometimes the other, to be preferable: but we do not admit that Logic, in its own strict province, has any concern with such differences, either in propositions, or in the syllogisms which may be developed from them.

40. There is, however, one description of syllogism, whose difference from others our logic acknowledges, because it is not a mere difference in form of expression, but a peculiarity in the character of the knowledge developed. The syllogism referred to, is called the DILEM'MA; a form of expression never justly possible but when the knowledge to be developed includes something true and something not true, while it does not include which is which: for instance, the knowledge or datum, that *The blessed in heaven will be fully content, either because they will have no desires, or because their desires will be completely gratified*: the knowledge or datum, that *Æschines joined in the public rejoicings, in which case he is inconsistent; or did not join in them, in which case he is unpatriotic*: the knowledge or datum, that *A certain man spoke irreverently of scripture in jest, in which case he is not wise; or in earnest, in which case he is not good.* These, unfolded into syllogisms, will be examples of the Dilemma; as,

"If the blessed in heaven have no desires, they will be fully content; so they will if their desires are completely gratified; But either they will have no desires, or have them completely gratified: Therefore they will be fully content."

"If Æschines joined in the public rejoicings, he is inconsistent; if he did not, he is unpatriotic; But he either joined or not: Therefore he is either inconsistent or unpatriotic."

"If this man were wise, he would not speak irreverently of scripture in jest; and if he were good, he would not do so in earnest: But he does it either in jest, or in earnest: Therefore he is either not wise, or not good."

The manner of reasoning called *Reductio ad absurdum*, (bringing to an absurdity,) may be mentioned with the

dilemma, as requiring, like it, a double supposition; the difference being that it completely establishes one of them; as, "This road to our house is either straight or crooked. I affirm it to be straight, but I have no direct proof: say, then, that it is crooked. But it is of the same length, and extends between an equal distance, with one which we know to be straight. Thus we have two lines of the same length, and extending between an equal distance, the one by admission straight, the other by supposition crooked; which supposition is absurd. Therefore the line or road in question is not crooked; that is, it is straight.

41. An EPICHIRE'MA is a syllogism with arguments or proofs appended to one or both of the premises. Let the following syllogism be the foundation of an epichirema:

Datum.—"An event that has always followed an act, will continue to follow it when circumstances are the same.

Argument.—"Death has always quickly followed the drinking of this juice.

Conclusion.—"Therefore, the circumstances continuing the same, death will, in this instance, quickly follow the act of having drunk of this juice."

The following further development will give to this syllogism the name Epichirema:

Datum.—"An event that has always followed an act, will continue to follow it when circumstances are the same. This is not a necessary truth, but the persuasion of habitual experience, and we acknowledge its certainty by calculating, without hesitation or doubt, on issues that have often been tried.

Argument.—"Now the drinking of this juice has always been quickly followed by death; as I can affirm from instances that have come under my own observation; from many more that have been reported to me by friends; and from innumerable others which past recorded experience bears witness to.

Conclusion.—"Therefore, unless something can instantly be done to change the circumstances in the present case, death will quickly follow the act that has been committed."

In this laborious way does Logic, if left entirely to its own mode, develop knowledge—Logic which is without passion, —without impulse to action. Rhetoric would be much more brief notwithstanding her repetitions,—"He'll die! he'll die! he has drunk poison! Oh! for an antidote!" Virtually, we here have the whole of the previous argument, with emotion, and urgency to action, superadded.

Practical Directions continued: Exercises suggested for Improvement in Logic.

42. There can be no proper practice of Logic which is different in principle from that which directs the ordinary use of language. In the previous pages we have been employed in ascertaining what that principle is; and now that we know it, we have to act upon it as before, but with the caution which theoretical knowledge confers. It is true that the ordinary use of language aims at rhetorical effect as well as logical precision; in other words it is meant to influence others, as well as to develop the knowledge in the reasoner's mind. But in practice it is not wise, nor would it be easy, to separate Logic from Rhetoric by any very rigid line: for Logic is the proper ground of Rhetoric, and the practice of Rhetoric includes or ought to include Logic. In following such exercises as are hereafter suggested, the learner is therefore only cautioned against any style which dispenses with a patient and laborious employment of thought; but provided he fulfils his duty in the clear development of his own knowledge, he needs not be the less satisfied, if his language has a correspondent effect upon other understandings.*

43. Improvement in Logic is best promoted by the writing of what are called Themes. The word *theme* properly means the subject of a discourse; but the discourse itself, if merely an exercise, is also called a theme. We begin with a title, which title may be a single grammatical noun, or a logical noun, or a proposition.†

44. The title or subject of a theme being a mere grammatical noun, will be the name of a thing *real*, or *ideal*, or *metaphysical*; ‡ while the name itself will be *proper*, *common*,

* Compare Section 1 of the present Chapter, p. 140.

† Compare Section 7 of the present Chapter, p. 145.

‡ Compare Sections 18, 19, 20, Chapter II. pages 117, 118.

or *abstract*. Thus *Solomon*, *Socrates*, *Alexander*, *King Alfred*, *Homer*, *Virgil*, *Shakspeare*, *Milton*, *Aristotle*, *Bacon*; *London*, *Rome*, *Paris*; *Thames*, *the Rhine*; *Vesuvius*, *the Alps*; are proper names of real persons and things: *Ceres*, *Bacchus*, *Queen Mab*, *Lilliput*, *Brobdignad*; are proper names of ideal persons or things: *Animals*, *Vegetables*, *Minerals*; *Man*, *Beast*, *Bird*, *Fish*, *Insect*; *Tree*, *Shrub*, *Herb*; *Earth*, *Stone*, *Metal*; * *Fire*, *Air*, *Earth*, *Water*; are common names of real things: *Fairies*, *Ghosts*, *Fauns*, *Nymphs*; are common names of ideal things: *Virtues*, *Vices*, *Qualities*, *Attributes*; are common names of things metaphysical. *Faith*, *Hope*, *Charity*; *Prudence*, *Justice*, *Temperance*, *Fortitude*; are names abstract of things metaphysical. And any one of these becomes the title of a theme by putting the word *On* before it.

45. Among the previous classes of names or subjects, that of most frequent choice or occurrence will be the last,—a thing metaphysical under a name abstract: of which the following are given as further instances, with hints subjoined to assist the learner in developing his knowledge.

On Conversation. *On Writing*. *On Reading*. *On Travelling*. *On History*. *On Building* or *Architecture*. *On Sculpture*. *On Painting*. *On Music*. *On Poetry*.

These are things exercised, or done, or known, and imply persons who exercise or know them. Hence they are things metaphysical, and the cautionary principles † must be kept in mind. The generic name will be, an ability or practice, an art, a science: an art may be further developed by the distinction mechanic; or fine,—(ornamental;) and the specific nature or more particular description will complete the first point. Then may come some one, or more, or all of the following points: the improvement or the use derived or derivable: the pleasure derived or derivable; the abuse or omission, and consequent disadvantage or mischief. In some instances, the progress of the art or science from early times to the present may be glanced at. Such are the points which may be taken in treating the foregoing subjects.

* Ordinary and not scientific knowledge, is aimed at in suggesting these titles.

† In Chapter II. Sections 15, 16 at pages 114, 115; and Sections 20, 21 at page 118.

These being left for the learner to develop,—one, or more, or all,—another subject of the same class is added, with a development appended by way of example.

"*On Observation.*

Observation is the practice of using the natural powers of sense and understanding, so as to reach and retain all the knowledge we can. With regard to this practice, there are great differences among us. Some, with powers naturally good, and with extensive opportunities of gaining the wisdom that grows with experience, seem to pass through life with their senses and understanding closed, and leave the world almost as ignorant as they entered it. They hear wise converse, and read wise books, but derive no practical advantage from either. They see others fall into difficulties and dangers, of which the causes and consequences are easily traceable; but they neglect to trace them, and learn nothing by which they may avoid the same mischiefs. They travel through countries, and see new manners and customs; but they make no comparisons, nor draw any useful conclusions. In short, their minds resemble a stagnant pool of water, which, if it collects anything, covers itself only with weeds. In the meantime, there are others, whose sphere of remark is very limited, but who appear nevertheless to gain experience at every step, and to grow in wisdom as they grow in years.

The difference which has been alluded to, arises from nothing but the imperfect exertion of the natural powers in the one case, and their proper and active use in the other. A habit of inattention, or a habit of quick-sighted observation, appears to be gained or lost, much in the same way as habits of bodily indolence or activity are gained or lost. It is the determination of the will, or the want of it, that in either case, produces the good habit, or allows the evil one to form itself. Let us determine to keep the senses and the understanding closely applied at proper times to their appropriate objects; and, with perseverance, the good habit will be gained, and the evil one avoided."

The following are other instances of subjects that are things metaphysical under names abstract:

On Curiosity. On Hope. On Fear. On Anger. On Pride. On Humility. On Envy. On Emulation. On Piety. On Patriotism. On Generosity. On Selfishness. On Avarice. On Prodigality.

The generic name of these will be, a principle in human nature, or an impulse, or a feeling, or a sentiment, or a passion. The particular description from the effects produced will be the difference. The definition thus made out, the next point may be, the benefit or the evil. In some of the subjects there will be both a benefit and an evil, depending upon the proper and ill regulation of the principle, the sentiment, or passion. Instances from history, or from experience may be added to verify the previous conclusions. It must be observed, further, that some of the subjects, as *Hope* and *Fear*, *Pride* and *Humility*, are so obviously opposed in nature, that the one cannot be considered without reference to the other. Of others, though not opposed, it must nevertheless be observed, that the one cannot be accurately distinguished without some allusion to the other; for instance, *Envy* and *Emulation*, which are passions that spring from the same root, namely, a desire of superiority, but differ by growing the one in a base, narrow, selfish mind, —the other in a generous one. *Courage* and *Fortitude* are subjects that require also to be distinguished, not on the same, but on peculiar grounds. As an example to guide the learner, the latter of these subjects is developed under certain points hereunder:

"*On Fortitude.*

Fortitude and Courage are not synonymous words, though each quality in some degree implies the other. Fortitude is passive, Courage is active. Fortitude is strength to endure pain, or other calamity; Courage is the absence of dismay in meeting and contending with that which threatens pain or death. Yet a courageous man can scarcely maintain his title, if he has no fortitude: a woman of fortitude can scarcely be so deemed, if she has no courage.

We may distinguish these virtues by other marks.

Courage is much more frequently a constitutional quality, than one derived from thought and moral principle: the other may also be constitutional, but it is much more frequently derived from the latter source, or at least improved by aid from it. Men are more courageous than women, because with them the bodily frame is stronger. Women are often found to have more fortitude than men, partly from a difference of constitution, but frequently because religious or moral feelings are purer and stronger in them than in the other sex.

But equally in woman and in man, Fortitude is a quality indispensable to the perfection of the human character. We are born to pain, or to calamity that produces or threatens pain. Without strength to endure, the pain or calamity is more than doubled, and a person who has no portion of such strength, is not only more miserable than they who have it, but is less respected and esteemed.

The question however remains, whether Fortitude depends upon discipline, or is altogether a gift of nature. We may safely answer that the best source of Fortitude is religious and moral instruction. It will aid natural strength where nature is already strong: it will supply it where nature is weak. He who, in affliction, feels that the hand which afflicts means the transient evil for future good, will be able to bear the weight of that hand without repining. Like the virtuous Job of old, he will rise above his trials, and, like him, will find, sooner or later, a reward for his endurance."

46. We have seen * that the arguments or *means* used in developing knowledge, are internal or external; in other terms, subjective or objective. When the name or title of a theme is immediately applicable to an external thing, that is to a real, or an ideal thing, and not immediately to a thing metaphysical bearing an abstract name, the difficulty of de-

* Section 12 of the present Chapter, page 148.

velopment is increased, because the thing presents itself under a double aspect,—namely in its individual, outward, *objective* shape, and as a *subject* that may be traced from the stores which the mind has already appropriated; stores which may be said to be already a part of the mind itself. Let us say, for instance, that *Socrates*, the proper name of an individual person, is proposed as a theme: to treat this objectively would be, to detail the facts belonging to the individual,—the place and time of his birth, who were his parents, what were the acts and events of his life, what the time and manner of his death. But we may omit these facts or take them for granted as known to all persons of education, and confine our development to thoughts generated by these facts, so that in truth the theme would more properly be entitled, *An Estimate of the Character of Socrates*, or *Thoughts on the Character*, &c. Thus named, and thus pursued, the theme would class with those already exemplified, namely a metaphysical subject under a name abstract; for the several words form one name with one meaning; and that name taken as one, is a name abstract. We are at liberty, however, to develop our knowledge in both ways; and all that, in such case, we have to remember, is, to keep the points clear and distinct both in thought and in expression, and not to let the single name *Socrates* be a hindrance to the fixing of proper points for consideration.—Let us take, for another instance, the common name *Man*, as including knowledge proposed to be developed by a theme:—how shall we proceed? We are distracted at first by the apparently interminable considerations that spring indistinctly, like blending rays, from this centre. To consider man objectively requires the thinker to be an anatomist, a physiologist, a tracer of the race in every variety which climate or original constitution has generated; which is to expect more than can be fulfilled by any one person. For an ordinary theme, if some objective points are taken, they must be such as present themselves to every observer; as for instance the human shape compared with that of other animals; and the superior intelligence by which the strongest and most cunning of those animals are subdued. But under the name *Man*, it is not uncommon to find that the knowledge developed is merely subjective; which happens when *man* is

considered not in his physical, but only in his moral relations.* The title in this case would strictly be, *On the Moral Relations of Man;* and thus named, the theme would class with those already exemplified.—Let us take, for a third instance, the plural word *Ghosts*, a name of certain things ideal: an objective development of knowledge under this title, would be a description of the times, the places, and the appearances of ghosts, either according to special reports, or founded upon opinions that are, or have been prevalent. But, retaining the title, all objective reference to ghosts might be omitted, and the theme pursued subjectively, as if the title had been, *On the Belief in Ghosts:* when it would appear to be a theme classing with those already exemplified.

47. It further appears from what precedes, that the title of a theme may be a grammatical noun-substantive, as *On Ghosts*, *On Knowledge*,—or a logical, that is a constructed noun-substantive, as *On the Belief in Ghosts*, *On the Knowledge of the World.* But a proposition, a moral saying, or a proverb, may be placed as the title of an exercise; as, *A proper Knowledge of the World is favourable to Virtue: Trust not Appearances: Honesty is the best Policy.* A theme thus given out is commonly called a *Thesis.* There is, however, no essential or necessary difference between a thesis and a theme,† except the form of title; for without requiring any change of what may have been developed under one form, the title may at pleasure take the other form; as *On the moral Advantages of a proper Knowledge of the World: On the Danger of trusting to Appearances: On the Policy of being Honest.* The following exercise, for instance, which is called a thesis, would be a theme, by such change of title as is suggested above.

"*Trust not Appearances.*

It is highly imprudent to be guided in our opinions and conduct by first appearances. For the worst of

* Pope's poetical Essay on Man is an instance.

† The terms, moreover, are etymologically the same. Some teachers make a difference between both of these, and an Essay. Such distinctions, being, as they are, distinctions without a difference, are made either in ignorance, or for the sake of practical differences which would be better indicated in some other way.

persons and of things wear at times the most engaging aspect: the wily thief approaches in the garb of scrupulous honesty: the corrupter of hearts carries on his brow nothing but benevolence and candour: vices of every kind assume the guise of virtues: and pleasures that end in misery promise, at first, nothing but delight. In things of less importance, deception and fraud are equally common. The unjust trader gives a false appearance to his wares; and mere empirics in art or science make larger promises than they who are really skilful.

This description of what we meet with in the world is supported by further proofs. It is because the arts of deception are spread in every direction, that parents are careful to impress on their inexperienced children the necessity of caution. It is on this account that all reflecting people consider the heedless, the giddy, the easily-confiding, to be in constant danger. It is for this that, as we grow in years, we alter many, if not most of our judgements, and become more suspicious even when, by an increase of our experience, we are less in danger of being deceived.

The world may be called a garden abounding with noxious fruit, among which much may be found that is wholesome: but unfortunately the far greater part of the former is more enticing to the eye, and, on first taste, far sweeter than the latter. If the simile has any truth in it, we are warned never to pluck and eat without the utmost caution.

Poets as well as moralists bid us beware how we trust to the world. Shakspeare calls it

> ——— the guiled shore
> To a most dangerous sea, the beauteous scarf
> Veiling an *Indian* beauty; in a word,
> The seeming truth which cunning times put on
> To entrap the wisest.

As to History, it is full of practical warnings on the subject before us. Let us take one as an example of the rest. When the Greeks, after a ten years' siege, found themselves unable to take Troy by force, they feigned an abandonment, and left behind

them a large wooden horse filled with armed men. This being dragged into the city by the credulous Trojans, the men left their concealment in the night, opened the city gates, and gave admission to the besiegers. Thus fell Troy: and thus are all persons liable to be lured to their destruction, who will not mistrust appearances when there is danger of being deceived.

Let us, then, in passing through life, never be too secure or confiding,—but when new doctrines are offered to our notice; or new inventions that throw the old into the shade; or new acquaintances whose manners are more engaging than those of tried friends, —let us suspend our judgement, and not be carried away by first impressions: let us wait till time and experience furnish some sure grounds for the opinion we are inclined to form, or the conduct we are disposed to pursue."

The points signified by the several divisions or *paragraphs* of this example, are named, by some teachers, the PROPOSITION and REASON; the CONFIRMATION, or additional reasons; the SIMILE; the QUOTATION or testimony; the EXAMPLE; the CONCLUSION.* Such divisions may, or may not occur in the development of knowledge under any other title.

The following are other theses on which exercises may be written: *Home is home.—A rolling stone gathers no moss.—A burnt child dreads the fire.—Charity begins at home.—There's many a slip 'twixt cup and lip.—Necessity is the mother of invention.—Harm watch, harm catch.—Let the shoemaker keep to his last.—Ignorance is full of wonder.—Nothing venture, nothing have.—Well begun is half done.—Enough is as good as a feast.—'Tis an ill wind that blows nobody good.—Tread on a worm, and it will turn.—Penny wise and pound foolish.—Take care of the pence, and the pounds will take care of themselves.—Good words cost nothing.—Better lose a jest than a friend.—Pardon others, but not thyself.—He lives long enough who hath lived well.—The worst of crosses, is, never to have had any.—Fools rush in where angels dare not tread.*

* The several topics (see Sections 12–24) whence the arguments are derived for the parts of this exercise, are, for the Reason, *experiment;* for the Confirmation, *effects;* for the Simile, *comparison;* for the Quotation, *testimony;* for the Conclusion, *adjuncts.*

CHAPTER V.

ERRORS TO WHICH LEARNERS ARE LIABLE IN ATTEMPTS TO DEVELOP KNOWLEDGE.*

1. Experience in aiding pupils to develop their knowledge, will soon make manifest that, according to the disposition of each, and the qualities of his understanding, he will infringe the laws of logical deduction in one or the other of the following ways:

1. By VERBIAGE;
2. By CONFUSED REASONING.
3. By DISJOINTED REASONING;

VERBIAGE.

2. Verbiage is an *art* which stands by itself: it is the art of joining well-sounding words into correct forms of sentences, with little or no regard to any resulting sense; the art of using language grammatically, but not logically; the art of *appearing* to reason, and employing words for this end, but of employing them in the absence of the knowledge which they ought to include. We here call it an *art*: it is an *art* in the bad sense of the term.

† A pupil who has read, but has not thought a great deal, will have his memory stored with book phraseology, but will be deficient in such knowledge as may be justly called his *own*. He can supply this deficiency, only by a determination carried into practice, of reasoning from *things;* and, consequently, of going back to the inductive process, whenever his knowledge of things shall fail him. But if, instead of taking this course, he seeks only to make a parade of knowledge, by joining terms and phrases familiar to his memory which look well to the eye, and perhaps sound well to the ear, his beginning exercise will, in kind and character, resemble the following example:

---

* Much of what follows, and portions of what precedes, I have already published in a little work called "Practical Logic, or Hints to Theme-Writers," which first appeared in 1823. I state the fact, lest it should be thought I have borrowed from certain compilers of grammar what they have borrowed, without acknowledgement, from me.

† The pupil pursuing the First Course indicated in the Appendix, will do well to read what immediately follows, but the question put to him will be sufficiently met by what precedes. Wherever a correspondent remark is needed hereafter, this note will be referred to.

"*On Education.*

The invaluable blessings of a refined education, are so multifarious in their extent, and so incalculable in their essence, that the understanding and the imagination are equally unable to comprehend the phenomena involved in the boundless subject. Who, indeed, can justly appreciate the ineffable advantages which accrue to gifted individuals, ardent to exhume the germs of scientific lore, and attain the opulent results of disciplinary progress? Educational instruction exalts the faculties, animates the mind, improves the understanding, and, by throwing a divine light on the abstract operations of human intellect, gives a new grace to the whole character. Through the instrumentality of the influence which education alone can impart, we are lifted to another sphere. In short, education is the first of things, the master-key, the universal good; and we are bound at once to reverence its authority, and apply to its pure fountain for mental delight, and intellectual improvement."

Let it be supposed that this exercise has been written by a pupil, after a conversation with his teacher on the subject to be developed. Now, when a pupil makes proper use of a conversation so given in aid, the fact that all the immediate knowledge he develops has been supplied by the teacher, is no impeachment of the soundness or reality of the pupil's knowledge: for all our knowledge is acquired chiefly from what others communicate: how, and at what time, is of little moment, provided the instructed mind completely embraces and appropriates the knowledge. But there is this difference between two pupils so assisted by a teacher: the one forgets the phrases, and forms of speech, because his understanding has been intent on the things signified, and not on the words; and, therefore, in embodying the reasoning, his style will be his own, not an imitation of his teacher's: the other carries away little more than words and phrases, such as he has been accustomed to admire in reading, and these he puts together in the best way he can, so as to form an exercise more or less resembling the example just given. Such an exercise is not a beginner's essay in methodical *think-*

ing: it is an exercise in an *art* whose purpose is, to conceal the absence of distinct thought: and the teacher, to do his pupil justice, must run his pen through the whole essay, and require a new beginning upon what, to such a pupil, will be altogether a new principle. Not so with the other supposed pupil. Let the expression of thought be ever so poor and meagre, yet if his exercise contain clear evidence that the mind has been at work on the subject suggested, it ought to be accepted as a beginning of logical effort: improvement will come with practice, if the early deficiencies are pointed out and understood. The faults which such a learner is likely to commit, are described and exemplified under the two general heads that follow:

Confused Reasoning.

3. This fault, when it becomes evident in language, will be found to arise from the absence of proper distinctions and divisions.

* The following, which is an exercise by a very young logician on the same subject as the previous example, and may be supposed the result of the same previous suggestions, will serve to show the nature of the fault.

> "*On Education.*
>
> Education is certainly one of the most important things which belong to man, and the most useful and essential of any, if we reflect what a wild savage race we should be, if it were not for this inestimable blessing, and how very fortunate they ought to think themselves who have friends both able and willing to provide the means of it, without which we should not know the Author of our existence, to whom we are indebted for all our blessings and comforts, and we should not be able to provide for ourselves, for it is not the same with man as it is with birds, which instinct teaches to provide for themselves when they leave the nest of their parents, instead of which we are not only made agreeable in society, but if we

* See the second foot-note, page 180.

make a proper use of it, it is the source of all happiness, and therefore since we are sensible of its worth, let us who possess it think ourselves unspeakably happy, and never think it too much trouble to obtain, for surely it is the least we can do for such a valuable benefit."

This production, deficient as it is in all the other requisites of good composition, is not without some evidence of real thinking. Let this, then, serve as an example of the first formal attempt in the art which is treated of in these pages. The correction of the exercise, with a clear understanding, on the pupil's part, of the nature and purpose of the corrections, will complete and constitute his first practical lesson in logic. Let him observe, then, that he has run on, from the beginning to the end of his exercise, without a single division; and that he has used no stop but the comma, till he has reached his full stop at the end. Now, though it is true that grammar is one thing in theory, and logic another, and that the stops are regulated by grammar and not by logic; yet grammar and logic go together in practice, and there cannot be confusion in the former, that does not tend to obscurity in the latter. Let him, therefore, look with the eye of a grammarian on his work, and he will see that grammatical construction is often complete, where he has put only a comma. Complete construction always requires one of the higher stops,—strictly the periodic or full stop, but at least the colon or semi-colon. The logical connection is not broken by these marks of grammatical completeness, but, on the contrary, is made clearer. Construction may and must frequently pause, while the logical process continues, supposing this process to be of any length: and these constructional pauses must be indicated by the usual points. Further, let the learner observe, that his line of argument naturally diverges from two points, namely, 1. *The importance of education;* and, 2. *Our consequent duty as young students;* so that the whole theme separates into two subjected themes, that ought to be implied, though not formally named, by a division or break in the writing, exhibiting the whole theme in two *paragraphs*. Thus by logical subdivision and grammatical division, with a few minor corrections, the whole theme will take the following shape:

"*On Education.*

Education is the most important and essential concern of man. For let us reflect what a wild, savage creature he would be, without this inestimable blessing. He would not know the Author of his existence, to whom he is indebted for all his comforts. He would not be able to provide for himself. For it is not the same with man as it is with birds: they know, almost entirely by instinct, how to provide for themselves; but all knowledge necessary to man comes by education. It is education which lifts him from his helpless state, makes him an agreeable member of society, and prepares him for all happiness.

Since, then, education is so important, let us to whom it is offered think ourselves unspeakably happy, and never imagine we can employ too much pains to secure all its advantages. Let us reflect how very fortunate we are, in having friends both able and willing to provide the means of instruction; and let us show our gratitude by our willingness to learn; which is surely the least return we can make for benefits so valuable."

Disjointed Reasoning.

4. Disjointed Reasoning is the development of knowledge in parts not properly connected with each other. The propositions may be separately true, but the truth of the one does not lead to, or flow from that of the other.

* Warned by the confusedness which appeared in his first attempt, and aiming at the greater distinctness of the corrected copy, the learner will, perhaps, at the next attempt, produce an exercise formed of sentences after the following manner:

"*On Friendship.*

Friendship is a subject which has often employed the pen of the moralist. We all feel that friendship is necessary to our happiness. Many persons pretend to be influenced by friendship, who are incapable of

* See the second foot-note, page 180.

so noble a sentiment. Without a friend, the world," &c. &c.

Sentences of this kind do not form discourse:—they indeed all relate to the same subject or *theme* in one sense of the word, but they do not constitute a theme in the other sense:* they are so many distinct propositions, and ought indeed not to be written down in immediate succession, but with breaks in the manner of paragraphs, thus:

"Friendship is a subject that has often employed the pen of the moralist."

"We all feel that friendship is necessary to our happiness."

"Many persons pretend to be influenced by friendship, who are incapable of so noble a sentiment."

This is the way to write maxims or proverbs, but a theme must be managed very differently. We must not start from one proposition to another which has no immediate relation to it, but consider in what way our knowledge may be further and further developed in the direction which the initiatory proposition indicates, till nothing more in this direction seems necessary to be said. Suppose a proposition should appear destitute of a purpose which can be thus carried out, we must either reject it altogether, or, by some addition, give it a purpose with relation to what we choose shall follow it. The first of the foregoing propositions will exemplify what is here meant,—"Friendship is a subject that has often employed the pen of the moralist." It seems hardly worth while to make this observation for the sake of itself;—we expect something to follow which may define its purpose: for example:

"*Friendship is a subject that has so often employed the pen of the moralist*, that the few thoughts it may suggest to my mind, cannot be either novel or striking. Yet my remarks, though trite, may deserve some attention, because the subject itself is of the highest importance."

Thus carried out into a rational consequence, and a rejoinder to that consequence, the original proposition becomes a proper introductory paragraph. The next independent proposition may now be taken, and followed up thus:

---

* See Section 43, page 171.

"*We all feel that friendship is necessary to our happiness.* Individually weak, we stand in continual need of assistance, support, advice, and sympathy. But the coldness of the world, and even the indifference of our own hearts to all except a few by whom we are surrounded, soon teach us, that, without sincere friends, we may look for these good offices in vain. Therefore, we always flatter ourselves we possess friends, though there are many who pass through life unendeared to a single heart, and who are never served or assisted but through motives of interest or of fear."

This paragraph being completed, we may take the next independent proposition as the ground for a third:

"*Many persons pretend to be influenced by friendship, who are incapable of so noble a sentiment.* The selfish cannot feel it:—they will connect themselves with others to reap some immediate advantage, but they are ever strangers to that regard which frames to itself a happiness out of the happiness of others: all their views are of profit or of pleasure solely to themselves. Yet none are more ready than the selfish to give the colouring of friendship to all their actions; because they know this to be the most likely means of securing the return of greater benefits than they yield."

It is to be observed that not only should the sentences of the same paragraph be logically connected, but the paragraphs themselves should have a closer relation than merely that of treating of the same subject. Therefore, though the foregoing paragraph may not be liable to any objection in itself, yet when placed beside the other, it appears to be defective by not being consequent on what preceded it. This fault may be corrected, by drawing such a consequence from the second paragraph as may serve for the ground of the third: for example:

"As friendship is so important toward the happiness of life, we cannot be too careful in our choice of friends, lest we place a reliance on those who will desert and betray us in the hour of difficulty and distress. For it is but too true that many persons pretend to be influenced," &c.

A short practical conclusion carried on from the word "yield," in unison with the commencement thus prefixed to the paragraph, will give a finish to the whole theme: thus:

"Against such pretended friendship, let confiding generosity be ever on its guard."

5. Thus it appears that a theme ought to be free from verbiage,—that the parts ought to be properly arranged,—and that the thoughts should flow from, and support each other. Every fault which the learner is likely to incur, will be some special mode of violating one or the other of these three general rules.

Under VERBIAGE, the more special names may be, *Petitio principii*, a Latin phrase, implying *the demand* (for our proof) *of the very thing to be proved*: *Non-sequitur*, another Latin phrase, which means, that what is appended as a consequence, *does not follow* as a consequence: and *Error in distinction or division*, which amounts to no distinction or division at all. Again; Petitio-principii may so occur as to allow of still more special designations, namely, *Begging the question; Identical proposition; Explaining a thing by itself;* and *Reasoning in a circle.* So the fault of Non-sequitur may occur in such a manner as to be designated, *Irrelevant premises*, in which the inconsequence is obvious; and *Proving too little*, or *Proving too much*, in which the inconsequence is real, yet less obvious. So, again, Error in distinction or division, branches into *Distinction without a difference*, and *Confusion of cross divisions.*

Under CONFUSED REASONING, the special descriptions of fault may be, *Saying other than is meant; Not distinguishing different senses of the same word; Neglecting the means of distinction and division which grammar provides for the clear development of thought.*

Under DISJOINTED REASONING, the special descriptions may be, *Omitting necessary propositions; Proposing too much or too little; Deviation from the proposition; Discoursing short of the proposition; Discoursing wide of the proposition.* All these may have for their general title, as well *Disjointed Reasoning* as the Latin phrase *Ignora'tio elen'-chi*, which implies—forgetfulness, or omission, of the point to be made out or developed.

The following synopsis will render the previous explanation at once intelligible:

- VERBIAGE,
  - *Petitio principii*,
    - Begging the question.
    - Identical proposition.
    - Explaining a thing by itself.
    - Reasoning in a circle.
  - *Non sequitur*,
    - Irrelevant premises (void of consequence)
    - Proving too little, } real inconsequence.
    - Proving too much, }
  - *Error in distinction*,
    - Distinction without a difference.
    - Confusion of cross divisions.
- CONFUSED REASONING,
  - Saying other than is meant.
  - Not distinguishing different senses of the same word.
  - Neglecting the means of distinction and division which grammar provides for the clear development of thought by words.
- DISJOINTED REASONING, } *Ignoratio elenchi*,
  - Omitting necessary propositions.
  - Proposing too much or too little.
  - Deviation from the proposition.
  - Discoursing short of the proposition.
  - Discoursing wide of the proposition.

ERRORS IN DETAIL WHICH COME UNDER THE GENERAL HEAD OF VERBIAGE.

6. BEGGING THE QUESTION is verbiage exhibited in such form of the *petitio principii*, that the pretended reasoner, in a more palpable way than under the other forms, begs *that* to admitted for a reason of what he asserts, which is no reason at all, but only the assertion repeated in the same, or in tantamount words: as,

"Pride is odious, because it is disliked by all; for it produces universal hatred."

Here, the words *because* and *for*, lead us to expect a development of the cause that makes pride odious, and of the effects which prove it so; instead of which we have two propositions which only repeat, in tantamount words, what the first had said. Omit the words *because* and *for*, and the defect disappears. We shall indeed have three propositions each meaning the same thing; but such repetition, though logically superfluous, is not always a fault in rhetoric, and in the present instance must be indulged by logic, as minister to the sister art; as, "Pride is odious;—it is disliked by all;—it produces universal hatred." Such is one way of correcting the fault, namely, by not raising the question of the truth of what is asserted, and therefore making no pretence of giving a reason for it.* But the mode of correction more agreeable

* To give a reason is but to develop our knowledge with greater detail. We have always to judge whether this is, or is not expedient. In saying *Pride is odious*, we already express a conclusion from premises, namely

to logic will be, to carry out the purpose of *because* or *for*, by adding a legitimate reason; for instance, "Pride is odious; because our self-love makes us feel it as an injury done to our own importance;"—which is an argument from the topic *cause*: and "Pride is odious; for all persons shun the society of the proud;"—which is an argument from the topic *effect*.

7. IDENTICAL PROPOSITION. This form of *petitio principii* differs from the last in no greater degree than its name indicates. It is a grammatical period whose two parts are identical in meaning. Thus in saying "All being exists," we have a period dividing into nominative and verb; but the one means the same as the other, and therefore in putting them together, there is no resulting sense—no conclusion from the two, but only a repetition of the same thing under a different form. Again, in saying "As the tree enlarges, so does its size increase," we have a period dividing into two sentences rendered grammatically dependent by *as* and *so;* but the one sentence means exactly what the other means, and no sense results from their grammatical union. So likewise in saying "Home is home," we have a grammatical sentence dividing into *home*, the nominative, and *is home*, the verb; and if we understand no more from the latter, than from the former, the sentence says nothing: it is, in fact, an illogical, because an identical proposition; though rhetoric vindicates it, by implying under the verb a great deal more than it actually expresses. The following are other examples that neither logic nor rhetoric vindicates:

"The vain and empty glory of this world, is but nothingness."

Here the verbiage will be corrected, and the sentence become rational, by leaving out "vain and empty."

"Foolishly do the vain triflers we so often meet with in life, squander their useless hours in futile pursuits, while they neglect the needful duties which they ought to perform, and are guilty of continual faults which they ought to avoid."

---

from *pride*, and *is odious*. Knowing what pride is, we know the feeling it produces in others; knowing what it is to be odious, we know what effects go along with the quality. In the deductive process, the alleging of reasons is nothing more or other than bringing forward prominently what thus lies behind the premises of our first proposition.

The verbiage of this example will appear by comparing it with the following correction:

"Many whom we meet with in life, neglect their duties, and squander their hours in futile pursuits."

"A good definition should include all the things to which the word defined is applied."

The verbiage lies in using *good* in constructing the nominative, along with *should* in constructing the verb. We ought to say, either—"A definition should include," &c., or—"A good definition includes," &c.

8. EXPLAINING A THING BY ITSELF. This form of *petitio principii* differs so little from the last, that it may scarcely seem to require a distinct designation. But as, when only a *verbal* explanation is meant, using another word having exactly the same signification is not a fault;* the learner may require to be reminded that this will be verbiage when the *thing* is to be explained; that is to say, the equivalent word will not explain the thing, but only be another word for it. It is, for instance, a fair verbal explanation of *Justice* to say that it is the quality of being *just;* but it is a cheat upon the understanding to deem that, by saying so, we have in any degree developed our knowledge of the thing. We should equally fail, though the fault might be more concealed, if, with an exactly equivalent meaning, we were to use a different word; if, for instance, we said, justice is the quality of being *equitable.* Hence, the following passage is a failure:

"Justice regards both magistrates and private individuals: the former show themselves to be influenced by it, when they make an *equitable* distribution of rewards and punishments; the latter, when they are sincere in their words, and *just* in their dealings."

Let *impartial* and *honest* be substituted for *equitable* and *just*, and the verbiage will be corrected.

9. REASONING IN A CIRCLE. This form of *petitio principii* takes place, when we go on proving one proposition by another, on the understood condition that the last, which is to establish the rest, will be self-evident: and then, instead of fulfilling the implied condition, we return to our first assertion, and use *that* for our proof, when it was the very

* See Chapter III. Section 5, page 134.

thing to be proved. Thus, it is obvious verbiage to say, "Pride is odious, because it offends our self-love; and it offends our self-love, because it is odious." The fault is less obvious, but equally present in the following example:

"Wealth makes the mind uneasy; for it fills it full of care; of care for its increase; of care, lest it should diminish; of care to prevent one portion from being lost, while we are watching for another: *and that all these effects are engendered by the possession of wealth, is established by the fact, that wherever we find riches, we are sure to find uneasiness and disquietude also.*"

The latter part of this example, so far as it pretends to be an argument for what precedes, is verbiage.

* We proceed to a third example:

"The formal syllogism of Aristotle is the test of all valid reasoning, all reasoning being invalid which conforms not to its formulæ: *e. g.* 'All vegetables grow: an animal grows: therefore it is a vegetable.' 'All wise legislators suit their laws to the genius of their country: Solon did this: therefore he was a wise legislator.' Now both these [apparent] syllogisms, and all similar to them" (so the argument continues,) "refuse the test which Aristotelian logic provides, and both of them" (so the argument still continues,) "are instances of invalid reasoning."

When, in proceeding to answer the argument, it is asked, why the latter instance, as well as the former, is an instance of invalid reasoning, the answer given is this;

"That the latter as well as the former, refuses the test which the Aristotelian syllogism provides."

Here, it is clearly evident that the reasoner goes back to the proposition he had to prove, namely that "the formal syllogism of Aristotle is the test of all valid reasoning," in order to answer the question, why the reasoning is wrong in saying, "All wise legislators suit their laws to the genius of their country: Solon did this: therefore he was a wise legislator." That the reasoning here is confusedly expressed, we acknowledge; † but that it is wrong reasoning, can never be established by so palpable an argument in a circle as the

* See the second foot-note, page 180.

† The true character of the fault with which this latter of the two examples is chargeable, will be assigned in the next Section.

instance supplies. And yet it is one of the modes of proof pursued in favour of Aristotelian logic, in the most popular logical treatise of the day.

10. IRRELEVANT PREMISES. Premises are irrelevant when what is said to follow from them, does not follow; as, "Every horse is an animal; sheep are not horses; therefore they are not animals." It is a designation by which we may distinguish one of the modes of the general fault called a non-sequitur, namely, that in which the premises are quite void of consequence.

*If our theory of deductive logic is true, a *non-sequitur* in thought is impossible. In the induction of knowledge, that is, in gathering it into the mind, we may indeed make the most unwarrantable assumptions, and the most fatal mistakes, and in developing our knowledge these errors will re-appear; but they will appear as premises, with no possibility (if we do not give up thought for words) with no possibility of flaw in the validity of our conclusions: inasmuch as every conclusion from premises, is but the fact of developing our knowledge, real or assumed, and of understanding our premises; and with relation to its actual premises, a conclusion cannot but be what it is. We can no more choose in the case, than we can choose in the case of sensation;—than we can choose, for instance, what our sensation shall be, when certain food is offered to the palate, or a certain shape to the eye. Let us know what *red*, and also what *earth* is, and the moment these are embraced as premises by the understanding, is the moment of our being aware of the meaning which, as one expression, they signify; and this is the conclusion from those premises; which conclusion, if the premises are not mistaken, cannot be other than it is. In like manner, let us know that *men are mortal*, and that *kings are men*, and the moment the understanding embraces these as premises, is the moment of our being aware of the conclusion, that *kings are mortal;* a conclusion which, with regard to the actual premises, cannot be avoided, and cannot but be what it is.

A false conclusion, then, with relation to its actual premises, being impossible, we have to ask how there can be such a thing as a false conclusion at all:—and the answer is,

---

* See the second foot-note, page 180.

that, in the deductive process, there can indeed be no such thing, except when words are made to take the place of thought. Let us know what *square* means, and what a *circle* means, and it will be impossible for the understanding to embrace these as premises, and receive the grammatical combination as a conclusion :—nevertheless, the grammatical combination, *a square circle*, may be offered as a conclusion, and may be by him accepted who takes words for thought. In like manner, let us know what vegetables are, and what animals are, and it will be impossible—though our knowledge includes the fact that they both grow—it will be impossible for the understanding to embrace these as premises, so as to receive, as a conclusion, that an animal is a vegetable. Yet this again may be offered as a conclusion, and may again be by him accepted, who reasons not *by means* of words, but imitates that process by operating *with* words, and failing in the operation, which it is not difficult to do, reaches *that*, which in the true process of reasoning, is an impossible result. Now if the shrewdest of the present, or any other generation, were to employ his wits in devising an instrument by which, in failing to use it according to rule, it should be possible to come to conclusions of the kind here exemplified, he would not be likely to contrive anything so extremely ingenious as the instrument which has been in existence, and partially in use for some two thousand years,—the syllogism of Aristotle, with its apparatus of extremes and middle term. For this instrument, as its advocates declare, proposes rules of reasoning, " which have nothing to do with the truth or falsity of premises, but merely teach us to decide, not whether the premises are fairly laid down, but whether the conclusion fairly follows from the premises." * If the theory of our logic is true, this is something more preposterous than providing spectacles for them who cannot but see clearly, or crutches for them who cannot but walk well. Let us, however, take the instrument as it is put into our hands; and, acknowledging that it guards the reasoner against a wrong use of its forms,—acknowledging this, we say that in using it, we are rendered liable to traps and snares, which would not come in our way, if we reasoned without it. " The

* Whately's Logic: Province of Reasoning, Chap. i. § 1, ad finem.

conclusiveness of an argument," say its advocates, "is" (by this instrument) "made manifest by the mere force" (form) "of the expression, i. e. *without considering the meaning of the terms.*"* Admitted:—but when the reasoner has dismissed all attention to the meaning, there is at least a possibility that he should fail to employ the exact form, and employ one which seems a legitimate syllogism, but is not one: "All vegetables grow: an animal grows: therefore it is a vegetable." The apparent conclusion is of course a *non-sequitur* both in Aristotle's logic and in ours:—in Aristotle's, with reference to its defect in *form*, the fault is specially described as an *illicit process of the major*, or non-distribution of the major term in the premises:—in ours, we call it *irrelevant premises*, that is premises that cannot be embraced by the understanding—cannot be correctly understood—so that the last proposition is inevitable in the act of understanding them. And the practical difference we insist on, is this,—that in using Aristotle's instrument, there may occur the failure which produces the apparent conclusion:—in using language for the purpose of reasoning as our theory requires, the failure cannot, *in the shape exemplified*, occur.

Before we conclude the present section with a few examples to the same purpose as the foregoing, we must vindicate from the charge of *irrelevant premises*, though we cannot from that of *illicit process*, an example associated in Section 9 above, with a foregoing example, in which an animal is made a vegetable. That other example was, "All wise legislators suit their laws to the genius of their country: Solon did this: therefore he was a wise legislator." According to our logic, this is correct though *confused* reasoning; and as an example of confused reasoning, it will again occur in a subsequent section. It is correct, because the argument with its conclusion, "Solon suited his laws to the genius of his country, and therefore was a wise legislator," implies, by its being put forward as an argument for that conclusion, the datum which really exists in the understanding of the reasoner, namely that "All are wise legislators who suit their laws," &c. The confusion lies in his previously saying *other than he means;* which

* Whately's Logic: Synthetical Compendium, Book (or Chap.) II., Chap. (or Part) iii., § 1, ad finem.

confusion is removed by removing the irrelevant proposition, when what remains will be the premises, namely datum and argument, compendiously expressed: or the irrelevant proposition may be changed so that it shall accurately correspond to the datum in his mind.

Of examples of *irrelevant premises*, the snares and traps into which we are liable to run through an incautious trust in Aristotelian forms, and a non-observance of their rules, the following are appended as further specimens.

"If the hour-hand of a clock be any distance, say a foot, before the minute-hand, the last, though moving twelve times faster, can never overtake the other. For while the minute-hand is moving over those twelve inches, the hour-hand will have moved over one inch; so that they will then be an inch apart; and while the minute-hand is moving over that one inch, the hour-hand will have moved over $\frac{1}{12}$ of an inch; so that it will still be a-head: and again, while the minute-hand is passing over the space of $\frac{1}{12}$ inch, which now divides them, the hour-hand will pass over $\frac{1}{144}$ inch; so that it will still be a-head, though the distance between the two is diminished; &c. &c. &c.; and thus it is plain we may go on for ever. Therefore, the minute-hand can never overtake the hour-hand."

This example, which brings us to a conclusion contradictory to our clearest experience, is liable to be startling to a person who has any reliance on the mere forms of reasoning, more especially if he is acquainted with the truth, that, in mathematics, there are lines under certain conditions, which, though they are always approaching, can never meet. But this, which in certain cases can be true of abstract lines, that is lines unlimited by place, time, or dimensions, cannot, of course, be true in physics. How, then, is the *appearance* of truth given to the foregoing form of reasoning? By relying on the *form*, so as to keep the true *datum* or knowledge out of sight; namely, that "the hour-hand can never overtake the minute-hand *within the space at which they are at any time asunder*, but that this space will continually diminish till at last there shall be no space between them." It is now evident that no argument can be joined with this datum, which shall not be irrelevant to that which is appended as a conclusion,—namely,—"Therefore the minute-hand can *never* overtake the hour-hand."

"None but whites were civilized; the ancient Germans were whites; therefore they were civilized."

"None but whites are civilized; the Hindoos are not whites; therefore they are not civilized."

"None but civilized people were whites; the Greeks were whites; therefore they were civilized."

These are traps intended for the non-Aristotelian reasoner, who, in trying to grasp the knowledge held out in the premises, is beset by difficulties which the Aristotelian does not concern himself with; difficulties arising from the nature of the subjects, inasmuch as white men and dark men, civilized men and uncivilized men, are not separated in point of fact by any determinate line, but run into each other. *Our* reasoner will hence be inclined to deem each example inconclusive; and when the Aristotelian desires him to take the premises in each for granted, and then to distinguish the faulty example, he will find no one faulty beyond some confusion of expression; inasmuch as, in each instance, the argument (the second proposition) involves the *datum* required, in the very act of being put forward to reach the appended conclusion. Thus the *datum* which he understands in the first example, is, "All whites were civilized;" nor is it of moment to him, (except from the confusion it creates,) that the first proposition is irrelevant *as there expressed*, since the second and third contain, to his understanding, the premises he is called upon to admit. The Aristotelian, indeed, exclaims "Non-sequitur—undistributed middle;" but what is this to him who reasons, not *with* words, but only by *means* of words? or what admission has been drawn from him, which is likely to mislead his understanding in the future course of the reasoning?

"Light food is good for me: (i. e. food light of digestion.)
But this food is light: (i. e. light in specific weight.)
Therefore, it is good for me."

"Projectors are unfit to be trusted: (i. e. people who are always projecting.)
But this man is a projector: (i. e. a man who has brought forward a project.)
Therefore, he is unfit to be trusted."

"What is bought in the market is eaten: (of course, after being cooked, if necessary)
But raw meat is bought in the market:
Therefore, raw meat is eaten."

"All the angles of a triangle are equal to two right angles: (i. e. all taken together.)
This is the angle of a triangle: (i. e. one of the angles.)
Therefore, it is equal to two right angles."

"Five is one number:
Three and two are five: (i. e. they make up when joined.)
Therefore, three and two are one number."

These are traps for the Aristotelian reasoner, and not for ours. It is true, the latter may, in the induction of his knowledge, have been led, in such a case as the first, to bring under one term things in their nature different, and hence, because his premises were wrong, to deduce, in thought and practice, a wrong conclusion;—to deem, for instance, as indicated by the example in view, that food which weighs light in proportion to its quantity, is on this account light of digestion. But being taught to look to the subject-matter of his premises as the only source of invalidity in his conclusions, he is surely less likely than a reasoner not so taught, to rest satisfied with his deductions. The other examples can scarcely deceive him for a moment: to his understanding, the premises in all will at once appear irrelevant to their respective conclusions; nor can they, in fact, deceive any one but a reasoner who gives up all attention to the subject-matter of his argument, and trusts entirely to its form. Indeed we may fairly ask of the Aristotelian reasoner, why, on *his* principles, these forms of argument are not received? To say that we must not here rely on the forms, but go back to the meaning of the terms, is to confess, after all, that the subject-matter is everything, and the forms nothing. Hence, it is matter of complaint with Dr. Whately, that when Aristotelian teachers come to fallacies thus protected, as it were, by the very form of the syllogism, they have recourse, in order to expose them, "to a loose, vague, and popular kind of language;"* which may be translated to mean, that they now employ, for the first time, the language of common sense, in order to reach the common human understanding. Dr. Whately would have them more cautious, reminding them of the shelter of technical language, by which the esoterical disciple may still be kept aloof from the common

* Whately's Logic: Book (or Chap.) III. of Fallacies: Introd.

herd; as, for instance, by denominating the errors in the foregoing examples, *ambiguous middle; confusion of different intentions; fallacium a dicto secundum quid ad dictum simpliciter*, &c. Will an age so advanced as the present, tolerate much longer this learned trifling?

11. PROVING TOO LITTLE.—This must be a non-sequitur; a physical or real one, the facts of the case not reaching what we seek to establish; as when we say, "Our friend John never cheats or steals; and therefore he is a man of *every* virtue." The words *and therefore* are verbiage: what follows them may be true, but not true as a consequence of what precedes. The same fault, a little more concealed, is exemplified in the following:

"No man can be happy who pursues nothing but pleasure. For to procure what the world calls pleasure, requires money, health, and spirits; but most men who always pursue pleasure, will be always wanting some of these."

Nothing more is here proved, admitting what is averred, than that *most* men who pursue pleasure cannot be happy. The full proof would not be difficult by a wider induction of particulars; and it is only necessary to remind the young logician, that when he intends to establish a truth, he should bring forward all the facts, which may force a reasonable mind to admit it. He might, for instance, aver, as to the proposition in view, that, "the constant pursuit of what the world calls pleasure, unwarranted as it is by reason and conscience, will *ever* be found to harass the spirits, undermine the health, produce languor and satiety, and, at last, instead of real enjoyment, leave nothing to the feelings but disgust and pain."

Returning to the uncorrected examples, it may be observed, that in all cases of *proving too little*, we supply, mentally, an unwarranted datum; and we prove too little, because that datum must be proved before our conclusion will hold. Thus, in the first example above, the implied datum is, "He who never cheats or steals, is a man of every virtue." Grant this, and the conclusion is undeniable: but it cannot be granted, and hence the defect of having proved too little. It is indeed the error of our lives to take the *data* which our wishes, our passions, our prejudices suggest, before we have accumulated knowledge on adequate grounds. But the error,

be it observed, is always in the inductive process. In this process, the conclusion, which is properly and strictly called an *inference*, never follows *necessarily* from the premises, because it is never included in them, but is more or less probable up to the highest degree of certainty which our knowledge can reach; a certainty different *in kind* from necessary certainty, though it is the certainty from which flow all our necessary conclusions in the deductive process. Let us take the following instance: "This stone, which I have lifted from the ground, and let go, *has* fallen to the ground again: therefore, if I lift it again, and again let it go, it *will* again fall to the ground." The inference is not a *necessary* conclusion; but who, for a moment, doubts its certainty? That on which its certainty rests, is the wide, universal induction of particular facts, which, never having failed, the habit of our understandings leads us to accept as what never will fail.* In the deductive process, then, the datum which the foregoing inference supplies, has the utmost possible degree of strength,—namely, that "Every stone lifted from the ground and let go, having fallen to the ground, every stone that shall be lifted and let go, will fall." Very different in degree of certainty, are the data supplied by innumerable inferences, which we incautiously accept in the accumulation of our knowledge! Let us take a few by way of specimen:

"I am sure the man is a rogue, he has such an evil-looking face:" (i. e. He has an evil-looking face; *therefore* he is a rogue.)

"I have often observed that when it rains on Friday it also rains on Sunday: now yesterday was Friday, and it rained hard: *therefore* I am sure it will rain to-morrow."

"I got well while I was taking this drug: *therefore* it cured me."

"I have never begun anything on a Friday without being unlucky: *therefore* it is unlucky for any one to begin anything on a Friday."

"Everybody suspects John of having taken my purse: *therefore* he stole it."

---

* See, on this subject, the explanation afforded by Mr. James Douglas of Cavers, quoted in the note to Section 15, Chapter IV., page 152.

"This dish which people praise so much, is, to my taste, very nasty: *therefore* it is unfit for anybody."

"Miss A., according to my idea, is very ugly, though I hear her beauty so much cried up: *therefore* she is very ugly."

"This food is extremely grateful and nutritious to the people living within the tropics: *therefore* it is fit food for all people."

In all the foregoing examples, after the prior shape of the first, the word *therefore* is so used as to be palpable verbiage, and thus the fault is in each made more manifest than it would be, if couched in more common forms of speech. But the more it is concealed, the more cause has the young logician to be on his guard. He must remember that whenever he reaches an inference by too narrow an induction, his conclusion in the development of his knowledge, necessary as it will be from the datum he *assumes*, must at the same time be without value; for he will always, in such a case, *prove too little*. The conclusion he reaches will not be a logical, or, in other words, a metaphysical non-sequitur, but it will be a physical or real one.

12. PROVING TOO MUCH.—This will also be a real non-sequitur; because if our proof includes more than *can* be true, that which *may* be true will not follow from it. It may be true that the drug which John took when he was ill cured him; but when, in order to establish this presumed truth, we aver that the illness of Samuel, and that of Thomas, and that of William, were cured by the same drug, the several diseases being distinct and in some degree opposite in character, so that the same drug could not have had the same effect on all, we prove too much, and the proposition, "*Because* John took the drug, he got well," remains unproved by it. Hence the connecting word *because* is verbiage, and to correct the example, we must leave it out, and put *and* between the sentences.—The same fault of proving too much occurs in the following example:

"No one can live a happy life who pursues nothing but pleasure. For it is in the nature of things that when a man gives himself up to one pursuit, it becomes tiresome. Therefore, people who are always following pleasure, do not take delight in it, but pass a troubled, uneasy, dissatisfied life."

If it were generally true, as here said, that when a man gives himself up to one pursuit, it becomes tiresome, then would it be true that in giving himself up to the pursuit of wisdom, knowledge, virtue, or other excellent thing, the pursuit would grow tiresome; a conclusion which we know to be false. It is true only of pleasure, that when pursued to the exclusion of other occupations, it no longer produces the effect desired from it, but becomes disgust and pain.

In these last examples, as well as in those of the previous section, we supply, mentally, an unwarranted datum. The difference is, that, in the former cases, the induction on which we *assume* each datum, is too narrow, that is, it has not collected a sufficient number of facts to warrant the datum; while in the latter case it is too wide, that is, it has included more facts than there was just ground for. An example of the latter occurred in the last section but one; in which a reasoner is supposed, in the induction of his knowledge, to have included under the word *light*, things of a very different nature, so as to persuade himself that all light food is good for him. The argument proves too much; for it includes all food specifically light. Further experience may correct the error; and then he will be aware why his former conclusion was wrong, namely, that the argument included in the word *light*, proved too much, and therefore, for his true instruction and benefit, proved nothing.—A few more examples of the same kind, may be sufficient to show how liable we are to these conclusions which flow from *proving too much.*

"Liberty is a blessing to man;" (without limiting the circumstances that make it a blessing;) "*therefore*, let us impose no laws on these uninstructed men, but allow them to do whatever they wish."

"Pleasure is a good which I eagerly desire;" (without discriminating between pleasure which is enduring, and pleasure which must turn to evil;) "*therefore*, I will plunge into the sensual revelry which invites me on every side."

"Wealth procures great advantages;" (without discriminating advantages, which, by itself, it cannot procure;) "*therefore*, I will accumulate wealth in every way, and at all hazards."

"Rank and power are highly desirable;" (without discri-

minating the circumstances that make them so;) "*therefore*, I will scruple no means to raise myself to rank and power."

"To make others fear to injure me, is judicious;" (without regard to the fact that fear may keep all at a distance who would otherwise befriend me;) "*therefore*, I will never allow the least injury, or even the least slight, to remain unrevenged."

"A. B. is our representative in parliament;" (without adverting to the variety of opinion in those he represents, and the understood condition, that he who is a member of *parliament*, ought to consult the interests of the nation at large, as well as of his constituency;) "*therefore*, A. B. is, on this question, bound to vote as we, namely C. D. and E., direct him."

The conclusion which the reasoner attains in all these instances, though, by granting him in each the implied datum, it is logically (metaphysically) correct, is nevertheless really (physically) false; in other words, a *real* non-sequitur.

13. DISTINCTION WITHOUT A DIFFERENCE.—We now reach another of the general forms of verbiage, namely, *Error in distinction or division*, of which, one of the species is that named above. It may be sufficient to warn the learner against the fault above-named, by the following examples:

"I propose to consider, first, the evils which arise from procrastination; and then, the miseries we should avoid by performing our duties at their proper time and place."

The reasoner is guilty of verbiage in this distinction; or, if he really means different things, he must mean "first, the *evils* of procrastination; and then, the *benefits* of performing," &c.—The following are two other examples:

"Books are the receptacles of knowledge, and the depositories in which the collected wisdom of ages is treasured up."

"Docility is a readiness to receive instruction, and a willing obedience to those who teach."

In both these instances, the word *and* converts what follows into verbiage: leave it out, and the verbiage is corrected. We shall, it is true, then have, in each example, two expressions to the same purpose; but these will be used as two nouns are used in apposition, the one to make the meaning of the other better understood, without pretending to add any-

thing new to the meaning.—And, as adding what is no addition, always amounts to a distinction without a difference, so likewise does disjoining what is not distinct; as,

"To be neither merciful nor compassionate, is unsuitable to the condition of man."

Here, to avoid verbiage, we must say, "Not to be merciful—not to be compassionate, is unsuitable," &c.:—or, avoiding the repetition, "Not to be compassionate is unsuitable," &c.

In rhetoric, the earnestness of a speaker to make the most of a point, frequently produces a redundancy of words when nothing is added to the meaning .But in logic, such a redundancy is a fault, and, if very palpable, will not answer the purpose even of the rhetorician. The following sentences * are therefore faulty.

"This great politician desisted from, and renounced his designs, when he found them impracticable."

"He was of so high and independent a spirit, that he abhorred and detested being in debt."

"Though raised to an exalted station, he was a pattern of piety, virtue, and religion."

"His end soon approached; and he died with great courage and fortitude."

"He was a man of so much pride and vanity, that he despised the sentiments of others."

"Poverty induces and cherishes dependence; and dependence increases and strengthens corruption."

"This man, on all occasions, treated his inferiors with great haughtiness and disdain."

"There can be no regularity or order in the life and conduct of that man, who does not give and allot a due share of his time to retirement and reflection."

"Such equivocal and ambiguous expressions, mark a formed intention to deceive and abuse us."

"His cheerful, happy temper, remote from discontent, keeps up a kind of daylight in his mind, excludes every gloomy prospect, and fills it with a steady and perpetual serenity."

14. CONFUSION OF CROSS DIVISIONS.—A cross division is a division for some purpose, or on some principle, distinct from

* Taken from Murray's Exercises: a key for correcting the instances will be found in the Appendix.

another division. Thus, a bookbinder divides books into folio, quarto, octavo, duodecimo, &c.: a philosopher into poetical, historical, &c.: a philologist into Greek, Latin, English, French, &c. Now a logician would be guilty of a great error, if he were to confuse these several divisions by dividing books, in general, into the several species of poetical, historical, folio, quarto, Greek, Latin, &c.; for these are not divisions under one general head which includes them, but divisions under particular heads for special purposes. Suppose, therefore, that in a theme on History the writer should set out with a division into Sacred, Profane, Ancient, and Modern, he at once plunges into verbiage; because sacred history is not distinct from ancient, but happens to be included in it; and because profane history is not distinct from modern, but happens to include it. The divisions are nevertheless just, if he does not confuse the one set with the other. —We run into the same fault when we say,

"The human body is divided into the head, trunk, limbs, and vitals."

For the vitals are included in the head, or trunk, or both; and the division should be into "head, trunk, and limbs;" so that the vitals, if spoken of at all, may be taken in subordination to what includes them.

The following are other instances * in which the fault is sufficiently apparent:

"The things brought out to me were some square, some white, some artificial, some round, some blue, some natural, and some red."

"He was a man of great temperance and high birth, very generous, and quick to discover fraud, of extensive riches and exalted virtue."

"In treating of Poetry, I shall consider it under the heads of Epic, Classical, Ancient, English, Lyric, Written-in-Rhyme, Modern, Dramatic, and Written-in-blank-Verse."

"Men, as to constitution, temper, and habits, are either phlegmatic, gay, devoted to business, sanguine, gloomy, devoted to pleasure, or choleric."

Errors in detail which come under the general head of Confused Reasoning.

15. Saying other than is meant. The faults now to

* A key for correcting them will be found in the Appendix.

be noticed are faults of expression; being faults of reasoning only so far as faulty expression can scarcely fail to cloud and confuse the reasoning. We assume Logic to be the art of developing knowledge for our own security and satisfaction; but always with a view of applying our skill, ultimately, to the purposes of rhetoric, that is of informing, convincing, and persuading others. Now if we say other than we mean, although what we mean may, in some sort, be present to our own understanding, and although others may not altogether mistake what we mean; yet there will, on both sides, be a degree of confusion, which it is among the objects of logic to prevent. The following examples, therefore, though faulty only in expression, are properly deemed illogical.

"Ambition is so insatiable, that it will make any sacrifice to attain its objects."

"As to be content with what we have, is to be truly rich, it follows that no covetous man is truly rich."

"Solon was a wise legislator; for all wise legislators suit their laws to the genius of their nation."

Each of these examples exhibits a *non-sequitur* in expression; but it is in expression only. The meaning which the reasoner designs to convey, and that which, in spite of the faulty expression, the hearer or reader receives, is the following: "Ambition is so insatiable, that, however much it gets, it will still desire more, and make any sacrifice to attain it." "As no one is truly rich but he who is content, it follows that no covetous man is truly rich." "Solon was a wise legislator; for all are wise legislators who suit their laws to the genius of their nation."—The expression in each example may be made correct in another way, namely by foregoing the logical connection understood between the facts, and stating them as things that only happen to come together; as "Ambition is insatiable: it will make any sacrifice to attain its objects." "To be content with what we have, is to be truly rich: no covetous man is truly rich." "Solon was a wise legislator: he and all other wise legislators suit their laws to the genius of their nation." This way of correcting a non-sequitur is left to our choice in cases like these, when the fault was only in the expression, and not in point of fact: but we have no choice—we must take the latter mode, when the non-sequitur is of the latter kind; as "All vegetables grow; an animal

grows:"—we cannot connect these by any logical consequence; they must be left in their independent state, or joined in expression as we usually join things that happen to come together; for example, "All vegetables grow, and so does an animal." Again in proposing to join *round* and *square*, we find them irrelevant to any conclusion,—in other words they will not make sense, and therefore instead of saying *a round square*, we must leave them independent of each other's meaning, and say *a round, and a square.*—Returning now to examples in which the non-sequitur is only in the expression, we may indicate to the learner, as specimens in point, all those which were furnished in the Manual of Grammar (pages 92, 93,) to discriminate between grammar and logic. Thus, "He that was dead, sat up:"—Each being taken strictly, the two members of this sentence cannot unite and imply one sense: but the former member is neither meant nor received according to its strict import; and therefore it does unite with what follows. The same thing might be shown of all the other examples at the pages referred to; yet they all come under the censure of confused reasoning, (except one or two vindicated by rhetoric,) because in all of them the reasoner *says other than he means.*

It must be further borne in mind, that not only should an expression convey none other than is meant, but should likewise be free from a double meaning, though one of the meanings may be the one intended. Sometimes, as in the case of pretended prophecy, there may be a purpose in equivocation; but with such a purpose, logic is not concerned; and in correcting a few more examples* continued from the Manual of Grammar, the student will take care that each sentence shall convey one, and only one meaning.

"Pyrrhus the Romans shall I say subdue."

"The duke yet lives that Henry shall depose."

"The rising tomb a lofty column bore."

"And thus the son the fervent sire addressed."

"And all the air a solemn stillness holds."

"He was mounted upon a hot and fiery steed, which his aspiring rider seemed to know."

---

* Some of them are from Murray's Exercises: a key for the correction of each, is furnished in the Appendix.

"If this day happen to be Sunday, this form of prayer shall be used, and the fast day kept the next day following."

"A collection is making to protect and uphold such electors as refused, contrary to their desires and consciences, to vote for A. and B. regardless of threats, and unmindful of intimidation."

"He was more than commonly civil to me."

"You can only arrive in time by starting early."

"Though he had been charitable to others, he found but a few friends in his own extremity."

"Persons not having an income amounting to a hundred and fifty pounds a year, are not liable to the income-tax."

"The Romans understood liberty at least as well as we."

"Theism can only be opposed to Polytheism or Atheism."

"These are not such designs as any man, who is born a Briton, in any circumstances, in any situation, ought to be ashamed or afraid to avow."

"The eagle killed the hen, and eat her in her own nest."

"It has been said that not only Jesuits can equivocate."

"You will not think that these people, when injured, have the least right to our protection."

"Solomon, the son of David, who built the temple of Jerusalem, was the richest monarch that reigned over the Jewish people."

"Solomon, the son of David, who was persecuted by Saul, was the richest monarch of the Jews."

"Lisias promised his father, never to abandon his friends."

"The Divine Being heapeth favour on his servants, ever liberal and faithful."

"Every well-instructed scribe is like a housekeeper, who bringeth out of his treasure things new and old."

"Dryden makes a very handsome observation, on Ovid's writing a letter from Dido to Eneas, in these words."

"Imprudent associations disqualify us for the instruction or reproof of others."

16. NOT DISTINGUISHING DIFFERENT SENSES OF THE SAME WORD. This fault is the opposite of one which was ranged under the general head of Verbiage; namely, a distinction without a difference. Our present title might be, a difference without a distinction; but it will be better to limit our examples to those which exhibit the fault in the particular way

described above, namely, by not distinguishing different senses of the same word. Be it observed, however, that we are concerned with this fault, only so far as it *confuses* the reasoning, and not with that effect which was the subject of a previous section, where it is shown that the reasoner, in the induction of his knowledge, is led to include under the same word, as things of the same nature, those that are essentially distinct; and hence, though he reasons rightly in the deductive process, to come to a wrong conclusion, because his previous knowledge is wrong. (See Sect. 12, at page 201, where the word *light* is alluded to.) In the following, and other similar examples, the reasoning, independent of the words, is correct; but the expression makes it confused:—

"To write well is an accomplishment of the first importance, because we form an immediate judgement of a person's education from the manner in which he writes. If we receive from any one a letter scarcely legible, scrawled rather than written, we hardly think well of the writer's education, though perhaps the sentiments may be tolerably expressed. But if the language is ungrammatical, and all the sentences confused; in short, if there appears a total deficiency of skill in the art of writing, we immediately conclude that the person is altogether ignorant and illiterate."

Here *bad writing* in the sense of *bad manuscript*, and in the different sense of *bad composition*, are confounded. The intended reasoning is made clearer thus: "To write a fair hand is an accomplishment of much importance, because we often form an immediate judgement of a person's other acquirements from the hand he writes. But it is of much more importance to obtain a correct and graceful style of expression. The one is a manual, the other, a mental art. If we receive from any one a letter scarcely legible, scrawled rather than written, we hardly think well of the writer's education. But if the language is ungrammatical, and all the sentences confused; in short, if there appears a total deficiency of skill in the art of composition, we," &c.

The following is another example:

"It is better to be sensible than witty. A witty man may raise admiration, but he seldom gains love. A sensible man, though perhaps not much listened to at first, gains constantly increasing attention, till, at last, he is consulted by all,

and loved by all. To be sure it may be a disadvantage to be too sensible; for instance, to be too sensible to reproach, or ingratitude, or neglect. But the very quality of being sensible will enable the person to surmount this failing, and render him superior to the injustice of the world."

Here, there is confusion between *sensible in understanding*, and *sensibility on account of what others do or say*. Correct part of the example thus: "To be sure, a sensible person is liable, like others, to incur unmerited reproach, ingratitude, or neglect. But the quality of being sensible, will enable him to see such dispositions in their true light, and render," &c.

A third example may be added:

"My friend Brown was the strongest man I ever knew, and yet sometimes the most timorous. In body and limb, he was so nervous, that he could overcome, in wrestling, men who were twice his weight; and yet, if he had to pass through a church-yard at night, his nervousness was such, that he would shake all over. So we see that the strongest frame does not protect a man from superstitious fears."

The confusion here is between *strong in bodily nerve*, and *liable to fears which affect the nerves*. Instead of saying "his nervousness was such," say, "his timorousness was such," and the example will be corrected.

17. NEGLECTING THE MEANS OF DISTINCTION AND DIVISION WHICH GRAMMAR PROVIDES FOR THE CLEAR DEVELOPMENT OF THOUGHT BY WORDS.

The means which grammar provides, are sentences periodic and non-periodic; paragraphs, otherwise called sections; and parts made up of paragraphs or sections. All that grammar looks to in these, is the accuracy of the outward structure. It is for logic to take care that the structure has its foundation in the purposed development of thought, so that there shall be union where that purpose requires union, and distinctness, where it requires distinction. *We must not overload a sentence, or paragraph, or higher division of discourse, with what cannot be readily apprehended as a part of its purpose.* Hence the young theme-writer fails in the examples given hereunder:—

Example 1. "Courage leads us to face danger without fear; fortitude, to bear calamity without complaining, and is a virtue all ought to possess; for being, as we all are, born to trouble, afflictions of some kind must fall to our lot."

The proper business of the former part of this sentence appears to be, if clearly settled in the writer's intention, to define fortitude in contradistinction to courage; and that purpose being completed, the sentence should have ended, namely, at the word *complaining*. What follows should be not only in a different sentence, but should begin a new paragraph with the word *fortitude* repeated as nominative to the verb *is*. For it appears that the reasoner, having made his way clear by defining his subject, is about to consider its necessity, &c.

Example 2. "The high-born, the rich, and the beautiful, are peculiarly exposed to flattery; and the sweet incense is offered to them in abundance, by those whom all good men justly abhor for their deceitful servility."

In this sentence, the reasoner proposes to show the dangers arising from flattery which attend birth, wealth, and beauty, and also to show the baseness of flatterers. These purposes should be enunciated distinctly; they should not be attempted even in the same paragraph. Let us say that the first paragraph shall confine itself to the former object, and begin thus: —"The high-born, the rich, and the beautiful are peculiarly exposed to flattery. Their favours are eagerly sought by multitudes, and every stratagem is employed to attain them. The sweet incense is, therefore, offered in abundance, and is eagerly inhaled, till the victims intoxicated by the fumes;" &c. In this strain, or something like it, let us carry out the former of the two purposes. The development of thought being, as to this point, sufficiently extended, let the development as to the next point, have also its appropriate paragraph, beginning perhaps thus:—"But the flatterer is justly abhorred by all good men; for the art he uses is deceit and servility. To gain his own ends, he wears a constant mask, and belies the real sentiments of his breast. He offers what he knows must poison the mind; a worse effect than," &c.

Example 3. "We may therefore come to these conclusions, —that perfect bliss is not to be found in this life; that our felicity consists in the pursuit, much more than in the attainment of our wishes; and that happiness without alloy is reserved for another state of being: *as the most fortunate of men, when they have reached all they once desired, are still in want of something to complete their happiness.*"

If the reasoner had previously stated arguments sufficient

to infer the conclusions, the after-thought in italics is out of place. It is either superfluous; or it ought to have been brought forward among the previous arguments.

*It belongs to rhetoric to bring forward arguments in such order, and with such outward admonitions of order, as may best fit them for reception, and clear understanding, as regards the persons addressed. In logic, *that* is the best order, which the reasoner finds most effectual for the clear development of his *own* knowledge to *himself*. What this may be, depends upon his habits of thinking. Some order he must have, or the development of his knowledge will be confused and valueless. He must fix points for development; and each of these being pursued to a satisfactory extent, he must then bring them all to issue in some one general result, which, during the progress of each, he has kept steadily in view. A reasoner whose exercises in logic are thus conducted, will, when he is required to be a rhetorician, find little difficulty in dividing an extensive discourse into parts subordinate and principal, whatever be the names he chooses to employ, sections, chapters, books, &c.; or other names, or external indications of division without formal names,—he may choose to employ. To interfere, by express directions, with this liberty of choice, would be, to curb originality in the conduct of thought; and to attempt to teach those who have no originality, would be, to show how fields may be divided, which produce no fruit worthy of division.—Our next general head, *Ignoratio elenchi*, will add something to the instruction which the present head proposed.

Errors in detail which come under the general head of Disjointed Reasoning.

18. Omitting necessary propositions. This is one of the forms of *ignoratio elenchi;* a phrase which may mean, having no proposition in view which the arguments in progress are intended to establish; or forgetting the proposition which has been laid down to be established. Both of these are the errors of a learner who has collected his knowledge by efforts of memory, and can perhaps clearly recover it in parts as his memory happens to serve him; but who has never

* See the second foot note, page 180.

meditated on his knowledge, so as to make it completely his own. Knowledge, in all cases, is the apprehension of relations; but these relations are separately innumerable; and many of them may, in their separate state, exist clearly in a mind of inferior power or industry. To collect them under higher and higher relations, is the effect of what we call *thinking;* a process which brings the separate relations under higher ones that include them. There are no limits to this process; and once begun, we may hope it will continue. All that can be proposed in a work of instruction like this, is to indicate the ordinary modes of failure, one of which is specified by the present title. An example is afforded by the following extract from a learner's theme, in which several propositions are required to make the train of thinking clear.

"The treasures of wisdom, like the precious ores, lie not on the surface to be picked up by the casual traveller, but must be sought for with pains and labour. Books and teachers may show how and where the treasure is to be sought, but it can be gained for us by none other than ourselves,—by our own perseverance, our own patient examination, our own frequent reflection. If the limbs were muffled up, they would soon lose their strength: and so the faculties of the mind, if not employed, and directed to the acquisition and arrangement of knowledge, will fail in their natural acuteness, and become incapable of any steady and useful effort. In solitude we may learn with what wisdom the Creator has fashioned even the least of his works:—in society we may observe characters and manners, and grow wise in the knowledge of mankind."

The correction of the example will show the importance of attending to the caution which heads the present section. (Title:) "On Study."—(First division or paragraph:) "*Knowledge cannot be obtained without study.* The treasures of wisdom, like the precious ores, lie not on the surface to be picked up by the casual traveller, but must be sought for with pains and labour. *And the labour must be our own: we cannot here enjoy the profit while others have the toil.* Books and teachers may show how and where the treasure is to be sought, but it can be gained for us by none other than ourselves,—by our own perseverance, our own patient examination, our own frequent reflection."—(Second paragraph:)

"*Let us further observe that study is as necessary to the mind as action is to the body.* If the limbs were muffled up, they would soon lose their strength: and so the faculties of the mind, if not employed, and directed to the acquisition and arrangement of knowledge, will fail in their natural acuteness, and become incapable of any steady and useful effort."—(Third paragraph:) "*Nor is it in books alone that we may find the means and opportunity of study.* In solitude we may learn with what wisdom the Creator has fashioned even the least of his works:—in society we may observe characters and manners, and grow wise in the knowledge of mankind."

It may be necessary to add, that the divisions or paragraphs require not to be named, if the manuscript distinguishes them in the usual way; and that italics are used above only to call attention to the propositions which are supplied.

19. PROPOSING TOO MUCH OR TOO LITTLE. A proposition ought not to contain more than the arguments are intended to prove; since, in the mind of the reasoner, it is, or ought to be, the conclusion from those arguments. Suppose, for instance, that the theme-writer intends, in one division of his exercise on Astronomy, to dwell upon the sublimity of its objects, he ought not, in that division, to say that "astronomy is a noble, an interesting, and a *useful* science," but only say that "it is sublime, noble, and interesting." Yet the omission of the word *useful*, would be a fault at the commencement of the theme, in proposing *all* the points which the reasoner intends to consider; since the *utility* of the science, it is presumed, would be one of the points.

A writer should be careful of even seeming to promise too much; and therefore, in a theme, all high sounding transitions or introductions should be avoided. Suppose, for instance, that the theme-writer, after dwelling on the sublimity of Astronomy, were to proceed thus:

"Having thus described and illustrated, to the best of my ability, the sublime thoughts, and correspondent emotions, to which the noble science of astronomy gives birth, I shall now proceed to show, that this branch of study is not less useful to man, than it is sublime and interesting."

This would be a transition of disproportionate length to suit a brief theme. The writer needs only say, "But the

study of astronomy is as useful as it is sublime;" and then proceed to show its uses.

20. DEVIATION FROM THE PROPOSITION. This fault occurs when the reasoner lays down a proposition, which he follows up by arguments that do not especially belong to it, but to some other proposition, which embraces both the first proposition, and the others. His reasoning, therefore, may not be wrong, if referred to something in his mind which he leaves unexpressed, but is irrelevant with regard to the proposition with which he starts: for example:

"Anger has been called a short madness; and people of the weakest understandings are most subject to it. It is remarkable that when a disputant is in the wrong, he tries to make up in violence, what he wants in argument. This arises from his pride. He will not own his error; and because he is determined not to be convicted of it, he falls into a passion."

There may be truth in all that is here said, but it is not truth to the purpose,—at least, if the commencing proposition is meant to indicate the purpose. To follow up that purpose, the reasoner should have proceeded in the following manner, or in some manner like the following:

"Anger has been called a short madness. To be convinced that the appellation is just, let us look to the effects of anger. It disturbs a man's judgement, so that he inflicts an injury on his dearest friend, whom, the next moment, he loads with caresses. It makes him run headlong into dangers, which, if his mind were clear, he would be the first to see and avoid. It is true that anger does not always disturb the mind to this degree; but that it disturbs the mind to a degree proportionate to its violence, is certain; and, therefore, it may be justly denominated a madness."

21. DISCOURSING SHORT OF THE PROPOSITION. This fault arises from regarding a subject in some partial point of view which happens to be familiar to the reasoner, instead of regarding it in the extent implied by the term or terms proposing it. Suppose, for instance, that *Education* is the subject proposed to be developed, and that the reasoner is a young female;—she would ill suit the arguments to so general a subject, although she would correctly proceed according to her limited experience, if she began thus:

"My opinion of education is this, that reading, writing, and arithmetic, are the groundwork, and that English grammar comes next in importance. A child ought to begin French very early, because the pronunciation of that language is difficult in maturer years. I would also recommend attention to the accomplishments of dancing, drawing, and music; and, above all, I would not have needle-work neglected."

It is evident that such a detail does not meet the subject in the universal sense in which it is proposed. But how can we expect, from a reasoner, the development of more knowledge than experience has provided? Yet it may be useful to point out, to such a reasoner, that if the subject is proposed in its widest sense, the arguments should be equally comprehensive: for instance:

"My opinion of education is this, that it is then only just, when it fits the individual for his duties. For this purpose, both the mind and the body stand in need of discipline. The mind must be made acquainted with the duties of life, and instructed in all science necessary to their performance; and the body must be formed to whatever habits will most effectually conduce to the same end."

All this is applicable, whether we speak of a male or a female, a prince or a peasant, a member of civilized society, or a savage who lives by hunting and fishing; and the arguments, as to their extent, therefore agree with the proposition. Yet a writer is not bound to treat a subject thus generally: he may choose a special view, because he feels competent to no other. All that is required, in such case, is a statement, at the beginning, of what he intends—a proposition which limits the general subject, and saves the arguments from the charge of irrelevancy. Thus, the female reasoner in the example furnished above, would have been free from censure, had she begun thus:

"Of education, generally, I am incompetent to speak. I can but point out, from the experience I have had, what I think necessary to be taught to young females, raised, in our country, above the necessity of manual labour. They must learn reading, writing, and arithmetic; and English grammar comes next in importance. A child ought," &c.

22. DISCOURSING WIDE OF THE PROPOSITION. This fault arises from an indistinct view of the subject. Hence the

writer, instead of using arguments which agree with the proposition, and with nothing else, employs such as agree with some general proposition under which the particular one is included: he may be compared to a person that shoots toward the mark, but does not take aim precisely at it.

Example 1. "Prudence is a sure road to reputation. They who are obedient to their parents and teachers when young, obtain accomplishments which are of the highest value in maturity. As they advance in years, they fear God, honour the king, and do as they would be done by. By this manner of conduct, they may sometimes miss immediate advantages, such as short-sighted, cunning people would snatch at; but they gain what is much better, the approbation of their own hearts, and, finally, the respect and applause of mankind."

These arguments do not belong to *prudence* in particular, but to *virtue* in general, and would accordingly be suitable to this proposition,—"Virtue is the surest road to reputation. They who are obedient," &c. Arguments suitable to the other proposition, will be such as these:

"Prudence is a sure road to reputation. A man whose abilities are of a common, or even of an inferior order, but who determines cautiously, and chooses the proper time for all he says and does, will advance with certainty, though perhaps slowly. The chief cause of his progress will be, the confidence he secures: for all feel the value of *his* advice, assistance, and agency, who knows exactly when to speak, and when to be silent, when to act, and when to cease from action."

Example 2. "Disappointments are a great part of our portion in this life. In our infancy we are liable to dreadful accidents, and must trust entirely to others for safety and preservation. As we grow older, we think we can take care of ourselves, and we become confident and presuming. But almost every day brings with it some greater or less misfortune, and thus we are gradually taught not to depend entirely upon ourselves, but to put our chief trust in God."

To keep to the point, the reasoner should have proceeded thus: "Disappointments are a great part of our portion in this life. The wishes and hopes even of our childhood are as frequently checked as gratified; but this may seem inevitable, because we have not yet acquired sufficient experience to

form proper expectations. As we grow older, we think our better judgement enables us to calculate less erroneously, and we become confident," &c.

An indistinct view of a subject is often betrayed by a single expression. Suppose the theme-writer is treating of *melancholy;*—in urging the duty of not giving way to it, he should not say, "We are bound to bear the evils of life with *patience*," but "with *cheerful resignation*." On the other hand, if he is treating of *fretfulness*, he ought to argue that we are bound to bear the afflictions of life with *patience*.

CHAPTER VI.

THE SYLLOGISM OF FORMAL LOGIC.

1. We deem some account of this syllogism to be expedient, not because it can be of the least practical value to our student, but because the technical language pertaining to it, has, from time immemorial, been associated with the prevailing notions of logic, and we would not have our student quite ignorant of what, through the force of habit, is wont to be thought necessary in a work upon Logic. And that the account given for this purpose may be clearly understood in contradistinction to the doctrine held in this Manual, we shall conclude the chapter with a recapitulation of the leading principles of our doctrine.

Some Account of the Syllogism of Formal Logic.

2. The Syllogism which is worked by *extremes* and *middle term*, is constructed under a persuasion that the act of the intellect by which, from two things known, we reach a third, is a voluntary act; and that, in the deduction of our knowledge, real or assumed, we can, with relation to this knowledge, come to wrong *conclusions*, as, in the induction of it, we can wrongly apply what we know, to interpret what we do not yet know,—in other words, can make wrong *inferences*. The persuasion is completely erroneous; but it is one into which we almost inevitably fall, if we embrace the ordinary or vulgar notion of the way in which language is the exponent of thought. The syllogism of Aristotle is built upon the common notion: let us then see what this notion is.

3. The vulgar notion of thought expressed by language, is, that the one represents the other with a perfect correspondence of part to part, and a correspondence of operations in joining the parts. Acting on this notion, we shall, when we desire to ascertain what exists or what is going on within the mind, examine what exists outwardly, and how we operate with what so exists. Proceeding upon this principle, altogether a false one, we shall, in the first place, arrive at *ideas*, as the presumed mental originals of single words, and at an appropriate faculty of the mind, by which these ideas, primarily received into the mind from the things of sense, are revived by words; which faculty is called *simple apprehension*. But words, without being formed into sentences, can be joined by certain grammatical particles; and we must again look into the mind for the correspondent originals. Hence the division of *apprehension* into *complex* and *incomplex*, the latter being the apprehension of ideas signified by single words, the former by words united so as not to be sentences. The next operation of language is the joining of words into sentences. This is done by verbs. But verbs are many, while the effect of a verb is always the same. We have therefore to find a verb, which shall produce this common effect, without embarrassing the outward operation with more than it produces. Such a verb is found in what is called the copula, *is*. This verb, placed between the signs of two ideas, is supposed to indicate another operation of the mind called *Judgement*; for, admitting that the one idea agrees with the other, the judgement pronounces that they do agree, and the verb *is* presents itself as the sign of that verdict. But they may not agree; and we have further to find, in the outward operation, a sign correspondent to the opposite determination of the judgement; which, if found, we are to take as an evidence of a correspondent mental act. The sign required is found in the grammatical term *not* or *no*.—Advancing now from words formed into sentences, to sentences formed into discourse, we have again to ascertain, from the outward act, the (presumed) correspondent mental operation. Why should propositions which the judgement pronounces to be true, because it has compared the ideas in each, and affirmed or denied that they agree,—why should these necessitate another proposition which is true because the others are true? This is the problem which the syllogism

undertakes to solve, and in taking up this problem, we enter upon a third operation of the mind, called *Reasoning*.

4. To solve this problem in the Aristotelian way, we must suppose that, in innumerable cases, the judgement is unable to pronounce, of two ideas, either that they agree or disagree. In this difficulty, the reason comes forward, and provides a third idea by which to measure these two. What really does take place in every act of the intellect, here comes in to give plausibility to the Aristotelian doctrine, namely, the occurrence of premises, which are always two, and the inevitable intellection from them.* But in the doctrine of the syllogism this is proposed to be accounted for, not as an inevitable, but a voluntary act. We have to prove that two ideas agree or disagree, when the judgement cannot pronounce that they do so; and, as above-said, reason is supposed to provide us with a third idea. With this idea each of the two ideas is measured, and if each idea agrees with the third, then Reason determines that they agree with each other; but if either of them disagrees with the third idea, then it determines that the two disagree. The mental process here described, if manifested with accurate correspondence outwardly, requires three propositions, two in which the ideas whose agreement or disagreement is sought to be proved, are severally measured with the idea signified by the middle term; and one in which, consequently upon the two-fold comparison, the two extremes, as they are called, receive from this reasoning process, the judgement of agreement or disagreement. It is, of course, admitted by the Aristotelians, that sentences united into dis-

* The doctrine of the Aristotelian syllogism has the effect of the juggler's art, who talks to his audience of something which he seems to be doing, yet is not doing, in order to call off their attention from his real proceeding: the difference is, that the ordinary juggler does not deceive himself, and the Aristotelian does. Dugald Stewart indeed intimates that the prime juggler knew what he was about; but this is hardly credible; and with regard to his followers, nothing can be more conscientious than their belief in the truth of what they teach: see, for instance, Dr. Whately, *passim*. The fact is, that they feel the true ground of the syllogism even while describing the false one. And so capital is the trick, that Locke and others, though they see it must be a trick, are not able to describe how it is done. Locke merely says, with characteristic simplicity and plain English sense, "God hath not been so sparing to men to make them barely two-legged creatures, and left it to Aristotle to make them rational. He hath been more bountiful to mankind than so."

course do not always appear in the forms of syllogism; but it is insisted upon, that *their* syllogism, namely, the syllogism which works by extremes and middle term, lies concealed under every operation of language transcending the representation of ideas by single terms,—the representation of ideas by terms joined by particles not being verbs,—and the junction of terms by means of a verb into a sentence; which last mentioned fact yields what they call a proposition in outward form, and a judgement when spoken of as the correspondent operation in the mind. But this is not the whole of the matter: The doctrine thus briefly described, carries with it much other doctrine, both in the preliminary stages, and in the syllogism which results from them. First, for ideas, we have the doctrine of the *Categories* or *Predicaments*, which are ten in number; *Substance*, *Quantity*, *Quality*, *Relation*, *Place*, *Time*, *Situation*, *Possession*, *Action*, *Suffering*. These are presumed to contain, as *summa genera*, all our ideas; in other words, all the subject-matter of judgement and predication. Passing to the next stage, that is to the operations of the Judgement upon these materials, we have a division into *subject* and *predicate*, the term expressing an idea concerning which a judgement is to take place being called *a subject*,—the term expressing the idea affirmed or denied to agree with it, being called *a predicate*. Hence, ideas and their correspondent terms, when they are to be predicated, are called *predicables;* and the doctrine is, that they can be predicated as *genus*, or as *species*, or as *difference*, or as a *property*, or as an *accident*. Thus *animal*, which belongs to the category substance, can be predicated as *genus* of the subject, man; (also belonging to the category, substance). Thus *rational*, belonging to the category quality, can also, as a *difference*, be predicated of the subject, man. Thus again *rational animal*, now again belonging to the category substance, can be predicated, as his *species*, of the subject, man,—the difference and the added genus making up the species. Thus, once more, *risibility*, which belongs to the category quality, can be predicated as a *property* of the subject, man. And thus, lastly, being *young* or *old*, *tall* or *short*, *rich* or *poor*, *digging in his garden*, or *asleep in his bed*, and so forth, can be predicated as an *accident* of the subject, man. Such doctrine under the first and second of the assumed three operations of the mind, fur-

nishes the ground for constructing the formal syllogism; by which, as already said, when the judgement cannot pronounce on the agreement or disagreement of two ideas, it is proposed to *demonstrate* their agreement through the instrumentality of a third idea. To a demonstration an axiom is necessary; and the axiom of the formal syllogism is the *dictum de omni et nullo;* whose purport is, that *whatever is affirmed or denied of all the members of a class, may be affirmed or denied of every member of it;*—where, be it observed, the word *all* is required to be understood distributively, and not collectively; so that a less equivocal statement of the axiom is this—*Whatever is affirmed or denied of every member of a class, is affirmed or denied of every member of it;* as pure an axiom, no doubt, as another often referred to, namely, *Whatever is, is.* In our logic, we call this an identical proposition, and consider it to be verbiage. But let us accept them both as axioms, and pass on to other doctrine necessary to the construction of the formal Syllogism. The terms expressing the ideas whose agreement or disagreement is to be demonstrated, are to be received under the names of *minor*, and of *major* term, the former being the subject, the other the predicate; as, for instance, in saying *Kings are mortal*, *Kings* is the minor, and *mortal* the major term. Then we have a difference of propositions with regard to their *quality*, and to their *quantity;* a proposition which *affirms* the agreement of the two ideas being said to differ in *quality* from one which *denies* their agreement; and a proposition which affirms or denies *universally* of a class of things, being said to differ in *quantity* (and this is, of course, a difference in *our* logic also,) from one which affirms or denies only concerning *some* of a class; for instance, it is one thing to say, "All your servants are rogues;" and another to say, "Some of them are rogues," or "Some one is a rogue." Another necessary doctrine towards the construction of the formal syllogism, is that of the *distribution* or *non-distribution* of terms. The purport of this may be indicated by an example. If we say that "Every mare is a horse," it does not follow that "Every horse is a mare:" but if we say that "No goose is a swan," it does follow that "No swan is a goose." Accordingly, it is one of the principles in the doctrine of the formal syllogism that the minor term of an affirmative proposition is *distributed*, that is, it in-

cludes all that it can be applied to; while the major term is *undistributed*, that is, it does not include all the things it can be applied to; as, for instance, in saying "Every mare is a horse," the term *horse* understood only of those horses that are mares, does not include all that the term *horse* can be applied to: but with regard to a negative proposition, both the major and the minor terms are distributed. And now with the apparatus of the syllogism, and its doctrine in hand, let us proceed with the demonstration it proposes. When we have to show, on the principles of the science, that two ideas agree or disagree, we must hunt among the categories for a suitable third or middle term, with which to compare, first the major, and then the minor term:—the proposition arising out of the comparison of the middle with the major term, is then called the *major premise*; and that arising out of the comparison of the middle with the minor term is called the *minor premise*. If, in these two acts of comparison, the *judgement* determines an agreement between the major term and the middle,—and again between the minor term and the middle,—then *reason* comes in, and affirms, in what is called the conclusion, the agreement which was to be demonstrated between the terms that have been thus measured with the middle term:—but if the *judgement* determines, in its two acts of comparison, that either the major or the minor term, does not agree with the middle term, then *reason* determines, in the conclusion, what, as an alternative, was to be demonstrated, namely, the disagreement of the terms that have been measured with the middle term; in other words, that the major of the conclusion must be predicated negatively of the minor. But the conclusion arrived at through this process, cannot, after all, be depended upon, except under the safeguard of laws growing out of the doctrine of the quality and quantity of propositions, and the distribution or non-distribution of terms. Thus, for instance, we are required to distribute the middle term once at least in the premises; a failure in which, is called an *undistributed middle*. Thus, also, we are required to distribute the major or the minor term in the premises, if we propose to distribute it in the conclusion; a failure in which, is called an *illicit process of the major* or *of the minor*:—either of which failures vitiates the demonstration. Prepared, in this manner, to distinguish between a legitimate and an illegitimate

syllogism, we come next to consider in how many ways three propositions can be constructed out of *extremes*, that is, out of the minor and major terms which are to form a conclusion when we reach it, and the *middle term* by which we propose to reach it. Now, disregarding the laws concerning the quality and quantity of propositions, which laws determine what forms are to be accepted as legitimate syllogisms, and what are not, we have no fewer than 256 of these triads of propositions, out of which, only 19, by virtue of the laws referred to, will be legitimate syllogisms; that is, syllogisms, which the dictum of Aristotle, referred to as their axiom, will be found to warrant. To make this understood by *our* scholar, the technical expedients in the doctrine of the formal syllogism, depending on the quality and quantity of propositions, and the relative situation of the three terms in the premises of a syllogism, must be further explained.

5. Propositions, in the doctrine of formal logic, are of four kinds; 1. Universal affirmative, signified by the letter A; as, "Every man is mortal;" "Every mare is a horse:" Universal negative, signified by the letter E; as, "No man is sinless;" "No goose is a swan:" Particular affirmative, signified by the letter I; as, "Some men are rogues:" Particular negative, signified by the letter O; as, "Some men are not rogues." These varieties of quality and quantity in the propositions, produce, when the propositions are formed into syllogisms, what are called the different *moods* of the syllogisms. Now the four symbols, A, E, I, O, and consequently the sorts of propositions that answer to them, can be varied by threes in 64 ways, so that we have 64 triads of propositions without any change of the relative situation of major, minor, and middle terms in each triad; which situation is this, that the middle term is subjected in the major premise, and predicated in the minor one; and, of course, the minor term, by its name, (see the previous section) is the subject of the conclusion, as the major term is its predicate. When, in forming a syllogism, the three terms are thus disposed relatively to each other, the syllogism is said to be in the *first figure*. There are three other figures. In what is called the *second figure*, the middle term is predicated in both premises; in what is called the *third figure*, it is subjected in both premises; in what is called the *fourth figure*, it is predicated in the major premise, and subjected in

the minor. And as in the first figure, we can have 64 triads of propositions, making up apparent syllogisms of so many different moods, we can, in all the figures, have four times 64, that is, as already stated, 256. But the laws of the syllogism exclude in the first figure all but four moods, A A A; E A E; A I I; and E I O: in the second figure all but four, E A E; A E E; E I O; and A O O: in the third figure, all but six, A A I; I A I; A I I; E A O; O A O; and E I O: and in the fourth figure, all but five, A A I; A E E; I A I; E A O; and E I O:—thus leaving, as above stated, out of 256, only 19 forms which are legitimate syllogisms; that is, which afford the demonstration proposed by the science.

6. In order that the nineteen legitimate forms of syllogism may be remembered by appropriate names, the symbolic letters of each are formed with consonants into words, otherwise meaningless,* and the words are put together so as to exhibit the following imitation of Latin verse:

Fig. 1. BARBARA, CELARENT, DARII, FERIOque prioris.

Fig. 2. CESARE, CAMESTRES, FESTINO, BAROKO, secundæ.

Fig. 3. TERTIA, DARAPTI, DISAMIS, DATISI, FELAPTON, BOKARDO, FERISO, habet: quarta insuper addit

Fig. 4. BRAMANTIP, CAMENES, DIMARIS, FESAPO, FRESISON.

Hence, for example, to say of a syllogism that it is in *barbara*, is to say that it is in the first figure, with a universal affirmative conclusion arising out of universal affirmative premises:† to say that it is in *camestres*, is to say that it is in the second figure, with a universal negative conclusion arising out of a universal affirmative major premise, and a universal negative minor premise:‡ to say that it is in *fresison*, is to say that it is in the fourth figure, with a particular negative conclusion arising out of a universal negative major premise, and a particular affirmative minor premise.§—It is to be

* There is a significant purpose in the added consonants, relating to the conversion of syllogisms; but considering the whole business to be mere trifling, we may be excused from a further detail.

† As, "Every man is mortal; every king is a man; therefore every king," &c.

‡ As, "Every true philosopher is one who counts virtue a good in itself; no advocate of pleasure is one who accounts, &c., therefore, no advocate of pleasure is a true philosopher."

§ As, "No fools are thoughtful; some men are thoughtful; therefore, some men are not fools."

remarked, before leaving this account of the formal syllogism, that a syllogism in any of the last three figures, can, under the safeguard of certain rules, be converted into a syllogism of the first, which is deemed the only perfect figure. For instance, the syllogism in the fourth figure exemplified in the third note below, can be converted into *Ferio;* as, "Thoughtful men are not fools: Some men are thoughtful: Therefore, some men are not fools." The fourth figure does not appear in Aristotle, but was added by his followers.

Recapitulation of the Leading Principles in this Manual of Logic; as opposed to the Principles on which (as explained in the foregoing Account) the Syllogism of Formal Logic is based.

7. In our logic, we presume not to inquire, much less to demonstrate, how or why an intellection takes place. We esteem it a fact, which can no more be accounted for than the fact of a sensation; though we estimate these facts as things in their nature different: we deem, for instance, that a sensation is one thing, and that the knowledge of a sensation, the result of intellection, is another.

8. We deny that, in using words for logical purposes, *three* operations of the mind are concerned. We affirm that the operation is always the same, however it may be signified outwardly,—that is, whether by single terms, or by complex terms, or by propositions, or by propositions united into forms of greater extent and complexity. We affirm, in short, that the difference between terms, and proposition, and syllogism, is a mere grammatical difference, having no foundation in any correspondent original processes of the mind, but being means sometimes convenient in one shape, sometimes in another, for fixing, or for developing the knowledge we have acquired, or for presenting it to another mind. For, in our doctrine, a single term, quite as much as a proposition, and quite as much as a syllogism, is an indication of knowledge arising out of premises. Thus *red* expresses our knowledge of a colour; which knowledge is the fact of our being aware of one sensation relatively to others of its kind; that is to say, we know what is red, because we know what it is not to be red; nor could we know the one, unless at the same time we knew

the other. That of which we have knowledge, and that by which we know it, are the premises,—the consequent knowledge is the conclusion expressed by this term. In a proposition, there is the same fact, with this only difference, that the premises are indicated as well as the resulting knowledge, though not indicated so distinctly as by the syllogism. In this last, the two premises and the conclusion are stated in so many sentences of independent grammatical construction; and the syllogism is therefore the most explicit form in which we can lay down what at any moment we know.

9. But in speaking thus of the syllogism, we do not mean the syllogism which operates by extremes and middle term, under the doctrine of affirmation and negation. With us, affirmation and negation belong to Grammar, not to Logic. *No man*, and *every man*, are equally signs of positive knowledge, in the one case arising out of the premises *no* and *man*, in the other out of the premises *every* and *man*. The same may be said of the knowledge expressed by *is-not*: it is positive knowledge, quite as much as that expressed by *is*. In all cases the resulting expression is one expression with one meaning:—Such is the datum of our syllogism, such the related argument. But these are no sooner expressed than the conclusion unites them and makes them one; so that now the whole syllogism is one expression with one meaning,—an expression of the knowledge attained or developed; just as a single term is such an expression; just as a complex term is such an expression; just as a proposition is such an expression.

10. With regard to the Categories, the GENERAL HEADS of all we know, they seem at present to have lost their reputation even with the Aristotelians themselves.* We may indeed fairly ask why they are so many, or why they are not more. As to one of them, RELATION, we affirm this to be included in all the others. A *substance*, whatever it be, is known, because we are aware of its *relation* to other substances; so of a *quality;* so of each of the other heads. We ask also, as to these general heads, or the special heads under them, or the singulars under these,—what is meant by calling them *ideas*. If by ideas is meant the *knowledge* which they signify,

* "The catalogue certainly is but a very crude one." Whately's Logic, Book IV. ch. II. § 1 (a foot note).

our only objection to the word is, that custom has rendered it, for this meaning, a vague and indistinct expression:—if other is meant than knowledge of the things to which the term can be applied, we object to its application in this way, till it can be shown what it is that words can signify other than things real, things ideal, (both of which come under the common term of things physical,) and things metaphysical: the words in all three cases being *immediately* significant of knowledge, which, in its nature, is distinct from the things comprehended by it; that is to say, words are, in all cases, immediately significant of what is metaphysical, but can next be applied as names to things real, or to things ideal, or to things which are neither the one nor the other, but are the relations under which those things suggest themselves to the human understanding, which relations we have the power to entertain apart from the things.

11. The science of the formal syllogism proposes a demonstration of its conclusions. Our doctrine is, that we cannot come to a false conclusion in deductive reasoning except by depending on the forms which that syllogism provides, and then neglecting its rules. The science, then, is necessary only to those who use its forms: to propose it for others, is to propose spectacles for people who, without them, cannot but see clearly, or crutches for people who, without them, cannot but walk well. The use of the syllogism in our logic, is, not to test the validity of conclusions, but to spread out our premises, that so we may be induced to consider on what grounds we have assumed them. In a word, our logic leads us always back to what we have acquired, or what we presume we have acquired, in order that, if our knowledge is not sound, we may supply its deficiencies, or set it altogether aside.

APPENDIX.

OUTLINE OF AN INTRODUCTORY COURSE OF INSTRUCTION IN LOGIC;

FOR PUPILS NOT YET COMPETENT TO ENTER ON THE STUDY OF THE WHOLE WORK.

In order to feel what he can, and what he cannot accomplish in developing his knowledge, the learner should at once be set to theme-writing.* All the instructions immediately required for this purpose will be found between Section 42, Chapter IV., and Section 4, Chapter V., both sections inclusive (pages 171–187). This having been diligently read and well considered, let a subject be chosen either from among those suggested, or from such as may occur in reading or in conversation. Say, that *Curiosity* is the subject chosen. It is most likely that his first thoughts will perplex and confuse him. He will be disposed to consider curiosity only as a mischief, an impertinence, a meanness, because his attention has been most frequently called to these effects; and yet he will suspect that some higher point of view should be taken, which may discover the good, as well as the bad effects of curiosity. A definition will here be needed,—"Curiosity, or eagerness of search after knowledge, is"—what? Let him reflect for a time, and he cannot fail to add something to the following purpose:—"either a good or an evil, according to the purposes to which it is applied." The subject thus branches into two, and his subsequent development will bring forth what his experience and reading make him know, first, of well-directed curiosity, and then of curiosity idly and impertinently directed.

It is not always necessary to begin by a definition. If the name of the subject is at once suggestive of all that it includes,

* We are here supposing the pupil to have passed through the Exercises pertaining to Grammar and to Rhetoric.

it will be best to begin, not by a definition, but by some very general proposition. In treating of *Industry*, for instance, it would be an obvious thing to say, that "It is the source of all the blessings of life." Having stated this general fact, which is to be developed by particulars, it is very likely that the young thinker will find himself lost amid the multitude that crowd into his mind. He is conscious that it will not do to note them down in heterogeneous order, just as they happen to occur, as in making out a catalogue:—how, then, must he proceed?—He must adopt some general heads, standing, as it were, midway between the first general statement, and the infinite particulars which still lie beneath:—for instance, he might go on to say, "First, let us see what industry does for the poor man:" and having developed his knowledge under this head, the following might be another: "Next, let us see what industry does for the young, and consequently ignorant person." Other heads might be, the effects of industry on sterile land, or on land partially covered by sea; on the people of a whole country; on the arts which refine a people; and on the sciences which improve those arts. His mode of developing this subject would be a guide in developing the opposite,—*on Sloth*, of which subject, the following is an outline for his guidance; and to it are added a few other outlines, after filling up which, it is hoped that further assistance of the same kind may be discontinued.

On Sloth. 1. It is the root of all evil: what condition it brings even a rich man to. 2. What it prevents in the young. 3. What will be the character and condition of a once flourishing farm after years of neglect by a slothful owner. 4. What effect sloth produces, or is likely to produce on a whole people. 5. What effect it has upon the bodily health. 6. What effect on the mind and morals.

On Enthusiasm. Ardour of mind engendered by something that affects the imagination: may be an evil;—may be a good. 2. An evil whenever it operates against reason—for instance, in certain enterprises; in the religious temper of the mind; in the reception of new opinions. 3. A good, when it is controlled by reason—for instance, in our enterprises, in our religious feelings, in our opinions. 4. It ministers to excellence in the fine arts; it confers the capacity for appreciating and enjoying them.

On Good Temper. A greater good than any other personal endowment, or other gift of Providence. For every thing is valuable in proportion to the happiness it secures. Now a good temper, &c. A good temper may be the gift of nature, but it may also be the growth of reason and habit. For let a person be convinced, &c., and let him day by day, nay, hour by hour, watch and control, &c.

On Happiness. 1. Is the great object of all our actions: the ways are different:—this man imagines it is to be found in, &c.; another in, &c.; a third in, &c. Some suppose, &c., others, &c.—But though the ways are thus different, the end is ever the same, namely, &c. 2. The greater number of these supposed ways must be wrong; for the greater number of those who follow them confess that, in their several pursuits, they never reach their object. 3. Happiness exists in the mind, and only to a certain extent is it dependent on external circumstances. 4. What the circumstances are, both external and internal, on which happiness depends.

On Liberty. 1. A subject that seldom fails to raise our warmest emotions: we think of the heroes of Greece and of Rome, of Switzerland and of Britain:—say, who they were, and what they attempted. 2. Our love of liberty is justified by the evils that attend a state of slavery: develop these evils. 3. But liberty must not be confounded with licentiousness. Shew that wherever there is real liberty, there is subjection to authority, which controls the evil-intentioned, and protects the good.

On Self-knowledge. 1. All moral improvement depends upon it. If we know not our defects, we cannot, &c. 2. What are the hindrances to self-knowledge. 3. What will follow in proportion as we improve in it.

On Self-denial. 1. Consists in abstaining from some present gratification for the sake of greater expected good: is the great principle of religion, and of morals: of religion; for all the rewards which she holds out, are promised on the condition, &c.: of morals; for all the virtues imply that we resist, &c. 2. Self-denial is necessary, in a certain degree, to real enjoyment; for, &c.

On Obedience. Our progress in virtue, in knowledge, and in happiness, depends upon it: first in virtue; for we must conform to the laws, &c. 2. Secondly in knowledge; be-

cause we learn from others, either by teachers who communicate through the ear, or by books, which communicate through the eye; and if, &c. 3. Thirdly, in happiness; because we are prone to evil courses, in other words, to courses that end in misery, from which we can be preserved only, &c.

On Adversity. To creatures whose present existence is a state of trial, is calculated to be an ultimate good: first, by opening the heart to fellow feeling with the woes of others. 2. Secondly, by correcting vices engendered by prosperity, namely, &c. 3. Thirdly, by qualifying us to enjoy what is good, when the good returns; for he who knows not, &c., cannot truly know and enjoy, &c.

On Habit. 1. Is second nature: whatever is possible to be done, however difficult at first, is made easy by repeated trials, in other words by acquiring the habit: examples from the arts. 2. If it forms our practice in the mechanic and the ornamental arts, it has equal power in forming all our practice; hence our conduct in life will be dependent, &c. 3. However much we may wish to be good, yet if our habits, &c. On the other hand, our temptations to evil will be less strong, if our habits, &c.

On Order. 1. Is of the utmost importance in all the concerns of life. It conduces to comfort in a household; for, &c. 2. It is the source of internal prosperity and external strength in a nation; for, &c. 3. It is necessary in our studies, because in all things to be learned there is subordination of one part of knowledge to another; and if, &c. 4. It forms the virtues; for each virtue has its bounds as, for instance, &c.

On Time. 1. Is, with regard to every human being, the opportunity for accomplishing the great ends of his existence. These are, happiness here, and immortality hereafter. To secure happiness here, we must, &c. 2. To secure happiness hereafter, we must so rule our present conduct, as, &c. 3. The short period of the longest life, calls upon us, &c.

On Prejudice. 1. Is the habit or act of thinking and speaking, as if we had certain knowledge, when the subjects are such or so circumstanced, that we know either nothing about them, or very little. All persons are liable to prejudices, sometimes erring by being favourable, sometimes by being unfavourable:—for instance, when we see any one for

the first time, &c. So when we visit foreign countries, and see manners and customs different from our own, &c. Continue with other instances. 2. But though all persons are liable to prejudices, all persons are not governed by them. It is in this respect that people differ, and they differ greatly. One man is unconscious of his prejudices, and accordingly, &c. Another man is quite aware of the different character of his certain and uncertain knowledge, and therefore takes care, &c.

On Truth. 1 (see in the Index). 2. If we speak of Truth under three points of view, we may distinguish it as Moral, Scientific, and Divine. Moral truth is opposed to falsehood: it is the conformity of our words and actions to our thoughts. Thus we are said to speak the truth when, &c. In such a case, what we say may not be scientific truth, yet if, &c. 3. Scientific truth is that which we reach by study and experiment. Its amount will consequently be different at different periods of one's life, and at different periods of the world. Exemplify each observation. 4. Divine truth is that which belongs to the Deity, portions only of which He reveals to his creatures. Where do we find such revelation?

On Youth. 1. It is that part of life which presents the greatest number of enjoyments, the most important opportunities, the dangers most to be apprehended. 2. The enjoyments. 3. The opportunities. 4. The dangers.

On Age. 1. Though a state which we may not all attain, is one for which, throughout the previous parts of life, we should all make preparation. The nature of this preparation, that so, old age, if we reach it, may be happy. 2. The blessings of age when the proper preparation has been made.

On Solitude. 1. Is a state not meant for man, yet, as an occasional state, indispensable to the formation of some of the best qualities of our nature. Its likely effects on the understanding, and thence on the heart. 2. The unreasonableness of devoting life wholly to solitude.

On Society. 1. The nature of man is such as to demand society, both for the development of his powers, and for providing his true means of happiness. Prove these points. 2. How we may fail of these effects, though always in society.

On Geography. 1. Define it. 2. It must have begun by the knowledge of small tracts of the earth's surface:—

show in what way the knowledge must have increased,—travellers—commerce—inventions. 3. Its use in accompanying the study of history.

On Astronomy. 1. Define it. 2. The shepherds of Chaldea are the first recorded astronomers. Keeping watch over their flocks by night under a clear sky, they, &c. 3. What was the Ptolemaic system, and what is that which now has its place? 4. The kind of emotions which astronomical inquiries produce. 5. The practical benefits which the science yields.

On Agriculture. 1. One of the two primeval occupations of mankind—explain the fact. 2. All wise nations have held, and still hold, the cultivators of the land in high respect. Give proofs.

On Commerce. 1. Its necessity to the well-being and improvement of our race. Its simplest state. Indications, from history, of its early existence. 2. The states that, in modern times, have successively flourished by means of commerce.

On Morals and Manners. 1. These are not the same, though they are understood to imply each other, and though, to be perfect, they must go together. That they are not the same, is proved by the facts which we often witness, of a man sterling in morals without the recommendation of manners; and of one of superficially agreeable manners concealing the most corrupt morals. Explain the regret which accompanies our observation of either fact. 2. The union of morals and manners necessary to the perfection of both: there must be something deficient in morals themselves, if manners are wanting; and manners must often betray their flimsy character, if they do not rest on morals.

On Religion and Superstition. 1. Light and darkness are not more different than, &c., and yet, &c. Religion is the friend of man; Superstition, &c. Religion is clear-sighted, considerate, compassionate; Superstition, &c. Religion is full of hope, and rational though humble confidence; Superstition, &c. 2. The deficiencies through which Superstition gets possession of the mind, explained by the kind of persons in whom it is found, and the places where it most prevails. 3. The kind of persons in whom genuine religious feelings are observed, and the places where genuine religion is found.

*** *While the learner is prosecuting his practical exercises in logic, he should be required to study such parts of the Manual as will fit him to answer the following questions; reserving his study of the entire work for a more mature state of his undertaking.*

CHAPTER I.

Sect. 1, page 101. With what branches of learning is logic connected? In what different ways are the three branches you refer to, concerned with language? What is meant by the sense of a single word? What is meant by the sense of two or more words combined?

Sect. 2, ib. Explain the difference between induction and deduction.

Sect. 3, ib. Is there any difference between the grammatical and logical function of a word, and between logical and grammatical completeness?

Sect. 4, page 102. Who are they that learn and practise logic, both inductively and deductively?

CHAPTER II.

Sect. 11, page 113. What is the true process of inductive logic? What too often happens in this process? What is a powerful method of bringing a pupil to a consciousness of his deficiencies in the inductive process?

Sect. 12, ib. From what does all unrevealed knowledge originally spring? How are we led into the presumption that we can, of ourselves, know more than experience teaches?

Sect. 13, page 114. How are we preserved in the metaphysics of quantity (mathematics), from wandering among proofless abstractions?

Sect. 14, ib. How, in using words denoting things of sense, are we saved from inutility of thought?

Sect. 15, ib. In using the name of an abstraction,—say, *pride* instead of *proud*,—while we must apply *proud* to certain persons or certain acts, and we do not so apply the former word, we immediately mean by it nothing but the abstraction:—what have we in consequence to do? What is the the danger, ("Now the danger is," &c., page 15) when we

thus use a word to denote, not immediately, the things we know, but the form of thought under which we are *supposed* to include certain things which we know?

Sect. 16, page 115. In such phrases as the following, what have we to remember as essential differences:—*the pride of John, the brother of John; John's pride, John's brother: pride belonging to John, houses belonging to John; John possessing pride, John possessing houses?*

Sect. 17, page 116. If there is nothing within the reach of our human faculties to which a word is applicable, what interpretation should we give it?

Sect. 18, page 117. What have you to remark concerning knowledge, and the things that originally suggest it? What things exist as the subjects of thought, beside real things?

Sect. 19, ib. and 119. What are things ideal?

Sect. 20, page 118. What is a thing metaphysical? Give examples.

Sect. 21, ib. Of what things are words that are parts of speech the immediate signs? What differences of application are there among these words?

Sect. 22, ib. What is a proper name?—a common name?—a name abstract? How may a name abstract become a common name?

Sect. 23, page 119. Are not words very flexible—by which I mean liable to different extent of meaning? What three points are to be kept in mind relatively to what you have just admitted?

Sect. 24, ib. What is the etymological sense of a word? Give examples.

Sect. 25, ib. What is the general sense of a word? Give examples.

Sect. 26, page 120. What is the special sense of a word? Give examples.

Sect. 27, ib. In the use of signs to advance and fix knowledge, what operations occur?

Sect. 28, ib. What is abstraction? Give examples.

Sect. 29, ib. What is generalization? Give examples.

Sect. 30, ib. What is specialization? Give examples.

CHAPTER III.

Sect. 4, page 134. State the different kinds of definitions.

Sect. 5, ib. What is a Nominal definition? Give examples.

Sect. 6, page 135. What is a Real definition? Give examples.

Sect. 7, page 136. What is an Accidental definition? What is a Property? Explain what, in different cases, is an Accident in Logic.

Sect. 8, pages 137, 138. What is an Essential definition? Give examples. Into what two kinds does an essential definition divide? Give instances. Define *Pride*, so that you cannot speak of a proper pride: define it so that you can.

CHAPTER IV.

Sect. 1, page 140. What is Deductive logic?

Sect. 7, page 145. When we intend to develop our knowledge, what have we first to choose? What may be the different forms of titles?

Sect. 8, page 146. Suppose our subject is expressed by a single word, what is the first proof that can be given of the existence of the knowledge presumed to be included under such title? Are we always obliged to begin by a definition? Define some of the things you see around you.

Sect. 9, ib. Suppose a subject to be given out in such a form as the following—*On a Knowledge of the World*—is it more or less limited than if given out thus—*On Knowledge?* Are we tied, in the consideration of such subjects, to any definite number of points or purpose of development? Suppose our subject to be stated in the form of a proposition, as—*A proper knowledge of the world is favourable to virtue*,—will the plan of treatment be quite open to choice, as with subjects stated in the previous ways?

Sect. 10, page 147. What is an Argument? Give instances. What three things exist in every argument?

Sect. 11, ib. From how many sources do arguments take their technical names?

Sect. 12, (including title,) page 148. What are the names of External Arguments? Is not all our knowledge originally

suggested by things external? Then why do we call certain arguments internal?

150 (title.) Mention the names of internal arguments.

Sect. 13, ib. When are we said to reason from definition? Give instances.

Sect. 14, ib. When are we said to reason from Etymology? Give an instance.

Sect. 15, pages 151, 152. When are we said to reason from Enumeration? Give instances. What is the argument from enumeration sometimes confounded with? Give an instance of an inductive argument. How is the difference between an argument from Enumeration and from Induction done away with?

Sect. 16, pages 153, 154. When are we said to reason from the Genus? Give instances. What is left to the topic Species for its usual mode of proof? Give an instance.

Sect. 17, page 154. When are we said to reason from the Cause? Give instances. Give an example of what is called an Inference.

Sect. 18, page 155. When are we said to reason from the Effect? Give instances.

Sect. 19, pages 155, 156. What Latin phrases often occur in logic, implying the same as argument from cause, and argument from effect? How do you define *a-priori* reasoning? What is *a-posteriori* reasoning?

Sect. 20, p. 157. As every cause is an Antecedent, why do we not consider every antecedent to be a cause? Give an instance of an argument from antecedents.

Sect. 21, ib. As every effect is a consequent, why do we not consider every consequent to be an effect? Give an instance of an argument from consequents.

Sect. 22, page 158. When are we said to reason from the Adjuncts? Suppose we develop our knowledge of John by all that constitutes his history, why shall we be said to reason from the Adjuncts or Accidents of our subject? What did the ancients mean by Essence? What are Accidents? What are Properties?

Sect. 23, page 159. What general head of several topics have you now to mention? Give an instance of reasoning from Similitude;—from Analogy, or Parity of case;—from Contraries;—from Proportion. Page 160: When are we said to argue *a fortiori?* Give an instance.

Sect. 24, page 160. Explain the phrase *Cæteris paribus.* Explain *Mutatis mutandis.* Exemplify their use.

Sect. 25 (and Title), ib. What is the next source whence the names of arguments are derived? Page 161: What do you call the first two propositions of a syllogism when taken together? What are they called separately? Give an instance to show that it is sometimes indifferent which of the two premises we call the datum, and which the argument. What, for the most part, will be the premise to which the name datum will be properly applied?

Sect. 26, page 161. When are we said to use the *Argumentum ad judicium?*

Sect. 27, ib. When is it that, in reasoning to oneself, one may be said to use the *Argumentum ad hominem?*

Sect. 28, page 162. When are we said to use the *Argumentum ad doctrinam?* Give an instance.

Sect. 29, ib. When are we said to use the *Argumentum ad verecundiam?* Give an instance.

Sect. 30, ib. When are we said to use the *Argumentum ad fidem?* Exemplify your meaning.

Sect. 31, page 163. In what manner may a person wilfully go astray in his own thoughts? What expedient in rhetoric, will such error in logic correspond to? Give an example.

Sect. 32, ib. What error in one's own reasoning corresponds to what is called *Argumentum ad passiones?* Give an instance.

Sect. 33 (and Title), ib. What is the next source whence the names of arguments are derived? Does the reasoning process necessarily change with the changing forms of language? Page 164: Explain, as one instance for many, what it is to have the knowledge which the word *man* expresses. When we know *man* to be a rational animal, how may that knowledge be developed in a syllogism? Why may the syllogism be deemed the fundamental form of reasoning?

Sect. 34, page 165. Give instances to show that two words, properly put together, are tantamount to a syllogism. Page 166: What may be regarded as the original form of speech in which knowledge is developed in deductive logic?

Sect. 35, page 166. Give an instance of what you call the original form of speech, but so constructed that each of the two parts is made up of many subordinate parts, and these

again of others, till at length we reach the mere grammatical parts.

Sect. 36, page 167. Although the period constructed of noun and verb, is the original form of logical development, yet to what form do logicians more commonly refer all other forms?

Sect. 37, ib. What is an Enthymeme? Give instances.

Sect. 38, ib. What is a Sorites? Give an instance.

Sect. 39, page 168. Is Logic, or is Grammar, the department of learning concerned with the distinction of propositions as affirmative or as negative, as categorical or as hypothetical (or conditional)? Give instances of these different sorts of propositions.

Sect. 40, page 169. What is a Dilemma? Give instances of data which can be unfolded into syllogisms exemplifying the dilemma. Unfold the instances into syllogisms. Page 170: Give an instance of the method of reasoning called *Reductio ad absurdum.*

Sect. 41, page 170. What is an Epichirema? Give an instance of a syllogism which may be the foundation of an epichirema. I will now develop this syllogism so that it shall be an epichirema: what have I added to the datum? What to the argument? Page 171: In what brief manner would rhetoric lead you to say all this?

Sect. 42, page 171. In following out the exercises you will have to write, what are you cautioned against?

Sect. 43, ib. How is improvement in logic best promoted? What does the word *theme* properly mean? What may it also mean?

Sect. 44, ib. When the subject of a theme is expressed by a mere grammatical noun, what kind of thing, different at different times, may it be the name of? What, at different times, will the name itself be? Page 172: Give instances of what you state.

Sect. 45, page 172. Give a few instances of subjects which are things metaphysical under names abstract. In treating these, where may you find certain cautionary principles that you ought to keep in mind? Now say, how you would in general begin, and how proceed, in developing your knowledge on such subjects. Page 174: Give some other instances of subjects that are things metaphysical under names abstract. How would you in general begin, and how proceed, in treating these?

Sect. 46, page 175. What are internal, and what are external arguments, otherwise called? When a real or an ideal thing is given out for treatment, what makes a development of our knowledge difficult? Page 176: Suppose Socrates were given out for a theme, how should we treat it objectively? Under what implied title might we otherwise treat it?

Sect. 47, page 177. The title of a theme, you formerly told me, might be a mere grammatical noun-substantive, or a logical, that is, a constructed noun:—in what other way can a theme be given out? Page 179: Mention a few *theses*.

CHAPTER V.

Sect. 1, page 180. By what three ways will a theme-writer be liable to logical errors in his deductive practice?

Sect. 2, ib. What is Verbiage?

Sect. 3, page 182. What, when it becomes evident in language, does confused Reasoning arise from?

Sect. 4, page 184. What is Disjointed Reasoning?

Sect. 5, page 187. Under Verbiage, what are more special names for errors in logical deductive practice? What designations, still more special, come under Petitio-principii? What under Non-sequitur? What under Error in distinction or division? Under Confused reasoning, what are the special descriptions of faults? Under Disjointed reasoning, or Ignoratio elenchi, what are the special descriptions of faults?

Sect. 6, page 188. What is Begging the question? Give an instance. Correct the instance in different ways.

Sect. 7, page 189. What is an Identical proposition? Give instances.

Sect. 8, page 190. When you mean to give a verbal explanation of a word, is it a fault to use for the purpose another word having the same meaning? When will it be verbiage to do so? The following is given as an example of the fault of Explaining a thing by itself: "Justice regards both magistrates and private individuals: the former show themselves to be influenced by it when they make an equitable distribution of rewards and punishments; the latter, when they are sincere in their words, and just in their dealings." Correct the example.

Sect. 9, ib. When does the error of Reasoning in a circle, take place? Page 191. Give an obvious example.

Sect. 10, page 192. When are Premises irrelevant? Give an example.

Sect. 11, page 198. When you prove too little, what sort of logical fault must it be? Give an instance. In all cases of proving too little, what do you mentally supply? Page 199: Give an example of an inference, in contradistinction to a necessary conclusion, and let your inference have the utmost certainty that an inference can have. Give a further instance or two of the error of proving too little.

Sect. 12, page 200. Why will proving too much be a non-sequitur? Give an example. Correct the example. Page 201: In any case of proving too much, as in any of proving too little, an unwarranted datum is assumed; but what is the difference of the datum in the two cases? Give a further instance or two of the error of proving too much.

Sect. 13, page 202. What general form of verbiage do we next reach? What is the species you have here to speak of? Give instances of the fault. I will repeat your instances, and you must correct each instance as I go on.

Sect. 14, page 203. What is a cross division? Give instances. I will repeat your instances, and you must correct each as I go on.

Sect. 15 (and Title), page 204. What description of faults come now to be noticed? What is the particular sort you have here to speak of? Page 205: What will be the effect of saying other than we mean, even supposing we are not entirely misunderstood? Give instances. I will repeat your instances, and you must tell me, after each, what the reasoner truly means. Page 206: Is it a fault to use a sentence that can be understood in two ways? Give some further instances of sentences that do not clearly say what is meant. I will repeat your instances, and you must correct each as I go on; rendering meaning in two ways when you are not sure of the one intended.

Sect. 16, page 207. To what fault is that of *Not distinguishing different senses of the same word*, opposed? What might our present title be? Page 208: How far are we at present concerned with this fault? I will read, as an instance, the faulty passage, which runs thus: "To write well is an

accomplishment," &c. Now tell me in what way it is wrong. I will read the next example: "It is better to be sensible," &c. Tell me the faulty parts, and correct them.

Sect. 17, page 209. What are the means which grammar provides, for the clear development of thought by words? While grammar looks to accuracy in the outward structure of language, what is it that logic must care for? Give a rule concerning what a sentence should not be made to bear. I will read each of the three examples, and you must tell me, after each, the nature of the fault.

Sect. 18, page 211. What is the Latin term for the errors that come next under notice? What may the phrase mean? Describe the sort of learner who is especially liable to such errors as you mention. Page 212: What is the effect of what we call *thinking* upon the relations which constitute our knowledge? I will read you the example of part of a theme in which several propositious are required to make the train of thinking clear: "The treasures of wisdom," &c. Now tell me how you would correct this.

Sect. 19, page 213. What ought a proposition *not* to contain? Give an instance. In order to keep clear of even seeming to promise too much, what should the theme-writer avoid? I will read you the instance: "Having thus described and illustrated," &c. Now, correct it.

Sect. 20, page 214. When does the fault of *Deviating from the proposition* occur? I will read you the instance: "Anger has been called a short madness; and people," &c. Now describe how it is faulty.

Sect. 21, ib. What does the fault of *Discoursing short of the proposition* arise from? Page 215: Is a writer always bound to treat a subject in the general way in which it may be given out?

Sect. 22, page 215. What does the fault of *Discoursing wide of the proposition* arise from? Page 216: What person may a writer be compared to, who is guilty of the fault? I will read you the two examples of the fault, and you will say, after each, why it is wrong. Page 217: Give instances to show that an indistinct view of a subject may be betrayed by a single expression.

KEY

For Correcting, at Pages 203, 204, and 206, the Sentences Logically Defective.

Page 203.

This great politician desisted from his designs, when he found them impracticable.

He was of so high and independent a spirit, that he abhorred being in debt.

Though raised to an exalted station, he was a pattern of piety and virtue.

His end soon approached; and he died with great fortitude.

He was a man of so much pride, that he despised the sentiments of others.

Poverty induces dependence; and dependence increases corruption.

This man, on all occasions, treated his inferiors with great disdain.

There can be no order in the life of that man, who does not allot a due share of his time to retirement and reflection.

Such equivocal expressions, mark an intention to deceive.

His cheerful, happy temper, keeps up a kind of daylight in his mind, and fills it with a steady and perpetual serenity.

Page 204.

The things brought out to me, were some square, some round; some white, some blue, some red; some natural, some artificial.

He was a man of extensive riches, high birth, and exalted virtue; quick to discover fraud; very generous, and of great temperance.

In treating of poetry, I shall consider it under the heads of Epic, Lyric, and Dramatic; Ancient and Modern; Classical and English; Written-in-rhyme, and Written-in-blank-verse.

Men, as to constitution, temper, and habits, are phlegmatic, sanguine, or choleric; gay or gloomy; devoted to pleasure, or devoted to business.

Page 206.

The Romans shall, I say, subdue Pyrrhus. *Or*, Pyrrhus shall, I say, subdue the Romans.

The duke yet lives that shall depose Henry. *Or*, Henry shall depose the duke that yet lives.

The rising tomb bore a lofty column. *Or*, a lofty column bore the rising tomb.

And thus the son addressed the fervent sire. *Or*, Thus the fervent sire addressed the son.

And a solemn stillness holds all the air.

He was mounted upon a hot and fiery steed, which seemed to know his aspiring rider.

If this day happen to be Sunday, then on the next day following, this form of prayer shall be used and the fast day kept.

A collection is making to protect and uphold such electors, as, regardless of threats and unmindful of intimidation, refused to vote, contrary to their desires and consciences, for A. and B.

He was more civil to me than he commonly is. *Or*, He was more civil to me than people commonly are to one another.

You can arrive in time, only by starting early. *Or*, You can do no more than arrive in time, by starting early.

Though he had been charitable to others, he found but few friends in his own extremity.

Persons having an income not amounting to a hundred and fifty pounds a year, are not liable to the income-tax.

The Romans understood liberty as well, at least, as we.

Theism can be opposed only to Polytheism or Atheism.

These are not such designs as any man who is born a Briton, ought to be ashamed or afraid, in any situation, in any circumstances, to avow.

The hen being in her nest, was killed and eaten there by the eagle. *Or*, The eagle having killed the hen, carried off her prey, and depositing it in her own nest, eat it there.

It has been said that Jesuits can not only equivocate. *Or*, Jesuits are not the only persons that can equivocate.

You will not think that these people, when injured, have no right at all to our protection. *Or*, Have less right than others to our protection.

Solomon, the son of David, and the builder of the temple of Jerusalem, was the richest monarch that reigned over the Jewish people.

Solomon, whose father David was persecuted by Saul, was the richest monarch of the Jews.

Lisias, speaking of his friends, promised his father never to abandon them. *Or*, Lisias speaking of his father's friends, promised his father never to abandon them.

The Divine Being, ever liberal and faithful, heapeth favours on his servants. *Or*, The Divine Being heapeth favours on his liberal and faithful servants.

Every well-instructed scribe is like a householder, who bringeth out of his treasure new things and old.

Dryden, in the following words, makes a very handsome observation, on Ovid's writing a letter from Dido to Eneas.

Imprudent associations disqualify us for instructing or reproving others. *Or*, Disqualify us for receiving instruction or reproof from others.

ALPHABETICAL INDEX

TO THE

MANUAL OF RHETORIC, AND THE MANUAL OF LOGIC.

ADAPTED NOT ONLY FOR REFERENCE, BUT FOR OCCASIONAL FURTHER INSTRUCTION.*

*** The first figures indicate the page: those within parenthesis, the section.

ABSTRACT, Abstraction. *Abstract* means, drawn off or separate from that in which it adheres, and which is called the CONCRETE. Thus, *white* or *whiteness* indicate an abstraction from any white substance; as, for instance, from *a white man;* which expression being applied to a particular white man, is the name of a concrete, though, till so applied, the name is abstract. All words have an immediate correspondence only with things abstract; page 109 (10). And many words are doubly abstract; *ib.*; also, 114 (15). A name or noun abstract is distinguished in logic from a name proper, and a name common; 118 (22).

Absurd, Absurdity, Reductio ad absurdum. *Absurd* means, contrary to reason. An assertion may be false without being absurd: it is false but not absurd to say that London is the capital of France. Absurd is what in thought *cannot be;* false, what in fact *is not.* It is absurd to say that a straight line can be a crooked one; *false* would be a word wrongly used in such a case. For an example of *Reductio ad absurdum*, see 169 (40).

Accents. These are otherwise called slides or inflections of the speaking voice; 57 (7).

Accident, Accidental. *Accidental*, in logic, means sometimes happening, and sometimes not. Accidents are also called Adjuncts; 7 (II. 2); and 158 (22). An Accident must be distinguished from a Property; and an Accidental definition from an Essential one; 136 (7). Accident is one of the Aristotelian predicables; 220 (4).

Accumulation. This, in rhetoric, is otherwise called Synathrœsmus; 16 (12).

* Controversial points, though they could not be altogether avoided in the body of the foregoing Manual of Logic and its Notes, (into the latter of which they are principally thrown,) are reserved for some further elucidation in this Index; over which the reader is requested to cast an inquiring glance, even though he may not have occasion to refer to it for the usual purposes of an Index.

Adjective. In logic, the *difference*, in a definition, is expressed by an adjective, which may be a mere adjective, or a logical, that is, a constructed adjective; 137 (third foot-note).

Adjunct. See Accident.

Affirmation, Affirmative. An affirmation or affirmative proposition is distinguished, in Aristotelian logic, from a negative one; 223 (5): in our logic, the difference is considered to be purely grammatical; 167 (39), and 226 (9); unless indeed when one person says *no*, or what is tantamount, and we oppose it by *yes*, or what is tantamount. See Positive.

Aggregate. This is one of the sources of sophistical delusion; 125 (35); and 197 (the Syllogisms).

Allegory. A method of speech proper only to rhetoric; 20 (19).

Alliteration. One of the minor expedients of rhetoric; 19 (15).

Anabasis. That which in rhetoric is otherwise called climax or gradation; 16 (12).

Anacœnosis. Communication, one of the expedients of rhetoric; 21 (23).

Anacolution. A failure of the grammatical construction, vindicated for the purposes of rhetoric; 15 (11); see also 70 (first foot-note).

Analepsis. A rhetorical method of recovering the construction of a period in proceeding to complete it; 14 (9).

Analogy. Parity of case, one of the topics of internal argument, 8 (II. 3); 159 (23).

Analysis. In logic, the procedure of the understanding in which we seek or seem to seek a conclusion not yet attained, in contradistinction to *Synthesis*, in which we first lay down what we intend to prove. The former is a *disentangling* of arguments; the latter a *putting* of arguments *together*. The former is the Inductive process; the latter, the Deductive.

Anaphora. A method of analepsis; 14 (9); 17 (12).

Anastrophe. A rhetorical transposition; 15 (10).

Antanaclasis. A term in rhetoric used in two ways; 14 (9); and 18 (14).

Antecedents. One of the topics of internal arguments; 7 (II. 2); and 157 (20).

Anticlimax. In rhetoric, the opposite proceeding to climax; 16 (12).

Antimetabole. A sort of antithesis in rhetoric; 18 (14).

Antithesis. Opposition of meaning and of words; 17 (14).

Antonomasia. In rhetoric, the use of a proper, for a common name; 20 (19).

Aparithmesis. A term in rhetoric for *enumeration;* 16 (12).

Apodosis. The former of the two members of a period; 14 (7).

Apophasis. The same in rhetoric as *paraleipsis*, or omission; 21 (23).

Aporia. An expedient in rhetoric, when the speaker chooses to appear in a state of doubt; 21 (23).

Aposiopesis. An expedient in rhetoric when the speaker chooses to hold back what he pretends he was about to say; 15 (11).

Apposition. A grammatical repetition of a noun in the same case, often used with good effect in rhetoric; 14 (9).

A-posteriori. An argument from the effect, as distinguished from an argument A-priori, or from the cause; 7 (II. 2); and 155 (19).

Apostrophe. A rhetorical address to an imaginary, a dead, or an absent person; 22 (24).
Apprehension. Erroneously considered by the Aristotelians to be a distinct operation of the mind, and divided into Incomplex and Complex; 144 (foot-note); 218 (3); 225 (8).
A-priori. An argument from the cause, as distinguished from an argument A-posteriori, or from the effect; 7 (II. 2); and 155 (19).
Argument; Argumentum ad judicium; ad hominem, &c.; Argumentative. An *Argument* is that which being itself admitted to be true, proves something else to be true; 147 (10); Arguments derive their names from three sources, 147 (11); Arguments investigated for the purposes of Rhetoric; 3–9 (I. 1.–II. 3);—for the purposes of Logic; 148–171 (12–41). The Argumentative, in rhetoric, is comprehended under Didactic composition; 2 (4).
Aristotle. The doctrine of the syllogism as taught by him and his followers, repudiated; 102 (note to Chap. I.); 142 (note to Sect. 2); 144 (foot-note). His doctrine of definition the only useful part of his logic; 129 (1). Alluded to as a juggler, but one who deceived himself before he deceived others, 219 (foot-note). See also in this Index, Formal Logic. See further in this Index, Philosophy, Philosophers.
Articulation. A constituent part of oral speech; 56 (2).
Asteism. A civil kind of sarcasm; 20 (21).
Asyndeton. The omission of conjunctions for the sake of rhetorical effect; 16 (12).
Attention. The will to retain a present state of the understanding by means of that which suggests it, till other states arise that are related to the first in a desired and expected manner.
Auxesis. A method of rhetorical exaggeration; 21 (22).

Barbarous words. An Exercise for avoiding; 28.
Bathos. A sinking in expression, which is almost always a fault; 16 (12).
Blacklock. The blind poet of Scotland,—an allusion to his case; 109 (note to the previous Section).
Being. A name including every possible subject of thought, except Not-being; 130 (2). See Thing, in this Index.

Cæteris paribus. Other things being equal, a Latin phrase often used in argument; 160 (24).
Case. State of the *case* is one of the parts of a judicial oration; 10 (2); 84, 85.
Catabasis. A descent or sinking in expression, otherwise called Bathos; 16 (12).
Catachresis. A metaphor bold to excess, an *abuse* of figurative speech to gain a certain end; 19 (17).
Category, Categorical, Categorematic. *Categorical* means collected or assembled in order to declare: hence it means positive as opposed to hypothetical. A category is a class of assembled things; 130 (2). Aristotelian Categories; 220 (4); and 226 (10). *Categorematic* is an expression used by the Aristotelians to denote a word which is capable of being employed by itself as a term, as *man* and *mortal*, in saying

Man is mortal. If a word cannot be so employed, as, for instance, an adverb, a preposition, &c., they call it Syncategorematic. In our system, a Categorematic term will be better called, *a logical part of speech unconstructed;* and a Syncategorematic term, *a mere grammatical part of speech.*

Cause. One of the topics of internal arguments; 7 (II. 2); 154 (17). A cause is that which we have found by experience to have one uniform consequent or consequents; 157 (20). It must be added, however, that this is not all that makes up what we mean by *cause.* We conceive an antecedent *Will* wherever there is an effect, and if the immediate antecedent cannot have a will because devoid of sense, we go to a higher Will that disposes all things, and among them the conditions of the immediate antecedent with relation to its uniform consequent.—See at Philosophy, Philosophers, in this Index, the concluding remarks.

Characteristic. In logic, the same as specific; 137 (8).

Charientism. A civil kind of sarcasm; 20 (21).

Circle. The etymological sense of the word *period;* 14 (7). The fallacy of reasoning in a circle; 190 (9).

Class, Classification. By *class,* we mean, several things assembled under one common designation. *Classification* is the origin of logical definition; 130 (2). Order, genus, kind, species, sort, variety, are words that mean the same as class.

Climax. A gradation, or rising of one circumstance above another in speaking; 16 (12).

Colloquial. *Colloquial* style; 12 (2). Exercise for improvement in; 32.

Common name. A name applicable in common to many things; 118 (22).

Comparison, Comparates. *Comparison* is the generic name of several topics of internal arguments; 8 (II. 3); 159 (23). *Comparates* are any two things which are compared together.

Composition. As a general term, it implies a putting of parts properly together to form a whole. Accordingly in literature, it is the formation of discourse according to the laws of grammar, of logic, and of rhetoric.

Conceits in poetry. See Fancy.

Conception. *Conception* is thus distinguished from Perception:—When we see, or hear, or feel, or touch, or taste, we have a *perception* of the thing seen or heard, &c.; but if, not seeing, or hearing, &c., we nevertheless have the thing mentally present, we are said to have a *conception* of it. A conception is otherwise called an idea; but note, that idea is liable to many other applications: see 108 (9, 10, and the following note); 117 (19, 20).

Concrete. The whole of that from which we mentally draw off (abstract) what we think and speak of separately. Every word stands immediately for what is abstract, but if it should be a noun common or a noun proper, the moment we apply it to a real or ideal person or thing, it is the name of a concrete, and may then, and not till then, be called a name-concrete. An adjective, as *foolish,* cannot be a term-concrete, though it may be a part of such a term, as of the phrase *a foolish saying,* which is a concrete name when applied to some particular saying. The forms of language often lead us to mistake mere abstractions for things concrete; 115 (16).

Conclusion. The expression which declares what the understanding attains or deduces from *premises;* 101 (1); 141 (2); 147 (10). Conclusion in the deductive process distinguished from Inference in the inductive; 164 (34).

Concurrent probabilities. A rhetorical delusion in speaking of them; 125 (35).

Conditional, Conditions. *Conditional*, in logic, is the same as hypothetical. But the difference indicated by either of the words, if it extends no further than to the form of a proposition, is purely grammatical; 168 (39, ad finem). For preliminary conditions of a dispute or discussion, see 139 (second note to Chap. III.)

Confirmation. The argumentative part of a regular oration; 10 (2).

Confutation. An occasional part of a regular oration; 10 (2).

Connotative. That which notes something, and, along with it, something more; 149 (foot-note). In our logic, all words are connotative: the distinction sought to be enforced by non-connotative will be sufficiently met by calling such a word as *John*, a term of single application; and such a word as *whiteness*, a term of double abstraction.

Consciousness. Error of the Sensationalists with regard to this part of our nature; 110 (first foot-note).

Consequence, Consequents. *A consequence*, in logic, is either an inference, or a conclusion. *Consequents*, the name of one of the topics of internal arguments 7 (II. 2); 157 (21).

Conviction, to Convince. The object of the rhetorician is *to convince*, as well as to instruct and delight:—*to persuade* implies all three of these, when, and in what proportion, needed. Logic enables us to convince *others*, by the practice of developing, for our *own* security and satisfaction, the means of conviction obtained by our studies generally in the several departments of learning; 1 (1–4); 140 (1).

Copula. The verb *is*, in Aristotelian logic; 218 (3).

Correlative. Terms are *correlative* which imply each other, as *father*, which implies *son* or *daughter;* and *son*, which implies *father* and *mother*. So likewise *king* and *subject*, *master* and *servant*, *cause* and *effect*, *antecedent* and *consequent*, are correlatives. But note, that the principle which such words make peculiarly and strikingly evident, is universally operative. We could not have the knowledge included in any word whatever, if we had not other knowledge which the word implies, though it does not directly express it. Thus we could not know what a man is, if we did not know what is not a man; and so with all things whatever; 163 (33).

Cross divisions. The error of confounding; 203 (14).

Datum, pl. Data. The *datum* is that which, in an argument, is *given* or conceded, and occurring in a syllogism, forms one of the two premises; 147 (10). It is one of the sources from which arguments derive their technical names; 3 (I. 1–7); 160 (25–32).

Decrementum. A species of sinking or bathos in style; 16 (12).

Deduction, Deductive. *Deduction* is the process by which knowledge is spread out before the understanding in words; 101 (2); 140–145 (1–6).

Definition. An important part of logic; its theory and practice; 129–140 (1–8, including the two notes). In attempting to develop know-

ledge, it is the first proof that can be given that we have the knowledge; 146 (8). A general topic of internal arguments; 6 (II. 1); 150–158 (13–21).
Deliberative. A term applied to the oratory of the senate, and of assemblies of the people; 2 (4). Subjects for exercise in; 82 (9, 10, 11).
Delivery. The fourth part of rhetoric; 3 (4); 56–59 (1–16).
Delusions of the rhetorical sophist. Cautions against; 121–129 (31–36).
Demonstrative. A term applied to oratory, so far as it embraces eulogy and instruction, when it is not proposed, for any immediate object, to move the will; 2 (4). Subjects for Exercise in; 82 (1–8). *Demonstrative*, in logic is said of argument which proceeds from admitted premises, to conclusions involved in those premises.
Descriptive, Description. *Descriptive*, in rhetoric, is comprehended under Narrative composition; 2 (4). *Description*, in logic, is called Accidental definition, 136 (7); 146 (8). Subjects for exercising learners in description; 74 (1–10).
Diasyrm. Another name for sarcasm, especially when applied with some degree of moderation; 20 (21).
Diction. The manner or style in which, as to his words and sentences, a person speaks or writes: it is the third part of rhetoric; 11–23 (1–24). Instruction and Exercises for improvement in; 26–55.
Dictum. Aristotle's *dictum*, the axiom of the formal syllogism, is referred to at 104 in the continuation of the note. See also 221 ("To a demonstration, an axiom," &c.)
Didactic. One of the general divisions of rhetorical composition; 2 (4).
Difference. A part in every real definition; 137 (8). It is always expressed by a grammatical or logical adjective, frequently, in the latter case, of very complicate construction; *ib.* (third foot-note). The difference, in an Accidental definition, may be carried out into a biography; 146 (8). Difference is one of the five Aristotelian predicables; 220 (4).
Dilemma. A description of syllogism whose peculiarity is not of a merely grammatical character; 169 (40).
Disposition. The art of arranging the arguments of a discourse. It is the second part of rhetoric; 10 (1, 2).
Disputation. Hints for ascertaining the reasonableness of a dispute or discussion, or of fixing its conditions; 139 (second note to Chap. III.)
Distribution. The meaning of the word *division*, in logic, explained by it; 132 (2, ad finem). The doctrine of distribution in Aristotelian logic; 221 ("Another necessary doctrine towards," &c.)
Division. See Distribution above. Division is also a term for one of the sub-parts of an oration; 10 (2).
Double abstraction. See 114 (15).
Douglas. Mr. James Douglas of Cavers alluded to, and quoted from; 152, 153 (foot-note); and 199 (foot-note).

Echo. A name sometimes used in place of other names of certain figures of speech; 14 (9); 17 (13).
Ecphonesis, Exclamation. A form of sentence in rhetoric; 13 (6).
Education. Specimens of faulty themes, and of a corrected one, on *Education;* 181, 182, 184.
Effect. One of the topics of internal arguments; 7 (II. 2); 155 (18).

Elenchus, Ignoratio elenchi. *Elenchus* (or *elench*), as a general term, means an argument, but, specially, the point or purpose which a course of argument keeps, or ought to keep in view. *Ignoratio elenchi* means the neglect to have such a point or purpose while arguing, or the neglect of keeping it steadily and clearly in view after having had it; 211–217 (18–22).

Elocution, Eloquence. *Elocution* means either Diction, or Delivery; 3 (foot-note). *Eloquence* is another form of the same word; but is commonly employed with a larger meaning, such as includes all the requisites of oratory.

Emotion. Rhetoric alone, of the three arts which teach the use of language, (Grammar and Logic being the other two,) concerns itself with our emotions; 1 (2); 101 (1).

Enantiosis. Antithesis or Opposition; a figure in rhetoric; 17 (14).

English History. Subjects for Narrative Exercises from; 71.

Enthymeme. A form of argument in which the datum is not expressed; 167 (37).

Enumeration. A topic of internal argument; 6 (II. 1); 151 (15). Also, a form of speech in rhetoric; 16 (12).

Epanalepsis. Epanaphora. Epanodos. } Modes of rhetorical verbal repetition; 17 (13).

Epanorthosis. Correction; an expedient in rhetoric; 21 (23).

Epiphora or Epistrophe. A mode of rhetorical verbal repetition; 17 (13).

Epizeuxis. A passionate repetition of words in rhetoric; 17 (13).

Erotesis. Interrogation, a form of sentence in rhetoric; 13 (5).

Essence, Essential. *Essence* is that (supposed something) which makes a thing what it is; 158 (22). Essential definition; 137 (8).

Etymological, Etymology. The *etymological* sense of a word; 119 (24). Etymology is one of the topics of internal arguments; 6 (II. 1) 150 (14).

Eulogy. A speech belonging to the class called Demonstrative; 2 (4). Outline for a Eulogy on a schoolboy; 82 (1).

Euphemism. A delicate way of saying what might otherwise give offence; 21 (22).

Examination questions. In Rhetoric, page 9: page 17: pages 22, 23: page 60. In logic, Introductory course, page 234.

Exclamation. See Ecphonesis.

Exergasia. A mode of rhetorical repetition by phrases of the same meaning; 17 (13).

Exordium. The Proemium or opening of an oration; 10 (2).

Experiment, Experience. *Experiment* is one of the two topics of externa. arguments; 6 (I.); 148 (12). *Experience* is the original source of all human knowledge; 155 (19).

Expression. In oratory, *expression* is the language of nature, mingling with, and giving soul to artificial language; 57 (8).

External arguments. These are employed in rhetoric when the auditors require instruction in what they do not yet know; 6 (1). Such arguments do not properly make a part of deductive logic, yet are usefully considered under it, because logic should be so studied as to prepare for rhetoric; 148 (12).

Extremes. The minor and major terms in the Aristotelian syllogism; 219 (4).

Fallacy, False, Falsity, Falsehood. *Fallacy* is a deceptive argument, which may not be *intended* to deceive. False means not true, either with, or without intention to deceive. A Falsity should mean what is false when there is no intention to deceive; but this meaning is not always adhered to. A Falsehood is, what is false when there *is* an intention to deceive; in which sense Falsity is also liable to be less properly used.

Familiar letters. Subjects for, 74–81.

Fancy. This is often used as a term synonymous with Imagination, but the best custom seems to warrant this difference: Imagination implies emotion as causing the presence of the conceptions, their character, combination, and sequence: (see Imagination:)—Fancy implies conceptions formed and continued voluntarily, that is, by choice, and without emotion. Fancy therefore is the origin of the *conceits*, as they are called, by which the school of poetry is distinguished which was prevalent in Italy at a certain period, and in our own country during the period which intervened between the Romantic school that closed about the end of Elizabeth's reign, and the Classical school that opened after the Restoration. The poets of that intervening school are called the *metaphysical* poets. Even Milton is often guilty of these *conceits*. Thus, in a sonnet which begins very naturally by saying that Shakspeare needs not a stone monument, he goes on with the conceit, that since we are all astonished by his genius, that is, turned into stone, we are all stone monuments to record his excellence; and in this manner, he *fancifully* makes out that any other monument is rendered unnecessary.

Figurative language, Figures of speech. See from page 12 to 22 (3–24). See an alphabetical Index, and the etymology of the names of the figures, page 24. Instruction and Exercise for the proper use of figurative language, pages 52–55 (Section 10, et seq.)

Figure of a Syllogism. The difference of the four figures of the Aristotelian syllogism explained; 223–225 (5, 6).

Flatness of style. Exercise for correcting; pages 30, 31.

Forensic. See Judicial.

Formal logic, Forms of an argument, Forms of language. The *Formal logic* of Aristotle objected to; 102 (Note); 122 (32); 133 (3); 142 (Note); 144 (foot-note), 167 (39). Some account of the syllogism of formal logic; 217–225 (2–6). Its principles opposed; 225–227 (7–11).

For *Forms of an Argument*, see 163–171 (33–41).

For certain *Forms of language* which are liable to produce error of thought, see 115 (16).

Fortitude. Example of a theme upon; 174.

French Speculative Philosophy. This subject alluded to; 106 (foot-note).

Friendship. Example of a theme upon; 185, *et seq.*

Function. Logical and Grammatical *function* distinguished; 101 (3); 144 (5).

General proposition. Such a proposition is often put forward by the rhetorician with a delusive purpose; 123 (33).
Generalization. A process carried on by means of a sign, which in logic is always a word; 120 (29).
Genus, Genera. For the purpose of clear comprehensive thought, we assemble things under kinds (*genera*); 130 (2, 3); 137 (8); 146 (8). *Genus* (kind) is one of the topics of internal argument; 6 (II. 1); 153 (16). It is one of the predicables of Aristotelian logic; 220 (4).
German Speculative philosophy. Remarks upon; 106 (foot-note); 111 (Note to Sect. 10); 117 (Note to Sect. 17).
Grammar. Distinguished from Rhetoric and Logic; 1 (1, 2); 101 (1); 144 (5, 6).
Grecian History. Subjects for Narrative Exercises from; 73.

Habit. Our acquiescence in the permanence of the natural course of things is moulded by habit; 152 (foot-note).
High style. Contrasted with the Colloquial and Middle style; 12 (2).
History of to-day. Example of a theme upon this subject; 65.
Homoioteleuton. One of the minor expedients of rhetoric; 19 (15).
Homonymous. *Homonymous* words are the same to the eye and ear, but different in meaning; as *bull*, a papal decree, and *bull*, the animal; in contradistinction to synonymous words, which are different to the eye and ear, but the same in meaning; as *angle* and *corner*. Paronymous words are either such as are nearly but not quite synonymous, or such as are grammatically allied to each other; for example, *logician* to *logic; firmness* to *firm; human* to *humanity*.
Hyperbaton. Transposition, when made for rhetorical effect; 15 (10).
Hyperbole. Rhetorical exaggeration; 21 (22).
Hypothesis, Hypothetical. Supposition, the state of mind under which knowledge is proposed, in order to be confirmed or set aside by experiment. A hypothetical proposition, when it is a mere *form* of *language*, takes its name from grammar; *our* logic is not, in this way, concerned with it; 168 (39, ad finem).
Hypotyposis. Vision, a figure in rhetoric; 22 (24).
Hysteron. A species of transposition in rhetoric; 15 (10).

Idea, Ideal, Idealism. *Idea* is a term liable to be so variously and vaguely applied, that, in a philosophical work, it is difficult to use it with safety. In Locke, it signifies what in this Manual is explained as the knowledge included under a word, whatever that word may be applied to signify. In many writings it means a conception, that is, the mental representation of some real thing, (see Conception), or what, in our doctrine, is called an *ideal* thing: it is often restricted to signify a *visual* ideal thing: —and lastly by the German Transcendentalists, it is used to signify what, in our doctrine, is called a thing metaphysical; *Idealism* is the doctrine of those who consider *ideas*, in this last mentioned sense, to exist originally in the mind; 106 (foot-note); 108 (9 and note); 109–112 (10 and note); 116 (17 and note).
Ignoratio elenchi. See Elenchus.
Image, Imagination. *Image*, in rhetoric, signifies the representation of something to the mind as an effect of emotion. *Imagination* is the

power or capacity to have emotions with such effects (compare Fancy, above). All the figures of speech, when in proper taste, spring from this power, and especially the more forcible; 22 (24); 52 (section 10).
Immortality. The Bible doctrine of the Immortality of man beyond the grave, and the Platonic doctrine of the Immortality of the soul, alluded to; 131 (foot-note).
Improvement in Style or Diction. The principle of such improvement as a part of Rhetoric, shown to differ from the improvement sought for in Grammar, and in Logic; 26 (Introduction).
Incrementum. A rhetorical ascent or gradation; 16 (12).
Induction, Inductive. *Induction* is the process of gathering knowledge; *Inductive logic*, that part of the art which teaches the use of words for this end; 101 (2); 104–111 (1–10). External arguments belong to Induction; 148 (12). Induction distinguished from Enumeration; 151, 152 (15).
Inference. A conclusion from premises in the inductive process; 107 ("In this process," &c.); 151 ("The argument from Enumeration," &c.); 154, 155 (17, 18).
Inflection. A slide or accent of the speaking voice; 57 (7).
Instinct. See Reason.
Intellection. The faculty of, (capacity for,) understanding: also, an act of the understanding, as a sensation is an act of the senses.
Interrogation. A form of sentence in rhetoric, otherwise called Erotesis; 13 (5).
Invention. The second part of Rhetoric; 3 (1).
Inward world. The same as ideal world; 108 (9).
Irony. A rhetorical figure in which, by our mode of delivery, we use terms of praise so as to signify the contrary; 20 (20).
Irrelevant premises. One of the modes of verbiage; 192 (10).
Is. This very abstract verb is called the copula, when employed to construct the syllogism of formal logic; 218 (3).
Judgement. Case in which we are properly said to use our *judgement*; 107 ("In this process," &c.). Judgement in Aristotelian logic is erroneously made a faculty of the mind, in contradistinction to Perception or Simple Apprehension, and Reasoning; 218 (3): 225 (8).
Judicial. A term applied to one of the three kinds of public speeches; 2 (4). Schoolboy cases for Judicial speeches; 84, 85.

Kant. His doctrine alluded to; 112 (note, ad finem); 117 (note to sect. 17); 135 (second foot-note).
Keeping the important point out of sight. A mode of rhetorical delusion; 126 (36).
Key to the Exercises for improving Style or Diction; 87–98. Key for correcting the sentences logically defective at pages 203, 204, and 206; 243.
Knowledge. Every separate word is the sign of knowledge, and all knowledge is in its nature abstract; 101 (3); 105–108 (2–9); 113 (12); 117 (18); 118 (21); 120 (28); 133 (3); 141 (2); 143 (4).

Language. Three arts, each having its own province, yet each assisting the others, join to render language perfect; 1 (1); 101 (1).
Letters. Subjects for familiar letters in writing rhetorical exercises; 74–81.

Literature. *Literature* may be said to grow out of a perfect use of language, such as Grammar, Logic, and Rhetoric teach. But Rhetoric is more immediately connected with Literature, with which indeed it is co-extensive; 2 (3, 4).

Litotes. A mode of rhetorical extenuation, otherwise called Meiosis; 21 (22).

Lively. One of the varieties of manner in delivery, arising out of certain emotive feelings; 58 (12); 59 (15).

Locke. *Locke* alluded to; 106 (foot-note). When logic shall be an art resting on a foundation universally admitted to be true, the merit of having turned inquiry concerning its nature and purpose, from the false direction into which Aristotle and his followers had led mankind, must be conceded, after Bacon, to John Locke, and to Horne Tooke. Yet both these men, in following out the well-conceived purpose of their respective inquiries, fell into egregious errors. Locke's purpose was, to inquire into the origin of human knowledge. This he pursues with too little regard to the moulding influence of language; and his distinction of Ideas into Simple and Complex, and these last into Modes, Substances, and Relations, are scarcely more than distinctions without a difference. On the other hand, Tooke attributes everything to language: he is a decided sensationalist, who, admitting Locke's foundation that our knowledge begins with sensation, admits nothing, except language, which is more than sensation; and while he argues justly against Locke's doctrine of Complex Ideas, sees nothing beyond the instrumentality of language in all beyond sensation. He hence concludes that *nouns* are the primary elements of language, and that *verbs* arose from nouns by the addition of something, which his Treatise ("Diversions of Purley") leaves unexplained. Horne Tooke was obliged to leave his speculation thus unfinished;—he had begun well, but he had taken a wrong turning. A course continued in the true direction, would have led him to the fact, that *verbs* are the primary language of our race,—are the speeches out of which, *nouns* are artificially evolved.

Logic. Logic discriminated from Grammar and Rhetoric; 1 (1, 2); 101 (1, 3); Aristotelian logic repudiated; 102 (note to chap. I.); Inductive Logic; 104 (1) Deductive Logic, 140 (1); the Aristotelian doctrine of logic explained, and then opposed by the Principles advanced in this Manual; 217–227 (1–11).

Major. An epithet applied to the term which is the predicate of the conclusion in the Aristotelian syllogism, 221 (4); and to the premise in which this major term is compared with the middle term, 222 (*ib.*). This premise is, in our logic, called the *datum*.

Materialism, Matter. These subjects alluded to; 131 ("There is an old division," &c. and foot-note).

Meditative. One of the varieties of manner in delivery, arising out of certain circumstances attending the speaker; 58 (11).

Meiosis. A mode of rhetorical extenuation, otherwise called Litotes; 21 (22).

Memory. *Memory* is conception, accompanied by the knowledge of time past, relatively to the actual present. But the term is often applied

to the readiness of reviving a whole series of mental acts, by reviving any one link of the series.

Metalepsis. A complicated metaphor; 20 (19).

Metaphor. A turn of a word from its proper application, so as to include a simile; 19 (17).

Metaphysical, Metaphysics. *Metaphysical* means the same as Transcendental, that is, transcending nature. *Metaphysics* are all those parts of learning which keep real and ideal (in one word, physical) things out of sight, or, at least only so far in sight as the weakness of the understanding may require; 109 (10, and note); 114–117 (15–17, and note); 118 (20, 21).

Method. *Method*, in many works on logic, follows Perception (or Simple Apprehension), Judgement, and Reasoning, as the fourth part of the art. As the first three distinctions are built on wrong grounds, so the fourth may be objected to, because it belongs to rhetoric much more than to logic:—See page 211, ("* It belongs to rhetoric," &c.) So far as *our* pupil in logic can be assisted with respect to Method in his essays to develop his knowledge, he will find appropriate instruction in Chapter V., from page 211, extending from Section 18 to the end of the Chapter.

Metonymy. A rhetorical use of one name for another; 19 (18).

Middle Style. Contrasted with the Colloquial and High Style; 12 (2).

Middle Term. That term in the formal syllogism with which the major and minor terms are separately compared; 219 (4); 222 (*ib.*)

Mill. Allusion to the doctrine of Mr. James Mill; 110 (first foot-note); —of Mr. John Stuart Mill; 120 (30, foot-note); 149 (foot-note).

Mimesis. Mimicry, or the sarcastic imitation of another's manner; 20 (21).

Mind. This subject alluded to; 131 (2, "There is an old division," &c., and foot-note).

Minor. An epithet applied to the term which is the subject of the conclusion in the Aristotelian syllogism; 221 (4); and to the premise in which the minor term is compared with the middle term; 222 (*ib.*) This premise, in our logic, is called the *argument* or *reason*.

Mode or Mood of a Syllogism. The difference in an Aristotelian syllogism, which is determined by the quality (affirmative or negative) and the quantity (universal or particular) of its premises; 223 (5).

Modulation. The management of the accents and the key of the voice in delivery; 57 (7).

Moral. As a term in logic, this word means *customary*, or having all the force which can be derived from custom. In this sense it is opposed to metaphysical. Thus, it is *morally* certain that we shall have thunder when the weather becomes very hot; it is *metaphysically* certain that the angles of every triangle are equal to two right angles.

Mutatis mutandis. Those things being changed, which the changed circumstances require; a Latin phrase often used in argument; 160 (24).

Names. These are proper, common, or abstract; 118 (20). Names of Arguments from three sources; 147 (11).

Narration, Narratives. The *Narrative* is one of the three kinds of Composition in rhetoric; 2 (4). The term is also applied to one of the

varieties of manner in delivery; 58 (9). Specimens of Narratives; 65, 67. Subjects for Narratives; 71–74.

Necessary. This term is properly applied to knowledge which is a part of some knowledge that includes it; 147 (10); 148 (12); 154, 155 (17–19); 164 (34).

Negation, Negative. See Affirmation. See also, No, Not.

Nerves. These, as they connect the organs of sense with the brain, seem, in the absence of the things of sense, to originate the ideal world; 108 (9).

No, Not. *No* or *Not* is an important element in the construction of the Aristotelian syllogism, but is viewed, in *our* logic, as a mere grammatical particle of no more logical importance than other grammatical parts of speech, 168 (39, "In our logic, again," &c.); 218 (3); 226 (9).

Nominal, Nominalist. A definition is called *nominal* when it does not explain the thing;—in contradistinction to a real one, which in some way does so; 134 (5). A *Nominalist* is one of a logical sect that, throughout the middle ages, opposed the Realists. (See in this Index Scholastic, Schoolmen.) The Realists maintained that universals correspond to *real* substantive ideas existing in the mind; while the Nomalists affirmed that they are *names* only; (viz., such names as, in this Manual, are called Common and Abstract.) The dispute in the old shape is now at rest, though in a new shape it still in some degree remains. Thus in a new shape we, in this Manual, are Nominalists, so far as we oppose the doctrine of original ideas, and the Idealists are Realists, so far as they maintain this doctrine. See 106–112 (6–10, and note).

Not. See No, above.

Not-being, Nothing. These words alluded to; 130 (2, and foot-note).

Notion. *Notion* may mean the knowing or knowledge of something. Having this sense, it is better to say of any single word that it is the sign of a *notion*, than that it is the sign of an *idea*. See Idea, above.

Object, Objective. These terms, as contradistinguished in modern philosophical use to Subject, Subjective, are alluded to; 137 (first foot-note); 175 (46).

Observation. Theme upon; 173.

Onomatopœia. The coining of a word from some natural sound; 19 (15).

Operations of the mind. These, which are said to be three in Aristotelian logic, are maintained to be but one in ours; 225 (8).

Opinion. This is a judgement or inference from limited facts, and therefore in different degrees, a real non-sequitur that awaits further facts.

Oration, Oratory. An *oration* is a speech: Oratory the art of speaking,—a term commonly used with a less comprehensive meaning than Rhetoric, which includes all that conduces both to good speaking, and good writing; 1, 2 (1, 2, 3, 4). An example of a school-boy's oration to his master; 69.

Outward. Objective; terms which, in the doctrine of logic, are applied to anything that is not already included in the mind. See Objective.

Oxymoron. In rhetoric, a saying which, though foolish if taken plainly, means a great deal; 18 (14).

Parade of logical forms. Caution against the delusion of such forms; 122 (32).
Paradiastole. In rhetoric, a peculiar sort of antithesis; 18 (14).
Paraleipsis. The same in rhetoric as *apophasis*, or omission; 21 (23).
Paralogy. False reasoning.
Paraphrase. The development in many words of what is, or may be expressed briefly. Its propriety can be justified only by its necessity. For an exercise to correct it when faulty, see page 32.
Parathesis. In rhetoric, the brief parenthetical notice of something, on which the speaker intends to enlarge when he has dispatched what is immediately in view.
Paregmenon. In rhetoric, a sort of antithesis; 18 (14).
Parenthesis. The insertion of a sentence within a sentence; 14 (8). Exercise including sentences requiring parenthesis; 45.
Paroemia. In rhetoric, an allusion to a proverb; 20 (19).
Paronomasia. A pun; 18 (14).
Paronymous. See Homonymous.
Particular proposition. This in logic is opposed to a *universal* proposition; 223 (5).
Parts of speech. In what way logic is concerned with what are called so in grammar; 144, 145 (5, 6).
Pathetic. One of the general divisions of rhetorical composition; 2 (4).
Pedantic style. Exercise for correcting it; 32.
Pen. Its proper use in rhetoric; 2 (3).
Perception. The knowledge or recognition of an object through the senses; in other words, a sensation accompanied by a revival of acquired knowledge. Compare Conception and Sensation.—The division of Man into Mind and Matter (see page 131) has always been the source of infinite perplexity, when philosophers have attempted to explain how perception takes place. The difficulty remained to recent times, till the Scottish philosophers cut the knot, in utter hopelessness to solve it. What it was before their time, I shall quote from the Sequel to Sematology to show. "How the mind could have cognizance of matter, was with the Greeks a question in very early times. Shut up, as they assumed it to be, like a light in a dark lantern, how did it become acquainted with the things out of the body? It was agreed on all hands that the mind could operate only where it was present; and how could it be present to the things of the material universe? In answer to this query, some asserted that the mind walked out of the body in order to take cognizance of the things of sense; while another set asserted that it did not walk out of the body, and consequently that it did not perceive the things of sense at all, but only the species, images, or ideas of them. This was explained by assuming that all material things dispersed from themselves filmy or shadowy representations, which, being received by the senses, were by them transmitted to the mind, which treasured them up; and that, with regard to most of them, the mind, by its peculiar chemistry, sublimated the particular into general ideas. The difficulty was met in later times by Leibnitz, with a theory still more fanciful. He taught that the soul and the body could have nothing to do with each other, being sub-

stances altogether different; and that the correspondence of their actions arose from this,—that the Creator had pre-ordained a perpetual similarity of action between them, so that whatever one did, however different in nature from what was done by the other, was nevertheless accompanied by a correspondent act, the soul and the body always chiming together with unfailing exactitude."

Period. A sentence whose parts are grammatically dependent to the end; 14 (7). Exercise for the construction of periods, with preliminary instruction; 33–38 (sect 4 et seq.)

Periphrase. A circumlocution,—a roundabout expression.

Peroration. The concluding division of a regular oration; 10, 11 (2).

Persuade. To *persuade* is the object of the rhetorician; but to accomplish this, he must be able to instruct, to convince, and to delight; 1 (1, 2, and foot-notes). See also Conviction above.

Personal subjects for exercise in rhetoric; 71.

Petitio principii. Various forms of this logical error; 188–191 (6–9).

Philosophy, Philosophers. These are connected with Logic, because if *Philosophers* go astray, there must be something wrong in their means or purpose, while trying to come at the *wisdom* which they profess to *love*. But in a *Manual* of Logic, an examination of past and present philosophy, with a view to test, by its rules, what is sound or what is unsound in means or purpose, will at once appear an impossible undertaking. In place of such an examination where it would properly come in the body of a larger book, it is proposed, in this Index, to furnish, nearly in chronological order, the names of certain leaders of sects, especially those of Greece, accompanied by slight notices of the perpetual opposition of opinion by which the sects were multiplied and kept distinct.

THA'LES, the earliest Grecian philosopher of distinguished name, is supposed to have flourished nearly seven centuries before the Christian era. He was a native of Mile'tus in Io'nia; and because Anaximan'der, Anaxim'enes, Diog'enes of Apollo'nia, (who must be distinguished from Diogenes the Cynic,) and Archela'us, were either taught by him, or were also natives of Ionia, they are all included in what is called the Io'nian or Ion'ic school, although they did not all profess the same speculative opinions. In this they coincided, that the universe springs from some one material; but whether from water as Thales taught, or from air as others insisted; whether it was palpable and finite, or imperceptible and infinite, they were not agreed.

PYTHAG'ORAS, a native of the isle of Sa'mos not far from Ionia, is supposed to have flourished a little less than six centuries before the Christian era, though some make him contemporary with Thales. He taught that number was the essence and principle of all things, deemed the souls of men to be emanations of the divine substance, and joined to this doctrine that of the transmigration of souls. He founded his school at Crotona in Italy, and hence it is called the Italian, though sometimes the Doric school.

XENOPH'A-NES of Col'ophon, contemporaneously with Pythagoras, also founded in Italy, namely at the town of E'lea, a school, hence called the Eleat'ic, which changed the emanative system of the

Italian school for the doctrine of one eternal infinite being, identical with the universe; a doctrine now called pantheism. The other most eminent men of this sect were Parmen'i-des and Ze'no. The date of this last philosopher, who must be distinguished from Zeno, the founder of the Stoics, is about four centuries and a half before the Christian era.

HERACLI'TUS of Eph'esus also flourished, as is supposed, about four centuries and a half before the Christian era. Though he properly belongs to the Italian school, yet he so far thought for himself, as in general to be distinguished individually. He deemed the one pervading principle of the universe to be fire, but not the elemental fire or flame, for this he held to be the excess of fire:—it is, according to him, a warm dry vapour; and this is the same as vital energy or the soul.

LEUCIP'PUS, the disciple of Zeno the Eleatic (see above), and the teacher of Democ'ritus, was the founder of what is sometimes termed the lower Eleatic school. He discarded the transcendental universe of the elder Eleatics, and placed the foundation of his theory in the world of the senses. He is regarded as the original propounder of the Atom'ic doctrine, afterwards taken up by the Epicure'ans. Democritus was his disciple with some degree of dissent from his master, by a less exclusive adherence to what we at present call sensational philosophy. Democ'ritus has been called the laughing philosopher, because he inculcated cheerfulness as the main end of our pursuits, while the melancholy Heracli'tus is often spoken of as the crying philosopher. Protag'oras was the disciple of Democritus, and made himself remarkable by his maxim, that man is the measure of all things.

SOC'RATES, the philosopher rather of practical morals, than of speculative opinions which propose to include morals in wider doctrines, was born at Athens 468 B.C., and put to death 399 B.C. Laying aside the problems concerning the origin and nature of the universe, and how and why man exists as a part of it, the object of his instruction was to make men good, as the only way to make them happy.—As to his mode of teaching, see Socratic in this Index. A host of disciples succeeded; but some exaggerated and some corrupted his doctrines. Ce'bes, indeed, in his Picture of Human Life, conveys the doctrine of his master with beauty and truth, although there is a slight colouring borrowed from Pythagoras. Xen'ophon acted up to his master's principles, and in that way demonstrated their value. Diog'enes, the founder of the Cyn'ics (men who lived like *dogs* and snarled like them,) exaggerated his tenets and his manners. To another of his disciples we must give a distinct place, namely to

PLA'TO. The immortal sage who bears this name was born at Athens 429 B.C., and died B.C. 347. He is the founder of the Academ'ic school, an epithet derived from the grove of Acade'mus, in which he lectured. Instructed in all philosophy that preceded him, he taught what best harmonized with his own capacious and comprehensive mind. His leading doctrine is the independence of God or spirit, and Matter, as the two distinct eternal principles by which

all things exist, the one operating formatively on the other, but not creatively. Our impressions of outward objects are the produce of ideas and matter, the ideas of the human soul being copies of exemplars that reside in the divine mind; and these divine exemplars are more and more remembered by man, the more he sees of their imperfect copies without. Hence, the striving of the well-taught soul to reach perfection.—See at Plato in this Index, references to allusions in the Manual.

AR'ISTOTLE, who was born at Stagi'ra in Mesopotamia, B.C. 384, and died 322, was for twenty years the disciple of Plato, but he at length divided from his master, and became the head of the Peripatet'ics, who were so called from the place in the Lyce'um, where they *walked* and discoursed. Among the points on which Aristotle differed from his master, one was his theory of ideas. Aristotle taught that ideas are the phantasms of things, and not the eternal intellectual types, which in Plato's doctrine give form to the things of sense:—See at Aristotle in this Index, references to parts in the Manual where his Logic is considered. See also Scholastic, Schoolmen.

ZE'NO, who must be distinguished from Zeno the Eleatic (see above), was the disciple of Pol'emo, an Academic; but he divided from his school, and became the founder of the Stoic philosophy. He was born in Cyprus, in some year between 357 and 352 B.C. and died in some year between 263 and 259 B.C. He taught at Athens in a place called the Porch or Portico, (Stoa,) whence the name of the Sect. To him must be attributed a sound division of all learning into Physics, Ethics, and what may be called Semeiotics, which latter department includes the Trivium,—Grammar, Logic, and Rhetoric. It was for its ethics that the Stoical philosophy was remarkable. A wise man, it taught, is unmoved by joy, grief, or other passion, esteeming all things as governed by an unavoidable necessity. In physics, it taught that the universe consists of cause and of matter. Death is the separation of the soul and body, but they are both material, and the former, though it continues after death, is perishable. The soul of all things is indeed imperishable, and of that soul all that has life, is part.—Among the great men that, in subsequent times, were of this sect, may be mentioned Ca'to of Utica, (ob. 46 B.C.,) Sen'eca, the Roman tragic poet, (ob. A.D. 65,) Marcus Aurelius, the emperor, (ob. A.D. 180,) and Epicte'tus, the Phrygian, the time of whose death is uncertain, but he is known to have lived into the times of the last-mentioned emperor.

EPICU'RUS taught at Athens while that city was thronged with Academics, Cynics, Peripatetics and Stoics, in all the vigour of recent institution. He died 270 B.C. His philosophy contrasts, in morals, most strongly with that of the Stoics. He made the senses the test of truth, and prudence the chief of virtues, because it restrains the appetite for pleasure only so far as indulgence would be hurtful to it. He maintained the atomic philosophy in physics, or that which attributes the universe to the confluence of atoms, that, being endued with gravity and motion, formed all the things of sense without the aid of a supreme intelligent power.

PYR'RHO is the best known of philosophers who bore the name of

Sceptics or doubters. He flourished about three hundred years before the Christian era at Elis in the Peloponne'sus. When the Stoics divided from the Academy, the remaining disciples of this school set themselves in opposition to the Stoics, and Scepticism was the effect, or the practice of controverting whatever was attempted to be taught as truth:—in fact the aim of the sceptical philosophy was to maintain the incomprehensibility of all subjects, and their art was the ability to speak with equal plausibility on both sides of every question. The school is called the New Academy, which further divided into the Second, Third and Fourth Academy.

In passing from philosophy and philosophers of ancient days to those of comparatively modern times, it will scarcely be fitting, in this Manual, to mention much more than the names of some philosophers, who led the way for speculation as it exists in our days. Something concerning modern speculators has already been offered:—see the references in this Index to Sensationalism and Idealism:—and for the peculiar character of all learning during the dark and middle ages, see in this Index Scholastic, Schoolmen. In Italy, Cardan, Bruno, and Campanella, who flourished from about the middle of the sixteenth to the beginning of the seventeenth century, opposed their own ways of thinking on the universe, the Deity, and the destinies of man, to the prevalent religious doctrines. The latter two met the then fate of heretics; a fate which entitles them to a respect which their opinions would scarcely claim; since these were nothing more than revivals, or mixtures, or modifications of the doctrines of the ancients. Descartes (ob. 1650) was the first of modern speculative philosophers, that, casting off the authority of the ancients, determined to think for himself. His philosophy, however, in the hands of his followers soon passed nearly into the old channels; Spinosa (ob. 1677) and Malebranche (ob. 1715) being both of them pantheists, the former material, with the Eleatics of old; the latter spiritual, with the Stoics and Pythagoreans. Hobbes, the philosopher of Malmsbury in Wiltshire, flourished about the same time as Des Cartes, and published bold opinions, that militated against religious motives of action, in a work called Leviathan. Leibnitz, a German, was also a contemporary; and his speculations, while they were more ingenious, were less offensive to the religious world. He is mentioned here on account of his doctrine relating to spirit and matter. (See Perception in this Index.) Hume was an English philosopher of the last century, whose doctrine threatened to undermine our reliance both on secondary causes, and on a First Great Cause. He has been met by many antagonists since his time, and among them by Dr. Brown, one of the Scottish School, whose Inquiry into the relation of Cause and Effect might be far more triumphant than it is; for "it is vitiated," says Sir John Herschell, "by one enormous oversight,—the omission, namely of a distinct and immediate personal consciousness of causation in his enumeration of the sequence of events by which volition is made to terminate in the motion of external objects." It is by observations like this last, which trace our highest knowledge from our first and firmest experience, that truth is more effectually served than by whatever specu-

lative opinions, if they have no other foundation than the busy agitation of the human brain.

Physical. Natural, including *real* and *ideal*, in contradistinction to *Metaphysical*, or transcending the real, and *ideal;* that is, the ideal which is a transcript or a combination of the real; 109 (10); 118 (12); 131 (2).

Physico-logical. An essential definition of a thing-physical is so called; 137 (8).

Plain. Style or diction so called in contradistinction to figurative; 12 (3). A delusion from confounding this sense of the word with another; 124 (34).

Plaintive. One of the varieties of manner in delivery, arising out of certain emotive feelings; 59 (14).

Plato. The doctrines of this philosopher alluded to; 109 (Note to Sect. 9); 111 (Note to Sect 10); 131 (foot-note). See also Philosophy, Philosophers in this Index.

Pleonasm. Rhetorical redundancy; 17 (13).

Ploce. A peculiar figure of speech in using a proper name; 18 (14).

Polyptoton. A sort of antithesis in rhetoric; 18 (14).

Polysyndeton. A way of prolonging an enumeration in rhetoric; 16 (12).

Positive. *Placed*, set, appointed: to this meaning *negative* may be opposed, and in the sense requiring such opposition, the word *negative* has in our system a logical value: not so when opposed to affirmative; see No, Not: see also Affirmative.

Practical, Practice. *Practical* directions concerning Inductive Logic, 113–129 (11–36): Concerning Definition; 134–140 (4–8, and Notes): Concerning Deductive logic; 145–179 (7–45): Concerning Errors in deductive *practice;* 180–217 (1–22).

Predicables. What they are in formal logic; } 220 (4).
Predicaments. What they are in formal logic; }

Preliminary conditions. The necessity of such conditions on proposing a dispute or discussion; 139 (second Note to Chap. III.)

Prolepsis. *Anticipation*, a rhetorical expedient: 21 (23).

Premises. What they are in our logic; 101 (1); 141 (2); 147 (10). What they are in formal logic; 222 ("When we have to show," &c.)

Pronunciation. The limited or special meaning of this term in modern tuition; 56 (5).

Proper names. This is a logical distinction, though commonly borrowed by grammar; 118 (22).

Property. *Property* distinguished from Accident; 136 (7); 158 (22). It is one of the five predicables in Aristotelian logic: 220 (4).

Proposition. In rhetoric, one of the occasional divisions of a regular oration; 10 (2). In logic, a *proposition* is a sentence which develops knowledge in a greater or less degree, and in *our* logic considered to be a virtual syllogism; 145 (6);—in Aristotelian logic, considered to be the enunciation of a *judgement*, and hence distinguished from *reasoning* as expressed by the syllogism; 218 (3); 223 (5).

Prose. A purely logical exercise must be in *prose:*—rhetoric employs prose for its ordinary productions; but since it includes poetry, it also includes *verse;* 2 (4).

Proximum genus. The genus immediately next above the subject of defi-

nition, to which genus we have to add the specific difference, and the subject is defined; 132 (2).
Purely logical. An essential definition of a thing metaphysical is so called; 137 (8).

Quaintness of style. Instruction and Exercise for correcting it; 27, et seq.
Quality and Quantity of Propositions. These are distinctions in Aristotelian logic, the former of which our logic resigns to grammar, admitting only the latter; 221 ("Then we have a difference," &c.), and 223 (5).
Questions for discussion. Outlines for school speeches; 82 (9–11). Absurdity of some such questions; 139 (second note to Chap. III.)

Real. *Real* things in contradistinction to *ideal;* 108 (9); 117 (18); 131 (2). A *real* definition in contradistinction to a nominal one; where, it must be remembered, the epithet is used with a less strict application; 135 (6).
Realist. See Nominalist.
Reason. *Reason*, in a special sense, means the same as Argument; which see. As the name of that capacity in man which distinguishes him from brutes, we may say, that it is the capacity to use signs of knowledge gained, in order to accumulate further knowledge; and to use the same signs in order to develop the knowledge accumulated. Briefly, man is a creature capable of language,—to use the Homeric epithet, a *voice-dividing* creature, that is, one who divides a natural cry into *parts of speech*. Be it observed that the born-deaf, and consequently dumb, have the mental capacity, though they want the exterior organ for language. We may again, in other words, say, that Reason is the power of abstraction. Brutes have knowledge with their sensations, but *their* knowledge is never abstract, that is, cannot be entertained apart from their sensations: this is Instinct; and this its true difference from Reason.
Relation. *Relation*, in Aristotelian logic, and even in Locke's Essay, is a distinct general head, set in contradistinction to other general heads under which the subjects of thought are accumulated. In *our* logic, it is *that* in which all knowledge has its origin and its existence: that is to say, in our logic, to know anything is to be aware of its relation to some other thing or things, and the relation of all these things to oneself.
Repetition. Rhetorical figures of *repetition;* 17 (13).
Rhetoric. *Rhetoric* distinguished from Grammar and Logic; 1 (1, 2); 101 (1).
Roman history. Subjects for Narrative Exercises from; 72.

Sarcasm. A figure in rhetoric that derives its force from the speaker's manner; 20 (21).
Scepticism. See Philosophy, Philosophers, above. All speculative philosophy, that is, philosophy (if so it must be called) which builds on hypothetical grounds, must, through its very character, terminate in scepticism.

Science. Strictly, that which can be demonstrated from self-evident truths; and as such demonstration is impossible in physics, we must look for it, strictly, in metaphysics alone; 109 (10).

Scholastic, Schoolmen. *Scholastic* learning and the *Schoolmen* alluded to; 134 (3). The father of the Schoolmen was John Scotus Erigena, a native of Ireland, who lived in the ninth century, and first introduced, from what source is unknown, the philosophy of Aristotle. Though at first opposed, it was soon adopted by churchmen as a scientific basis of the doctrines they taught, and it continued to be mixed with divinity and all other learning during full five centuries, in which time, however, we may trace certain eras and changes. A new era commenced with the rise of the Nominalists (see Nominalist) under John Roscelin, a Frenchman, who flourished in the twelfth century. The celebrated Abelard was his disciple. The third period saw the introduction into Europe of the writings of the Arabian philosophers, the translation of Aristotle from different versions into Latin, his undisputed predominancy in all the schools, and the complete triumph of Realism. It is at this time, namely, in the thirteenth century, that we have the great names among the schoolmen, such as Albertus Magnus, Thomas Aquinas, and Duns Scotus; the latter two of whom had their sects distinguished by the names of Thomists and Scotists. In reaching the days of William of Ockam, who died in 1374, we attain another era. His mind, better constituted or better taught, threw off much that was trifling, and more that was erroneous, in the prevalent learning; and in a little more than a century from his time, we begin to lose the distinctive features which the term scholastic is intended to signify when applied to literature.

Second intention. A term in formal logic to signify what in our logic is called a special meaning; 120 (26).

Sensation, Sensationalism, Sense. A *sensation* in itself is nothing more than a state of one's animal being; it is not perception till knowledge is joined to it. *Sensationalism* is the doctrine of those who think that knowledge begins by being sensation. A *sense* is the organ through which a sensation is received; 106 (6, and foot-note); 109 (note to Sect. 9); 110 (first foot-note); 111 (note to Sect. 10). The sense of any single word is the knowledge which it signifies; of two or more words is the development of knowledge; 101 (1, 2); 143 (4).

Sentiment. This term, though etymologically allied to the preceding, deviates from them in meaning, at least when the former are strictly applied. It includes knowledge, and emotion joined to knowledge; and is connected in meaning with the word *sense* only when the latter is loosely applied, so as to imply both sensation and thought; as in saying "He has a grateful *sense* of your kind acts."

Shifting senses of a word. Caution against the delusion hence arising; 124 (34).

Simile, Similitude. This is a figure in rhetoric; and also one of the topics of internal argument both in rhetoric and logic; 8 (II. 3); 19 (16); 159 (23).

Slides of the voice. The tones that form the modulation of speech; 57 (7).

Socratic. The *Socratic* method of reasoning, consisted in so putting ques-

tions, that the respondent, by his admissions, was led, step by step, to yield the conclusion in view. *Socrates*, see Philosophy, Philosophers.
Solemn. One of the varieties of manner in delivery, arising out of certain emotive feelings; 59 (16).
Sophistry. Suggestions for avoiding the delusions it creates, during the inductive process of learning; 121–129 (31–36).
Sorites. A form of language arising from an accumulation of arguments; 167 (38).
Special, Specialize, Specialization, Species. *Special* means, singled out by particular characteristics from the genus or kind to which the thing belongs; *Specialize* is to make special by reduction from a general application. *Species* means a *sort* under a kind or genus; 6 (II. 1); 120 (26); *ib.* (30); 137 (8); 146 (8); 153 (16).
Spiritualism. In speculative philosophy, this word signifies the doctrine that all which exists to the understanding is spirit or mind; a conclusion inevitable if we admit the doctrine of ideas as taught of old, or even as expounded by Locke. For if the mind is cognizant only of ideas, it is as much as to say, that the other presumed substance, namely matter, exists not to the mind, ideas being of the nature of the mind itself. Berkeley's theory is, in fact, incontrovertible while we adhere to the distinction between *mind* and *matter*, and the doctrine of *ideas* in connection with that distinction.
State of the case. One of the divisions of a judicial oration; 10 (2).
Stewart. *Dugald Stewart* alluded to; 104 (in the note to Chap. I.); 156 (foot-note); 219 (foot-note).
Style. Colloquial, Middle, and High *Style* exemplified; 12 (2). Instruction and Exercises for improvement in style; 26–55.
Subaltern genus. That which is a species with respect to some higher genus; also that which has only species immediately under it; 132 (2).
Subject, Subjective. See Object, Objective.
Subject-matter. Where there is no subject-matter to be understood, there can be nothing understood. Hence, a monstrous absurdity in the doctrine of the formal syllogism; 142 (note to Sect. 2, ad finem.)
Summum genus; *pl.* Summa genera. The highest genus; 130 (2). The *summa genera* of Aristotelian logic; 220 (4).
Syllogism. The syllogism virtually exists in every form of speech developing thought by two or more words. The name, however, is strictly given only to the form consisting of three propositions, the first and second being premises, out of which a necessary truth arises, which is expressed by a third preposition called the conclusion; 101 (1); 141, 142 (2 and note); 163–167 (33–36).
The syllogism of formal logic. 217–225 (1–6).
Symploce. A mode of repetition in rhetoric; 17 (13).
Synathrœsmus. Accumulation, a figure in rhetoric; 16 (12).
Syncategorematic. See Category, Categorematic.
Synchoresis. Concession, one of the expedients of rhetoric; 21 (23).
Synecdoche. Comprehension, a figure in rhetoric; 19 (18).
Synepy. The complete union in delivery of words that join to make sense; 57 (6).
Synœceiosis. A sort of antithesis in rhetoric; 18 (14).

Synonymous, Synonymy. *Synonymous* words are those that differ in spelling and sound, but are the same in meaning; as *periphery* and *circumference*: compare Homonymous. *Synonymy* in rhetoric is one of the figures of repetition; 17 (13).
Synthesis. See Analysis.

Tactual impressions. These are probably the early inlet of all our fundamental knowledge; 109 (note to Sec. 9).
Tapinosis. A method of rhetorical extenuation; 21 (22).
Technical language. Though in the *argumentum ad doctrinam* technical language is justifiable, it ought not to be used in ordinary cases; 4 (3); 27 (Sect 1, and examples at bottom of page 28 and top of page 29).
Testimony. This is one of the topics of external arguments; 6 (I.); 148 (12).
Themes. *Themes* are an admirable means of bringing a learner to a consciousness of his deficiencies in the inductive process of logic: the word theme has two meanings; examples of themes; 113 (11); 171 (43); 173, 174 (45); 184 (3); 185 (4). Outlines for themes; 229.
Thesis. A *Thesis* is a theme given out in the form of a proposition; 177–179 (47).
Thing. This is a term includiug every possible subject of thought, except Nothing or Not-being; 130 (2). In this Manual, *things* are distributed into things-physical and things-metaphysical; and the former into things-real and things-ideal; 131 (2). *Nothing* or *Not-being* is a thing-metaphysical.
Thinking. That conscious state in which things present themselves really, or ideally, or in part really, in part ideally, either under familiar relations or under new relations to each other and to the thinker; 141 (2). One of the effects of thinking described; 212 (18).
Tooke. For an allusion to Horne Tooke's doctrines, see Locke above.
Topic. *Topics* are so called, as being the *places*, where arguments are to be found; 5-9 (II. 1,—II. 3); 148–160 (12–24).
Transposition. Examples of rhetorical transposition; 15 (10). Also of sentences whose parts require redistribution; 38–42 (Sect. 5).
Triads of propositions. The number of these that can be made up out of the Aristotelian extremes and middle term, joined by *is* and *is not*; 223 ("Now disregarding," &c.), and 224 ("And as, in the first," &c.)
Trope. A *trope* is distinguished, by some teachers, from a *figure* of speech; 12 (3, and foot-note); 19 (16).
Trust not appearances. Example of a thesis on this subject; 177–179 (47).
Truth. *Truth* is knowledge that is held with certainty. But what is truth to one individual mind, may not be truth to others. Hence, we often justly speak of truth as something independent of the mind, namely as knowledge yet to be reached, and even as knowledge beyond all present reach.

Vehement. One of the varieties of manner in delivery, arising out of certain emotive feelings; 59 (13).
Verb or Word. The verb or word is never logically complete, till all is expressed by it which we intend to develop; 144 (5).

Verbiage. Varieties of error under this name exemplified; 180 (2); 188–204 (6–14).
Vowel sound. What a *vowel-sound* is; 56 (3).

Universal. A *universal* proposition stands opposed, both in Aristotelian, and in *our* logic, to a *particular* proposition; 221 ("Then we have a difference," &c.), and 223 (5).

Wedgwood. *Mr. H. Wedgwood* alluded to; 109 (note to Sect. 9).
Whately. *Dr. Whately* alluded to; 102–104 (note to Chap. I.); 110 (second foot-note); 116 (foot-note); 122, 123 (32, and foot-notes); 124, 125 (34); 134 (4, and foot-note); 138 (first foot-note to Chap. III.); 142 (note to Sect. 2); 144 (foot-note); 191 (9); 193, 194 (9, continued); 197 ("Hence it is matter of complaints," &c.); 219 (foot-note); 226 (foot-note).
Whewell. *Dr. Whewell* alluded to; 111 (note, sect. 10); 156, 157 (foot-note).
Will. The impulse of desire, accompanied by the knowledge, that what we desire we have the power to compass.

A GUIDE TO SYLLOGISM,

OR,

A MANUAL OF LOGIC.

LONDON:
Printed by C. Richards, 100, *St. Martin's-lane, Charing-cross.*

A GUIDE TO SYLLOGISM,

OR,

A MANUAL OF LOGIC;

COMPREHENDING

AN ACCOUNT OF THE MANNER OF DISPUTATION NOW PRACTISED IN THE SCHOOLS AT CAMBRIDGE;

WITH SPECIMENS OF THE DIFFERENT ACTS.

ADAPTED TO THE USE OF

THE HIGHER FORMS IN GRAMMAR SCHOOLS, AND OF JUNIOR STUDENTS AT THE UNIVERSITY.

BY

THE REV. CHARLES WESLEY, B.D.

Late of Christ's College, Cambridge.

"A Syllogism is a form of reasoning which serves to compress much matter into a little compass, and helps to investigate truth with certainty."—*Bishop Watson.*

LONDON:

HENRY G. BOHN, 4, YORK STREET, COVENT-GARDEN;

DEIGHTON & SONS, CAMBRIDGE; J. PARKER, OXFORD.

M.DCCC.XXXII.

INTRODUCTION.

THE object of the compiler, in arranging these pages, is to lead the student, by the shortest path, to an acquaintance with the more interesting and practical parts of Logic. It appears to him, that there are many persons who would decline the perusal of a treatise on *Apprehension*, the *Divisions of Nouns*, and the different sorts of *Predicables*, who might be interested in examining the nature of Propositions, and the principle on which an Inference is conclusively drawn.

He is confirmed in this opinion, by having often observed, that youths of an ingenious and intellectual turn, disinclined as they might be to undertake the perusal of a bulky volume upon Logic, are generally gratified when an argument is set before them, in the brief and lucid form of a Syllogism.

1051398

The Appendix contains a summary account of the manner of syllogizing in the schools at Cambridge; and it is hoped that younger disputants, who are about to appear there, may derive some advantage from the following pages.

To the Regii Professors in Divinity, Law, and Physic, and to the Rev. Dr. Graham, Master of Christ's College, Cambridge, the compiler has to offer his most grateful thanks for the numerous obligations under which they have laid him.

He has the honour also to confess himself indebted to the learned and accomplished author* of the "Elements of Logic," not only for the advantage of his published writings, but for many acts of private courtesy.

* The present Archbishop of Dublin.

A GUIDE TO SYLLOGISM,

&c. &c.

OF REASONING AND SYLLOGISM.

1. An act of reasoning is performed by comparing two ideas together by means of a third, that must agree with *one* of them. If this third idea agrees with the other two, those two, of course, *agree* with one another; if it agrees with only one, they, of course, *disagree* with one another.*

2. A syllogism (from *συλλογίζομαι*, to reason) is an argument stated at full length, and in regular logical form.

3. By an argument's being stated at full length, is meant, that the application of the third idea to

---

* E. G. In reasoning on the character of Cæsar, if I wished to ascertain whether the idea of 'a good man' agreed with him, I might take, for a third idea, that of 'Tyrant.' On finding this *agree* with 'Cæsar,' and *disagree* with 'good man,' I should say that the ideas of 'Cæsar' and 'good man' *disagreed with one another*; or, in other words, that 'Cæsar was not a good man.' The third idea, thus employed to assist us in forming a judgment, is called *a middle term.*

the two others is expressed in terms, and that however obvious the application may be, in the case of one of them, it is never, on that account, taken for granted.

4. By an argument's being stated in regular logical form, is meant, its being so arranged, that the conclusiveness of it is manifest from the mere force of the expression, *i. e.* without considering the meaning of the terms. Thus,

Every Y is X,
Every Z is Y, therefore
Every Z is X.

If you grant the two former assertions, (or premises,) you cannot deny the conclusion.

5. Syllogisms are divided into Categorical,(from *κατηγορέω*, I affirm,) and Hypothetical, (from *ὑπόθεσις*, a supposition.) Categorical syllogisms are divided into Pure and Modal; hypothetical syllogisms into Conditional and Disjunctive. Syllogisms take their names from the different kinds of propositions employed in forming them.

OF PROPOSITIONS.

6. A proposition is a sentence that affirms or denies. It consists of three parts, viz. the *subject*,

or thing spoken of; the *predicate,* or that which is said of it; and the *copula,* which must be the substantive verb, with or without a negative particle, as the subject and predicate happen to agree or disagree.

7. The subject and predicate are called Terms or Extremes,* because, according to logical order, the subject is placed first, the predicate last, and the copula in the middle.

Ex.— | *Subj.* Vice | *Cop.* is | *Pred.* detestable. |

| *Subj.* Virtue | *Cop.* is not | *Pred.* unrewarded. |

8. The substantive verb alone is recognized by logic; all other verbs are resolvable into the substantive verb with a participle or adjective.

Ex.—The summer approaches.

| *Subj.* The summer | *Cop.* is | *Pred.* approaching. |

He does not know it.

| *Subj.* He | *Cop.* is not | *Pred.* aware of it. |

9. As the copula is used merely to express the agreement or disagreement of the terms, it is, or

* In speaking of a syllogism, the term "extremes" is often understood to imply the extremes of the *conclusion.*

may be, always put in the present tense. Should the tense of the substantive verb modify the sense of the proposition, this circumstance must be viewed as part of one of the terms.*

Ex.—Troy *is* existent.

Troy *was* existent, *i. e.*—

Subj.	*Cop.*	*Pred.*
Troy	is	a place that was formerly existent.

10. An adjective or participle, though it cannot be the subject, may yet be the predicate of a proposition; but even then a substantive appears to be understood; as, "Life is short," "Art is long." In these two propositions, the word "thing" may be supplied to each predicate.—*See* SYNCATEGOREMATIC WORD, *in the Index.*

---

* The variety of expression allowable in language will often occasion a proposition to appear in a form very different from that recognized by logic. To that form, however, all propositions are reducible; and the pupil should be accustomed to bring into it with readiness, propositions of a dissimilar construction. E. G.

"Of his kingdom there shall be no end."

"An end of his kingdom is that which shall not be."

"In loftiness of thought Homer surpasses Virgil."

"Homer is a poet who surpasses Virgil in loftiness of thought."

"It is the duty of youth to reverence age."

"To reverence age is the duty of youth."

11. Propositions are either Categorical, (and subdivided into Pure* and Modal,) or Hypothetical (and subdivided into Conditional and Disjunctive.) This division is according to *substance*. They are either Affirmative or Negative. This division is according to *quality (i. e.* the quality of the *expression.)* They are Universal or Particular. This division is according to *quantity*.†

---

* A pure proposition is sometimes called "propositio de inesse," because it simply states that the predicate is, or is not, (metaphysically,) in the subject.

† Another division of propositions is into Singular and Indefinite. A singular proposition is one of which the subject is an individual, (either a proper name, a singular pronoun, or a common noun with a singular sign.) E. G. "Cæsar overcame Pompey," "I am the person," "This fable is instructive." But as these propositions predicate of the *whole* of the subject, they fall under the rules that govern universals. It is to be observed, that if the subject of a proposition consist of a number of nouns *collectively* understood, so that they are viewed as *one single thing or body*, the proposition is *singular*. E. G. "All the books in Ptolemy's library amounted to 200,000 volumes," *i. e. all together*. "Two and two make four." "Cæsar, Pompey, and Crassus, constituted the first Triumvirate." When the word *together* can be added to the subject of the proposition, or when the word *each* cannot be introduced, that proposition is *singular*.

An indefinite proposition is one that has no sign of universality or particularity affixed to it, but leaves us to

12. A categorical proposition declares a thing [κατηγορεῖ] absolutely, as "I love," or "I am loving." "Man is not infallible." These are *pure* categoricals, asserting *simply* the agreement and disagreement of subject and predicate. "The wisest man may possibly be mistaken." "A prejudiced historian will probably misrepresent the truth." These are *modal* categoricals, asserting the *manner* of the agreement and disagreement between subject and predicate.*

13. A hypothetical proposition consists of two or more categoricals, united by a conjunction called the Copula. It asserts, not absolutely but, under an hypothesis or condition: such propositions are denoted by the conjunctions used in stating them. E. G. "If man is fallible, he is imperfect." This

---

judge, from the nature of the connexion between the terms or Extremes, (No.7,) whether it should be reckoned as universal or particular. See No. 19.

* The modality of a proposition is usually considered to affect the copula. Logical writers have selected, as most worthy of remark, four modes of connexion between subject and predicate:—viz. necessary, possible, impossible, and contingent. E. G. "Man is necessarily an animal." "A globe may possibly consist of water." "It is impossible a man should be a stone." "John may, or may not, be learned."

is called a conditional proposition, denoted by the conjunction "if." "It is either day or night." This is a disjunctive hypothetical, and is denoted by the disjunctive conjunction "either."

14. An affirmative proposition is one of which the copula (No. 6.) is affirmative, A negative proposition is one of which the copula is negative. There is an example of each in No. 7.

15. A universal proposition is one of which the predicate is affirmed or denied of the *whole* of the subject. Its usual signs are "all," "every," "none," &c.;* or a universal proposition may have for its subject a proper name, or a common name with a singular sign.—See note to No. 11. E. G. "All tyrants are miserable," "No miser is rich," "England is an island."—A particular proposition is one of which the predicate is affirmed or denied of only *part* of the subject. Its usual signs are "some,"

---

* To the signs of universality might be added "whoever," "each," "neither," "always," "every where," &c. To those of particularity, "a few," "not every," "sometimes," "somewhere," &c. There are some particular signs which make a near approach to a universal affirmative, as "many," "very many," "almost all," "by far the greater part," &c. Some, on the other hand, come very near to a universal negative, as "few," "very few," "scarcely any," &c.

"many," "few," "several," "most," and "all" or "every," if the copula be negative. E.G. "Some islands are fertile." "Many worthy men have to complain of ill fortune." "Most men are fond of novelty." "All tyrants (or some tyrants) are not assassinated." "None but" means "some, and those only," or "one person, thing, or object, and that only:" it is, therefore, the sign of a particular, or a singular, proposition.

DISTRIBUTION OF TERMS, SYMBOLS OF QUANTITY AND QUALITY, ETC.

16. In all universal propositions, the subject is *distributed;* an expression which signifies that a term is used in its fullest extent; that it stands for all its Significates, or the several things which it signifies: so that there is not an individual to which the common term is applicable, that it does not embrace. As, in the example, "All tyrants are miserable," the common term includes Dionysius, Phraates, Nero, and every individual who is a tyrant. In all particular propositions, the subject is undistributed; it stands for only part of its significates, and the common term then embraces only a part of the individuals to which it is applicable:—

as, in the example, "Some islands are fertile," the common term "island," though applicable to Iceland and all barren islands, does not embrace them.

17. There are four kinds of pure categorical propositions, distinguished by the symbols, A, E, I, O.

Universal affirmative, A.

Universal negative, E.

Particular affirmative, I.

Particular negative, O.

18. The connexion between the extremes of a proposition is Necessary, Impossible, or Contingent.

19. To determine whether an indefinite proposition should be viewed as particular or universal, we must look to the connexion between the extremes; *i. e.* we must consider of the subject and predicate, whether they *necessarily agree*, or *necessarily disagree*, or *may*, or *may not agree*. The nature of the connexion between the extremes is called the *matter* of the proposition. In necessary and in impossible matter, an indefinite is understood as a universal; as, "Birds have wings;" *i. e. all.* "Birds are not quadrupeds;" *i. e. none.* In contingent matter, *i. e.* where the terms sometimes agree and sometimes not, an indefinite is understood as a particular; as, "Food is necessary to

life;"* *i. e. some kind of food.* "Birds sing;" *i. e. some* birds sing. "Birds are not carnivorous;" *i. e. some* birds are not, or, all are not.

20. The rules for distribution are these:—

1st. All universal propositions, and no particular, distribute the *subject.*

2nd. All negative, and no affirmative, the predicate.†

---

* The learner should observe that the term in question is "*a thing necessary to life,*" and not conclude, from the word "necessary," that the connexion between the terms "food" and "necessary to life" is a necessary connexion. It is *contingent;* because *it happens* that there are kinds of food which are *not* necessary to life; as *it happens* that there are birds which do *not* sing, and birds which *are* carnivorous. Whereas it *cannot happen* that *any* creature without wings, or that *any* quadruped, should be a bird. It is *necessary* that a creature should have wings to constitute it a bird, and *impossible* for a quadruped to be one.

† Thus the distribution or non-distribution of the *subject* of every proposition depends on its *quantity;* the distribution or non-distribution of the predicate, on its *quality:* and note further, that if, in an affirmative proposition, the whole of the predicate should agree with the subject, the circumstance is *accidental,* and not *implied* in the *form of expression.* In the propositions, "All men are rational animals," and "All men are animals," the form of expression is the same; but in the one instance, it so happens, that the whole of the predicate agrees with the subject, which is

21. Two propositions are said to be opposed, when, having the same subject and predicate, they yet differ in quantity, or quality, or both. (See Nos. 11, 14, 15.) The use of the rules of opposition is, that they immediately point out what we may infer with regard to the truth or falsity of any other proposition which has the same subject and predicate as the proposition before us, but differs from it either in quantity, or quality, or both.

22. There are four different kinds of opposition: —1st. between the two universals A and E, differing in quality only, and called *Contraries.* 2nd, between the two particulars I and O, differing also in quality only, and called *Subcontraries.* 3rd, between A and I, or E and O, differing respectively in quantity only, and called *Subalterns.* 4th, between A and O, or E and I, differing respectively both in quantity and quality, and called *Contradictories.**

---

not the case in the other. "All rational animals are men," but "all animals are not men." In a just definition, the terms are always *exactly equivalent*, and therefore, *convertible.*

* Four things are requisite to form a just contradiction; —viz. that we speak of the same thing 1st in the same sense; 2nd, as to the same part; 3rd, compared with the

23. The signs "no" and "none" imply both universality and negation; they are contradictory, therefore, to the *particular* sign with an *affirmative* copula. We cannot contradict "some are," by "all are not." E. G. "*Some* monarchs *are* tyrants," "*All* monarchs *are not* tyrants,"—which are subcontrary propositions, perfectly compatible, and both particular.

24. Of subaltern propositions, the universal is called *subalternans*, the particular, *subalternate*.

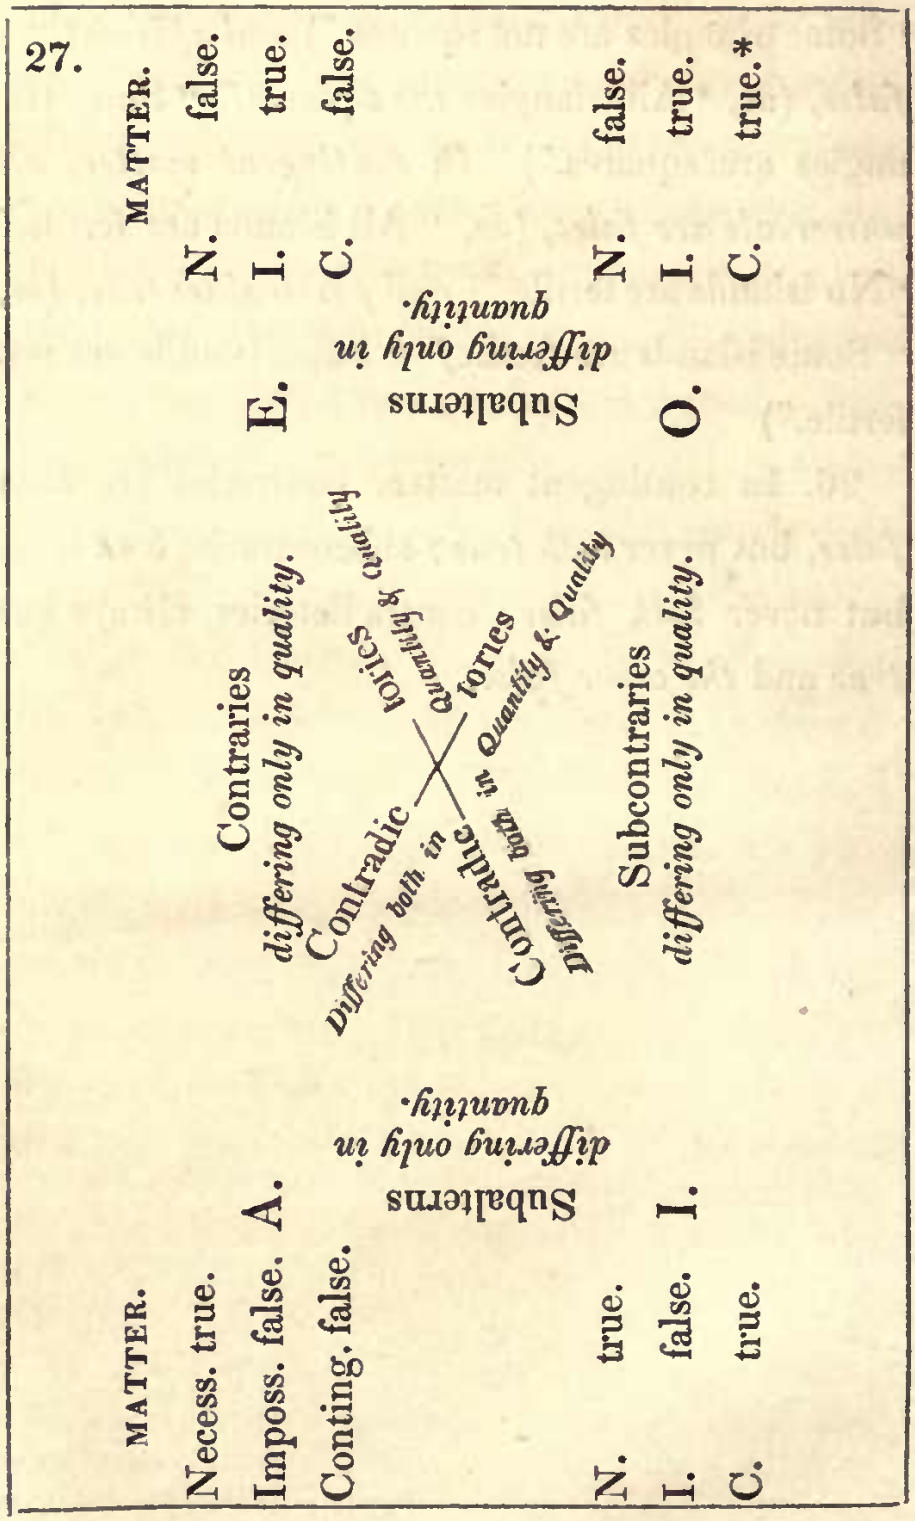
25. *In necessary matter, all affirmatives are true,* (as, "All islands are surrounded by water," "Some islands are surrounded by water,") *and negatives false,* (as, "No islands are surrounded by water," "Some islands are not surrounded by water.") *In impossible matter, all negatives are true,* (as, "No triangles are squares,"

---

same thing; 4th, existing at the same time. By omitting one of these conditions, *is* and *is not* may be compatible. E. G. The carcass of a man *is* and *is not* a man; for *it is* a dead man, *it is not* a living one. 2nd. Zoilus *is* and *is not* black; for his face *is* black, and his hair *is not* black, but red. 3rd. Socrates *has* and *has not* a full head of hair; for he *has*, if compared with Scipio, he *has not*, if compared with Xenophon. 4th. Nestor *is* and *is not* old; for *he is*, if you speak of his third age, *he is not*, if you speak of his first.

"Some triangles are not squares,") *and affirmatives false,* (as, "All triangles are squares," "Some triangles are squares.") *In contingent matter, all universals are false,* (as, "All islands are fertile," "No islands are fertile,") *and particulars true,* (as, "Some islands are fertile," "Some islands are not fertile.")

26. In contingent matter, contraries are *both false,* but never *both true;* subcontraries *both true,* but never *both false;* contradictories, always *one true* and *the other false.*



* The truth or falsity of propositions is here seen to depend on the matter. See No. 19. Propositions may be

28. In subalterns, the truth of the particular, or *subalternate,* follows from the truth of the universal, or *subalternans;* and the falsity of the universal from the falsity of the particular.* The opposition between contradictories is so perfect, (since they differ both in quantity and quality, see No. 22.) that if any proposition is true, we may be sure its contradictory is false; if false, its contradictory true, &c.

CONVERSION OF PROPOSITIONS.

29. A proposition is said to be *converted,* when the subject and predicate are made to exchange places, as, "No triangles are squares," "No squares are triangles." The use of conversion is to give a ready insight into what may be inferred from another proposition, that differs from the one before us, by the terms being transposed. This change in the position of the terms may be combined with that of the quantity, or quality, or both, or neither,

---

framed in A, E, I, O, on the following subjects, and adapted to the scheme by way of exemplification.

N. That islands should be surrounded by water.

I. That triangles should be squares.

C. That islands are fertile.

* If *all* islands are surrounded by water, it is plain that *some* must be so. If that *any one* triangle is a square be false, it must be false to say that *all* are so.

as the case may be. By conversion, a facility is likewise afforded in effecting the reduction of syllogisms, a process that will presently be explained.

30. The above is an instance of *simple conversion;* the subject and predicate being merely transposed; but as this can be done only when the terms of a proposition are of *exactly the same extent,* two other methods are in use, which enable us to convert, consistently with truth, every proposition whatever:—viz. 1st. the limitation of the predicate of the Exposita, (or proposition given,) from universal to particular, which is called conversion *per Accidens,* or by Limitation; and 2ndly, the adding *not* to the predicate of the exposita, and then denying its agreement with the subject, which is called conversion by Negation or Contra-position. But in the case of O, (the particular negative,) conversion by negation is effected by joining the negative particle of the copula to the predicate of the exposita, and then transposing the terms, as if the proposition had been I.

31. No conversion is employed for any logical purpose, unless it be *illative; i. e. when the truth of the converse is implied* by the truth of the exposita. (No. 30.)

32. Conversion is then only illative, when *no*

term is distributed in the converse, which was not distributed in the exposita; else, you would employ a term *universally* in the converse, which, in the exposita, was used only *partially*. (For "distributed" see No. 16.)

33. The following examples will shew how every proposition (A, E, I, O,) may be illatively converted, by some one of the three methods above mentioned:—viz. 1st, simply; 2nd, *per accidens*, or by limitation; 3rd, by negation or contraposition. E, I, simply; for E distributes both terms, (No. 16, 20.) and I, neither (No. 16, 20.); they are, therefore, of exactly the same extent (No. 30.), and simply convertible.

(E) No triangles are squares; therefore
No squares are triangles.

(I) Some islands are fertile places; therefore
Some fertile places are islands.

E, A, *per accidens*, or by limitation; E, because the predicate being distributed as well as the subject, and admitting, therefore, of the sign of universality, (as is shewn by simple conversion,) it must, as a universal, include the particular.

(E) No triangles are squares; therefore—
Some squares are not triangles.

(which follows from the truth of the simple converse.) A is converted *per accidens*, or by limitation; because, since it does not distribute the predicate (No. 20.), that predicate will not admit of a universal sign, and therefore requires a particular one.

(A) All birds are animals; therefore
Some animals are birds.

You could not say, "All animals are birds."

A, O, by negation; A, because the subject agrees universally with the predicate; so that what disagrees with the predicate cannot agree with the subject.*

(A) All birds are animals; therefore
What are not animals are not birds.

O, because, since you consider it as I, neither term is distributed, and the process is that of simple conversion.

(O) Some islands $\overset{Cop.}{\overline{\text{are not}}}$ fertile places; (first state this as I, by joining the negative to the pre-

* It is the same thing to *affirm* some attribute of the subject, and to *deny* the absence of it; thus (A) "All birds are animals," is equipollent to (E) "No birds are not-animals," which is of course simply convertible; "What are not animals, are not birds."

dicate, thus, "Some islands are | not-fertile-places," (*Pred.*) therefore—

Some places-not-fertile are islands.

You could not infer from the exposita, ("Some islands are not fertile places,") that "Some fertile places are not islands." Such a converse, indeed, would *accidentally* be true, but it would not follow from the form of expression. This will be seen by substituting other terms. E. G.

Some men | are not | poets; you cannot infer "Some poets are not men," but you *may* infer—

Some who are not poets are men.

34. To assist the memory in applying the two former methods of conversion, (viz. simple, and *per accidens,*) Aldrich, who does not notice conversion by negation, gives the following mnemonic line;

fEcI simpliciter, convertitur EvA per Acci.

For the last, we may say,

A sed, et O pariter, convertas usque Negando.

Or,

fAxO per Contra; sic fit conversio tota.

OF SYLLOGISMS.

35. The validity of a syllogism depends on this axiom of Aristotle, "Whatever is predicated of a

term distributed, (No. 16.) whether affirmatively or negatively, may be predicated in like manner of every thing contained under it." In the example at No. 4, X is predicated of Y distributed, and Z is contained under Y, *(i. e.* is its subject;) X is, therefore, truly predicated of Z.

36. There are two canons of pure categorical syllogisms; 1st, *Two terms that agree with one and the same third, agree with each other;* 2nd, *Two terms, of which one agrees and another disagrees with one and the same third, disagree with one another.* On the former of these canons rests the validity of *affirmative* conclusions; on the latter, of *negative.*

37. There are six rules for ascertaining whether the canons have been strictly observed or not.

Rule 1st. *Every syllogism has three, and only three, terms;* viz. the middle term, and the two terms of the conclusion, or question.* The *subject* of the conclusion is called the *minor term;*† its *predicate,* the *major term;* and the middle

---

* These are commonly called *Extremes.*

† Because generally of less extent than the major and middle terms.

term is that with which each of them is separately compared, in order to judge of their agreement or disagreement with each other.*

Rule 2nd. *Every syllogism has three, and only three, propositions;* viz. the *major premiss,* in which the *major term* is compared with the *middle;* the *minor premiss,* in which the *minor term* is compared with the *middle;* and the conclusion, in which the *minor term* is compared with the *major.*

Rule 3rd. *The middle term must not be ambiguous;*† which is the case whenever it is *equivocal,* or *undistributed.* An equivocal term is used in different senses in the two premises; E.G.

"*Sage* is a plant;
A philosopher is *sage;* therefore
A philosopher is a plant."

If a term be undistributed, as it then stands for a *part* only of its significates, it may happen that one of the extremes may have been compared with one part of it, and the other with another part: E.G.

---

* If there were two middle terms, the extremes not being both compared with the *same,* could not be conclusively compared with each other.

† If the middle term is ambiguous, there are, in reality, two middle terms in *sense,* though but one in sound.

"Apples are fruit;
Cherries are fruit; therefore
Cherries are apples."

The middle term, therefore, must be distributed once, at least, in the premises; *i. e.* by being the subject of a universal, or predicate of a negative.

Rule 4th. *No term must be distributed in the conclusion, which was not distributed in one of the premises;* because you would then employ the whole of a term in the conclusion, when you had employed only a part of it in the premiss; and thus, in reality, introduce a fourth term. The violation of this fourth rule is called an *illicit process* of the major or minor term; E. G.

*"All apples are fruit;
Cherries are not apples; therefore
They are not fruit." Illicit process of the major.

"All beasts of prey are carnivorous;
†All beasts of prey are animals; therefore
All animals are carnivorous." Illicit process of the minor.

---

* This is A, and no affirmatives distribute the predicate. The conclusion is E, and all negatives *do* distribute the predicate. (No. 20.)

† This also is A, and does not distribute the predicate.

Rule 5th. *From negative premises you can infer nothing;* for in them the middle term is pronounced to *disagree with both extremes,* not to *agree with both,* or to agree with one and *disagree* with the other: therefore they cannot be compared together; E. G.

"A fish is not a quadruped;"

"A bird is not a quadruped,"* proves nothing.

Rule 6th. *If one premiss be negative, the conclusion must be negative;* for in that premiss the middle term is pronounced to disagree with one of the extremes, and in the other premiss, (which must be affirmative by the preceding rule,) to agree with the other extreme; therefore, the extremes disagreeing with each other, the conclusion is negative. To prove a negative conclusion, one of the premises must be negative.†

"animals." The conclusion again is A, and *does* distribute the *subject*, "animals."

* In order to shew the disagreement between the terms "fish" and "bird," you must choose a middle term that agrees with one of them. E. G. "A feathered creature is not a fish; a bird is a feathered creature; therefore," &c. Or, "No animal that inhabits the water is a bird; a fish is an animal that inhabits the water; therefore," &c.

† To prove that the sun is not a planet, you must not

38. From these rules it is evident, first, that* *nothing can be proved from two particular premises;* and secondly,† that *if one of the premises be particular, the conclusion must be particular.*‡

---

take for a middle term "sphere," which agrees with both, but a middle term that disagrees either with "sun" or "planet." E. G. "Every planet describes an orbit; the sun does not describe an orbit; therefore it is not a planet." Or, "The sun is a fixed star; a planet is not a fixed star; therefore it is not the sun."

* You will then have either the middle term undistributed, or an illicit process. E. G. "Some animals are sagacious; some beasts are sagacious; therefore, some beasts are animals." Undistributed middle. This conclusion is true, but does not follow from the premises. The argument is of the same construction as the following absurdity: "Some animals are black; some hats are black; therefore, some hats are animals." Again, "Some animals are sagacious; some beasts are not sagacious; therefore, some beasts are not animals." Here is an illicit process of the major. "Some carnivorous creatures are tame; some beasts are not tame; therefore, no beasts are carnivorous creatures." This exhibits an illicit process of both the major and minor term.

† E. G. "All who fight bravely deserve reward; some soldiers fight bravely; therefore, some soldiers deserve reward." If you were to infer, "All soldiers deserve, &c." there would be an illicit process of the minor.

‡ The following mnemonic lines, from Aldrich, may assist the student in applying these rules and remarks;

39. From universal premises you cannot always infer a universal conclusion; E. G. "All gold is precious; all gold is a mineral; therefore some mineral is precious." But when you *can* infer a universal, you are always *at liberty* to infer a particular.

OF MOODS.

40. The mood of a syllogism is the designation of it according to the quantity (No. 11.) and quality (No. 11.) of each of its three propositions, which are denoted by the vowels A, E, I, O, (No. 17.). There are only eleven moods admissible, as conforming to the rules laid down at No. 37. *See No.* 44, *below.*

OF FIGURES.

41. The figure of a syllogism indicates the situ-

Distribuas medium (Rule 3.), nec quartus terminus adsit; (Rule 1 & 2.)

Utraque nec præmissa negans (Rule 5.), nec particularis; (No. 38.)

Sectetur partem Conclusio deteriorem; (Rule 6,& No. 38.)

Et non distribuat, nisi cum præmissa, negetve. (Rule 4 & 6.)

Logicians have attached to universal propositions an imaginary superiority over particulars, and to affirmatives a similar superiority over negatives. Hence the expression "pars deterior," meaning a particular or a negative proposition.

ation of the middle term with regard to the extremes of the conclusion, or *major and minor term.* (No. 37, Rule 1, and Note.) There are four figures.* In the first, the middle term is made *the subject of the major premiss, and the predicate of the minor:* in the second, the middle term is the *predicate of both premises:* in the third, *the subject* of both: in the fourth, it is *the predicate of the major premiss, and the subject of the minor.*

42. The major premiss of a syllogism is usually placed first, although, of course, the validity of the argument is not affected by the order of the two premises.

43. Each of the moods alluded to in No. 40, as admissible, will not be so in every figure; since, from the different position of the middle term, it may violate some of the foregoing rules in one figure, though not in another.†

---

* The first figure is the most natural and clear, and is at once open to the application of Aristotle's dictum. (No. 35.) The last is, in all respects, the very reverse of the first.

† I, A, I, for instance, is allowable in the third figure; because, in that figure, the middle term is made the subject of both the major and minor premiss. (No. 41.) It is, therefore, regularly distributed in the minor proposition A, (No. 20,) and as *neither* term is distributed in the conclusion I,

44. Although but eleven moods were stated to be admissible at No. 40, yet, since some of them occur in more than one figure, (as E, I, O, which

---

(No. 16, 20,) there can be no illicit process. (No. 37.) But I, A, I, is inadmissible in the first figure, because that figure demands that the middle term be made the subject of the major proposition I, and the predicate of the minor A. But I distributes neither term, and A, only the subject. (No. 20.) The middle term, therefore, being the subject of a particular, and the predicate of an affirmative, would be undistributed, contrary to rule, and no valid conclusion could follow. E. G.

I. Some arrogant men are learned;
A. All arrogant men are disagreeable; therefore
I. Some learned men are disagreeable.

The above is in the third figure, and valid. In the first figure, the same mood would be inadmissible, for the reasons above stated. E. G.

I. Some learned men are Englishmen;
A. The sages of Greece were learned men; therefore
I. Some of them were Englishmen.

So A, E, E, would, in the first figure, have an illicit process of the major; thus

A. Every fool is a sensualist;
E. No true philosopher is a fool; therefore
E. No true philosopher is a sensualist.

The major term, "sensualist," is not distributed in the major proposition, but is, in the conclusion. The same mood, in the second figure, is valid, because the major term "sensualist" is regularly distributed in the major proposition; E. G.

is found in all the four,*) each separate occurrence is reckoned as a new mood. From this recurrence of the same symbols in different figures, there are reckoned nineteen moods.

A. Every sensualist is a fool;
E. No true philosopher is a fool; therefore
E. No true philosopher is a sensualist.

Again, A, A, A, is allowable in the first figure;

A. All wicked men are miserable;
A. All tyrants are wicked men; therefore
A. All tyrants are miserable.

But, in the third figure, it would have an illicit process of the minor;

A. All wicked men are miserable;
A. All wicked men are tyrants; therefore
A. All tyrants are miserable.

The minor term, "tyrants," is not distributed in the minor premiss; but is, in the conclusion.

*A A A. Barbara.	A O O. Fakoro.
A A I. Darapti Bramantip.	E A E. Cesare, Celarent.
A E E. Camestres, Camenes.	E A O. Felapton, Fesapo.
A E O.	E I O. Ferio, Festino, Feriso
A I I. Darii, Datisi.	Fresison.
I A I. Disamis, Dimaris.	O A O. Dokamb.

A, E, O, is valid in the second figure, but useless, because it has a particular conclusion when you *might* draw a *universal* one in Camestres. E. G. (A.) Every X is Y. (E.) No Z is Y. (O.) Some Z is not X. You *might* say, *No* Z is X. (A.) "Every man is a sinner. (E.) No glorified spirit is a sinner. (O.) Some glorified spirit is not a man."

45. The vowels in the four following mnemonic lines are the symbols which denote the quantity and quality of the propositions. The consonants serve to keep in mind the figure of the syllogism.

Fig. 1. B*a*rb*a*r*a*, C*e*l*a*r*e*nt, D*a*r*ii*, F*e*r*io*que prioris;
Fig. 2. C*e*s*a*r*e*, C*a*mestr*e*s, F*e*st*i*no, F*a*k*o*r*o*, secundæ;
Fig. 3. Tertia, D*a*r*a*pt*i*, D*i*sam*i*s, D*a*t*i*s*i*, F*e*lapt*o*n, D*o*k*a*m*o*, F*e*r*i*s*o*, habet; quarta insuper addit
Fig. 4. Br*a*m*a*ntip, C*a*m*e*n*e*s, D*i*mar*i*s, F*e*s*a*p*o*, Fres*i*s*o*n.

46. It will assist the experiment of syllogisms in the different moods, if the letters X, Y, Z, are used as representatives of the different terms. Let X be the major, Y the middle, Z the minor.

SCHEME.

1st Fig.	*2nd Fig.*	*3rd Fig.*	*4th Fig.*
Y, X,	X, Y,	Y, X,	X, Y,
Z, Y,	Z, Y,	Y, Z,	Y, Z,
Z, X,	Z, X,	Z, X,	Z, X.

You *might* say, "No glorified spirit," &c. The same may be remarked of A, A, I, and E, A, O, in the first figure, and of E, A, O, in the second, as well as of A, E, O, in the fourth. See No. 39. These five moods, being useless, are without names.

By applying the moods *Barbara, Celarent, &c.* to the terms thus designated by the letters X, Y, Z, you may construct a short syllogism in every figure, and perceive how its validity is derived from an accordance with the six rules laid down above. No. 37.*

---

* Thus B*arba*ra, in which all the propositions are universal and affirmative, as the three A's denote.

B*ar*- "Every Y is X;
-b*a*- Every Z is Y;
-r*a*. Every Z is X."

C*elar*ent, in which the major is universal and negative, the minor universal and affirmative, and the conclusion universal and negative.

C*e*- "No Y is X;
-l*a*- Every Z is Y;
-r*e*nt. No Z is X."

D*arii*, in which the major is universal and affirmative, the minor particular and affirmative, and the conclusion the same.

D*a*- "Every Y is X;
-r*i*- Some Z is Y;
-*i*. Some Z is X."

F*erio*, in which the major is universal and negative, the minor particular and affirmative, and the conclusion particular and negative.

F*e*- "No Y is X;
-r*i*- Some Z is Y;
-*o*. Some Z is not X.

Apply the other moods C*esare* C*amestres*, &c. in the same way to the second figure; D*arapti*, &c. to the third; Bra

47.* Every proposition may be proved in the first figure, and all the moods in the three other figures reduced to it. See No. 53 *et seq.* below.

48. Four syllogisms, exemplifying one mood in each figure, are subjoined.

---

mantip, &c. to the fourth; carefully remembering the force of the symbols A, E, I, O, (No. 17.) The position of the Letters X, Y, Z, in the scheme, secures the learner against any mistake in placing the terms of each figure.

* It will be seen that A, or the universal affirmative, can be proved only in the first figure; as the second proves only negatives, (E, E, O, O,) the third only particulars, (I, I, I, O, O, O,) and the fourth only particulars or negatives. (I, E, I, O, O.) The first figure requires the major premiss to be universal, and the minor affirmative; the former, in order to distribute the middle term, and the latter, to avoid the fault of negative premises, (No. 37. Rule 5.) or to produce an affirmative conclusion. (No. 37. Rule 6.) The second figure proves only negatives, because the middle term, being the predicate in both premises, would not be distributed, unless one premiss were negative, (No. 20. Rule 2.) and therefore the conclusion must be negative. (No. 37. Rule 6.) The third proves only particulars, because the middle term being always the subject in the minor proposition, and that minor proposition being always affirmative, the minor term, as the predicate of an affirmative, cannot be distributed in its premiss, and therefore cannot be distributed in the conclusion.

Barbara. *Fig.* 1.

TERMS.

Major (X) One who deserves punishment.

Minor (Z) Every blasphemous writer.

Middle (Y) Every one who injures the public morals.

Bar- Every Y is X; All who injure the public morals deserve punishment;

-ba- Every Z is Y; All blasphemous writers injure the public morals; therefore

-ra. Every Z is X; All blasphemous writers deserve punishment.*

---

* The regular expression of the copula, *is* and *is not*, may always be preserved, if we disregard the clumsiness of the language; thus, the syllogism above may be stated as follows:

Bar- All who injure the public morals *are* persons deserving of punishment;

-ba- All blasphemous writers *are* persons who injure the public morals; therefore

-ra. All blasphemous writers *are* persons deserving of punishment.

Pupils should be able to state a proposition readily in this strict form.

49. *Cam*estres. *Fig.* 2.

TERMS.

Major (X) What is truly satisfactory.
Minor (Z) Guilty pleasures.
Middle (Y) What is unattended with remorse.

Cam- Every X is Y; Whatever is truly satisfactory is unattended with remorse;
-es- No Z is Y; No guilty pleasures are unattended with remorse; therefore
-tres. No Z is X. No guilty pleasures are truly satisfactory.

50. *Dar*apti. *Fig.* 3.

TERMS.

Major (X) What is entitled to respect.
Minor (Z) What is often ridiculed.
Middle (Y) True piety.

Da- Every Y is X; True piety is entitled to respect;
-rap- Every Y is Z; True piety is often ridiculed; therefore
-ti. Some Z is X. Something often ridiculed is entitled to respect.

51. *Camenes.* *Fig.* 4.

TERMS.

Major (X) A useful study.

Minor (Z) What is injurious to the morals.

Middle (Y) What is worthy of encouragement.

Cam- Every X is Y; All useful studies are worthy of encouragement;

-en- No Y is Z; Nothing worthy of encouragement is injurious to the morals; therefore

-es. No Z is X. What is injurious to the morals is not a useful study.*

52. The four moods of the first figure are called *fect;* all the rest, *imperfect.* When a syllogism in one of the imperfect moods is re-stated, and brought into the first figure, it is said to be *reduced.*

OSTENSIVE REDUCTION.

53. In reducing a syllogism, it is allowable to convert the premises illatively, (No. 31,) or to transpose them. This liberty renders it always possible to deduce, in the first figure, either the very same conclusion as the original one, or another, from which the original one is deducible by illative conversion.

* The method of statement in this figure is so clumsy and inverted, that it is seldom or never used. The propo-

54. The initial letters of the imperfect moods correspond with those of the four perfect ones, B, C, D, F, and indicate into which of them the imperfect mood is capable of being reduced. Thus *Bramantip* is to be reduced into *Barbara*, *Cesare* and *Camestres* into *Celarent*, *Festino* into *Ferio*, *&c.*

55. The letter *m*, occurring in the name of an imperfect mood, indicates that, in reducing it, the premises are to be transposed; *s*, that the proposition denoted by the vowel immediately preceding, is to be *converted simply* (No. 33.); *p*, that it is to be *converted per accidens* or limitation (No. 30.); (except in the case of *Bramantip*, where *p* denotes that the conversion of A *per accidens* has *already* taken place;*) *k*, that it is to be *converted* by *negation.* (No. 30.)†

---

sitions are easily reduced into the more natural arrangement of the first figure. See No. 54.

* E. G. Bram- All blasphemous writers injure the public morals;
-an- All who injure the public morals deserve punishment; therefore
-tip. Some who deserve punishment are blasphemous writers.

The conclusion is the converse *per accidens* of the conclusion of the Syllogism in Barbara, No. 48.

† The *Reductio ad impossibile* I have not thought it ne-

56. A few examples of reduction may suffice: *Camestres* is reduced to *Celarent,* as the initial letter directs, by simply converting the minor, (as is denoted by the *s* in *es,*) and then transposing the premises, (as is indicated by the *m* in *Cam.)* The conclusion of the reduced syllogism is the simple converse of the conclusion of the original one.

CAMESTRES. *See No.* 49.

Reduced to CELARENT.

Ce- What is unattended with remorse is not a guilty pleasure;

-la- Whatever is truly satisfactory is unattended with remorse; therefore

-rent. Whatever is truly satisfactory is not a guilty pleasure.

57. *Fakoro* is reduced to *Ferio* by converting the major by negation, (No. 30.) and considering

---

cessary to explain. Its object is, to show that an absurdity would follow from supposing the original conclusion to be false. When this mode of reduction is adopted, *Fakoro* and *Dokamo* are called *Baroko* and *Bokardo,* K being then the sign of the *Reductio ad impossibile.* But conversion by negation is by far the easier and more expeditious process.

the minor premiss affirmative; *i. e.* attaching the negative to the predicate instead of the copula. (No. 30.)

FAKORO.

Reduced to FERIO.

Fak- Every sincere Christian is charitable;

-o- Some professors of religion are not charitable; therefore

-ro. Some professors of religion are not sincere Christians.

Fe- He who is not-charitable is not a sincere Christian.

-ri- Some professors of religion are | not-charitable; | therefore (*Predicate.*)

-o. Some professors of religion are not sincere Christians.*

---

* *Fakoro* may be considered as *Festino*, and stated accordingly, by placing an equipollent negative Proposition for the major, (No. 33, Note,) and viewing the minor as an affirmative.

Fes- | No sincere Christian | (*Subject.*) is | not-charitable; | (*Predicate.*)

-ti- Some professors of religion are | not-charitable; | (*Predicate*) therefore

-no. Some professors of religion are not sincere Christians.

The minor premiss is here considered affirmative, because you take "not-charitable" as the middle term, and cannot separate the negative from it, without introducing a fourth term, contrary to No. 37, Rule 1.

58. *Darapti* is reduced to *Darii* by converting *per accidens* (No. 30.) the minor premiss. This is denoted by the *p* in *rap*. (No. 55.)

Festino is reduced to *Ferio* by simply converting the major; "He who is not charitable is not a sincere Christian," &c.

So *Dokamo* may be considered as *Disamis*, and stated accordingly, by joining the negative to the predicate instead of the copula, in the major and conclusion; *i. e.* viewing O as I;

Predicate.

Dis- Some desires are | not-blameable; |

-am- All desires are liable to excess; therefore

Predicate.

-is. Some things liable to excess are | not-blameable. |

Disamis is reduced to *Darii* by simply converting the major, and then transposing the premises.

Da- All desires are liable, &c.

-ri- Some things not blameable, &c.; therefore

-i. Some things not blameable, &c. as at No. 59.

DARAPTI. *See No.* 50.

Reduced to DARII.

Da- True piety is entitled to respect;
-ri- Something often ridiculed is true piety; therefore
-i. Something often ridiculed is entitled to respect.

59. *Dokamo* is reduced to *Darii* by converting the major by negation, and then transposing the premises.

DOKAMO.

Reduced to DARII.

Dok- Some desires are not blameable;
-am- All desires are liable to excess; therefore
-o. Some things liable to excess are not blameable.
Da- All desires are liable to excess;
-ri- Some things not blameable are desires; therefore
-i. Some things not blameable are liable to excess.

This conclusion is the converse by negation of the original one, (*i. e.* O converted into I,) and therefore, simply convertible into it. (No. 33.)

60. Those syllogisms are called Modal, that consist of modal propositions. (No. 12.) Modal propositions may be considered as pure categoricals, and stated accordingly. For this purpose, you should attach the mode to one of the terms; as, "The wisest man may possibly be mistaken."

Subj.	*Cop.*	*Pred.*
"The wisest man	is	one who may possibly be mistaken."

"It is probable that Livy was prejudiced; *i. e.*

Subj.	*Cop.*	*Pred.*
"Livy	was	probably prejudiced."

61. When the mode expresses only the necessary, impossible, or contingent connexion of the terms, you may attach it to the *subject*, as "Man is *necessarily* mortal;" *i. e.* "*All* men are mortal." "It is *impossible* for a bad man to be happy;" *i.e.* "*No* bad man can be happy."

62. It is often, however, most convenient to affirm simply the agreement or disagreement of the mode with the dictum, or assertion itself; as "I am possibly mistaken,"

Subj.	*Cop.*	*Pred.*
"That I am mistaken	is	possible."

In these cases, the subject implies that an entire act of judgment has previously taken place.

OF HYPOTHETICAL SYLLOGISMS.

63. A syllogism is called Hypothetical, when it contains one, two, or three hypothetical propositions; E. G. "If he is wise, he is happy; he is wise; therefore he is happy." Or, "He who is wise, is happy; if he is a philosopher, he is wise; therefore, if he is a philosopher, he is happy." Or, "If he is wise, he is happy; if he is a philosopher, he is wise; therefore, if he is a philosopher, he is happy." See No. 13. The hypothetical syllogisms most in use are divided into Conditional and Disjunctive. E. G.

CONDITIONAL.

If man is fallible, he is imperfect;
But he is fallible; therefore
He is imperfect.

DISJUNCTIVE.

It is either day or night;
But it is day; therefore
It is not night.

64. In a hypothetical syllogism, the reasoning

turns on the hypothesis, and the conclusion is always categorical.*

The hypothetical premiss is called the major, and the categorical one, the minor.

OF CONDITIONAL SYLLOGISMS.

65. It is to be observed of a conditional proposition, that it contains two, and only two, categorical propositions, whereof one results from the other; that from which the other results is called the Antecedent;* that which results from it, the Consequent *(Consequens.)* The connexion between the two (expressed by "if") is called the Consequence (*consequentia.*)

Consequentia. *Antecedent.* *Consequent.*

"If man is fallible, he is imperfect."

66. The truth or falsity of a conditional proposition depends entirely on the *consequence*, or *con-*

---

* When a hypothetical conclusion is drawn from a hypothetical premiss, the reasoning is, in effect, categorical. E.G.

Predicate.

Every conqueror is either a hero or a villain;
Cæsar was a conqueror; therefore

Predicate.

He was either a hero or a villain.

* The antecedent is sometimes placed *after* the consequent. We might say, "Man is imperfect, if he is fallible."

nexion between antecedent and consequent. Both antecedent and consequent may be false, yet if there be such a connexion between them, that the falsity* of the antecedent *depends* on the falsity of the consequent, the whole proposition is valid. E. G.

Antecedent.

If | logic is useless, |

Consequent.

| it deserves to be neglected. |

On the other hand, both antecedent and consequent may be *true;* yet if there be no connexion between them, so that the latter does not depend for its truth on the former, the whole proposition is *false; i. e.* the consequent does *not follow* from the antecedent.

Antecedent.

If | Virgil was a poet, |

Consequent.

| he wrote the Æneid. |

It is true both that Virgil was a poet, and that he

* If you deny the consequent, "Logic deserves to be neglected," the falsity of the antecedent, "Logic is useless," must follow. This will appear from a categorical statement of the proposition. (A) "Whatever is useless is deserving of neglect." Convert this by negation. (E) "Whatever is not deserving of neglect is not useless. (No. 30.) Logic is not deserving of neglect; therefore it is not useless."

wrote the Æneid, but it does not follow that *because* he was a poet, he *therefore* wrote the Æneid.

67. There are two rules for drawing a conclusion from a conditional proposition. Rule 1. *The antecedent being granted, the consequent may be inferred*; E. G.

"If A is B, C is D; Major. "If rain has fallen, the ground is wet;

But A is B; Minor. But rain has fallen;

therefore therefore

C is D." Conclusion. The ground is wet."

These syllogisms, in which the antecedent is granted, are called *Constructive.*

Rule 2. *The consequent being denied, the antecedent may be denied.*

"If A is B, C is D; "If rain has fallen, the ground is wet;

But C is not D; therefore But the ground is not wet; therefore

A is not B." Rain has not fallen."

These syllogisms, in which the consequent is denied, are called *Destructive.*

68. By *denying* the *antecedent,* or *affirming* the *consequent,* nothing can be inferred, because the same consequent may follow from *other* antece-

dents. *Rain may not have fallen, and yet the ground may be wet; or †the ground may be wet, and yet no rain have fallen; because dew or an inundation would produce the same effect.‡

OF DISJUNCTIVE SYLLOGISMS.

69. To what has been said of a disjunctive pro-

---

* Here the antecedent is denied.

† Here the consequent is affirmed.

‡ Conversion by negation (No. 30) is applicable to conditional propositions; *i. e.* the contradictory of the consequent may be taken for the antecedent, and the contradictory of the antecedent for the consequent.

"If rain has fallen, the ground is wet;
But rain has fallen; therefore
The ground is wet." } Constructive.

"If the ground is not wet, rain has not fallen;
But rain has fallen; therefore
The ground is wet." } Destructive.

By this conversion of the major premiss of a constructive syllogism, (the minor, of course, remaining unchanged,) you will reduce a constructive syllogism into a destructive, because you deny the consequent. You will reduce a destructive syllogism into a constructive, because you affirm the antecedent. E. G.

"If rain has fallen, the gound is wet;
But the ground is not wet; therefore
Rain has not fallen." } Destructive.

"If the ground is not wet, rain has not fallen;
But the ground is not wet; therefore
Rain has not fallen." } Constructive

sition (No. 13) must be added, that it consists of two or more categoricals so stated, as to imply that *some one* of them, at least, is true, and generally that *but one* can be true; as, "It is either day or night."

70. By denying one of the categoricals of a disjunctive proposition, if there be but two, you may infer the truth of the remaining one; as, "It is either day or night: but it is not day; therefore it is night." By denying one of them, if there be several, you may infer the truth of *some one* of the remaining ones; as, "It is either Spring, Summer, Autumn, or Winter; but it is not Spring; therefore it is either Summer, Autumn, or Winter.' By denying all but one, you will infer the truth of that one; as, "It is neither Spring, Summer, nor Autumn; therefore it is winter."

71. When it is implied that only one of the categoricals can be true, by *affirming* one, you, of course, deny the rest. As, "It is either Spring, Summer, &c.; but it is Spring; therefore it is neither Summer, Autumn, nor Winter."*

* If *both* categoricals should be true, it is plain that the affirmation of one cannot imply the denial of the other; as, "Amphibious creatures live either on land or in the water."

72. The dilemma* is a redundant conditional syllogism, with two or more antecedents in the major premiss, and a disjunctive minor.

73. Dilemmas are either Constructive or Destructive. Of the constructive dilemma there are two sorts, *Simple* and *Complex*. There is but one sort of the true destructive dilemma.

74. The simple constructive dilemma has but *one consequent* to each antecedent. The antecedents being disjunctively granted, in the minor, the common consequent is inferred. See No. 67. Rule

	Major.	
1.	"If A is B, C is D; and if E is F, C is D.	
	Minor.	*Conclusion.*
	But either A is B, or E is F;	therefore C is D."

"If a Christian be living, he is the Lord's servant; and if he be dead, he is the Lord's servant; but he

---

*As, in this kind of argument, there are generally, in the major premiss, two antecedents, which, in the minor, become two assumptions, it is termed a *dilemma*, from δὶς *twice, two*, and λῆμμα, *an assumption*. It is called by the lexicographers, "Syllogismus ab utrâque parte feriens adversarium," and "Argumentum cornutum," because most horned animals have *two horns*, and there are, in a dilemma, *two instruments of attack*, furnished in the two assumptions. So Cowley, "Both the horns of fate's dilemma wound."

must be always either living or dead; therefore he is always the Lord's servant." (See *Romans*, xiv. 8.)*

75. The complex constructive dilemma has a different consequent to each antecedent. The antecedents are disjunctively granted, in the minor, and the different consequents disjunctively inferred.

E.G. | "If A is B, C is D, and if E is F, G is H; | *Major.* | but either A is B, or E is F; | *Minor.* | therefore either C is D, or G is H." | *Conclusion.* "If the Evangelists speak truth, Christianity is of God, and if they do not speak truth, the existence of Christianity is perfectly unaccountable; but the Evangelists either do or do not speak truth; therefore Christianity is either of God, or its existence is perfectly unaccountable."

76† The true destructive dilemma has, like the

---

* The conditionals of the major premiss may be united by the adverb "whether," so as to form one proposition; E. G. "Whether a Christian lives or dies, he is the Lord's servant."

† There is a form of argument incorrectly styled a destructive dilemma, in which the consequents are *wholly*

complex constructive, a different consequent to each antecedent, in the major. The consequents are disjunctively denied, in the minor, and the antecedents disjunctively denied, in the conclusion. E.G. "If A is B, C is D, and if E is F, G is H; but either C is not D, or G is not H; therefore either A is not B, or E is not F."—"If a witness be an honest one, he will not bear false testimony

---

instead of *disjunctively*, denied in the minor. This is, however, a mere combination of *simple* conditional syllogisms, two or more being expressed together. It may consist either—1st, of one antecedent with several consequents; or, 2ndly, of several antecedents with one consequent; or, 3rdly, of several antecedents with several consequents. 1st, If A is B, C is D; if A is B, E is F; if A is B, G is H; but C is not D, E is not F, G is not H; therefore A is not B. 2ndly, If A is B, C is D; if E is F, C is D; if G is H, C is D; but C is not D; therefore A is not B, E is not F, G is not H. 3rdly, If A is B, C is D; if E is F, G is H; if I is K, L is M; but C is not D, G is not H, L is not M; therefore A is not B, E is not F, I is not K. Should you, in the first case, deny the consequents *disjunctively* instead of *categorically*, you will not thereby make the argument a dilemma; for if *all* the consequents be not true, the *one antecedent* must fall to the ground. E. G. "If A is B, C is D; if A is B, E is F; if A is B, G is H; but either C is not D, E is not F, or G is not H; therefore A is not B. But in the correct destructive dilemma there is always a *disjunctive conclusion*.

designedly; and if he be a competent one, he will not do so undesignedly: but a witness who speaks false, does so either designedly or undesignedly; therefore he is either not honest or not competent."

77. The dilemma may always be reduced into simple conditional syllogisms, by adding a categorical minor to each antecedent and consequent of the major premiss of the dilemma. On such a statement, it will be seen that an opponent could not deny *both* the minors, and that he must, therefore, admit *one* of the conclusions.

78. In a constructive dilemma, some one of the antecedents is assumed to be true; and, in a destructive, some one of the consequents assumed to be false; but *which*, is left undetermined.

REDUCTION OF HYPOTHETICAL SYLLOGISMS.

79. To reduce a hypothetical syllogism into a categorical form, you must view every conditional proposition as a universal affirmative, taking the antecedent for the subject, and the consequent for the predicate.

Anteced.	*Conseq.*		*Subject.*		*Predicate.*
If A is B,	C is D;	Bar-	The case of A being B	is	the case of C being D;
But A is B;	therefore	-ha-	The present case is that of A being B;		therefore
C is D.		-ra.	The present case is that of C being D.		
Anteced.	*Conseq.*		*Subject.*		*Predicate.*
If A is B,	C is not D;	Cam-	The case of A being B,	is	the case of C not being D;
But C is D;	therefore	-es-	The present case is not the case of C not being D;		
A is not B.			therefore		
		-tres.	The present case is not the case of A being B.		

Camestres may, of course, be reduced to *Celarent*. But even destructive conditionals may be stated in *Barbara*, if you view them as constructive; which is done by converting by negation the major premiss. (See No. 68, *Note.*) This process of reduction, however, is explained merely to show the applicability of Aristotle's dictum to every form of argument; since the rules for hypothetical syllogisms are a sufficient test of their validity.

ENTHYMEMES.

80. The Enthymeme is a syllogism, with one of the premises omitted. This premiss is easily supplied by comparing the middle term with that term of the conclusion which is expressed *only once*. E. G.

"Isaiah was a prophet; therefore
He was inspired."

The middle term, of course, is that which does not enter into the conclusion, viz. "Prophet." —"Isaiah," or the minor term, is expressed *twice*. "Inspired," the major term, *only once*. Compare, therefore, the middle term with the major, thus supplying the major premiss; E. G.

"Every prophet is inspired;
Isaiah was a prophet; therefore
He was inspired."

If the minor premiss had been suppressed, the minor term "Isaiah" could have occurred *only once*. E. G.

"Every prophet is inspired; therefore
Isaiah was inspired."

You must, in that case, have taken the minor term "Isaiah" for comparison with the middle, thus supplying the minor premiss.*

81. By taking the two propositions of an enthymeme for an antecedent and consequent, you may form it into a conditional syllogism; E. G. "If Isaiah was a prophet, he was inspired."

OF THE SORITES.

82. A Sorites* is a brief form of connecting several syllogisms in the first figure. In a sorites, the predicate of the first proposition is made the

---

* This is the ordinary way of speaking and writing, and in this concise form we continually reason in our minds, ἐν θυμῷ. Hence the term Enthymeme.

† From σωρὸς, a pile; because the propositions are *piled*, as it were, one on another.

subject of the next, and so on, to any length, till finally the predicate of the last of the premises is predicated, in the conclusion, of the subject of the first.

A is B;	Religion improves the morals;
B is C;	What improves the morals is beneficial to the community;
C is D; therefore	What is beneficial to the community deserves encouragement; therefore
A is D;	Religion deserves encouragement.

83. In a sorites, there are as many middle terms as there are intermediate propositions between the first and last; the subject of each intermediate proposition being a middle term. A sorites may, therefore, be drawn out into as many separate syllogisms as there are intermediate propositions.

84. In drawing out a sorites into distinct* syllogisms, you must take for your major premiss the *first intermediate* proposition of the sorites, and

---

* By *distinct* and *separate* syllogisms, I mean those *in form*, with major, minor, and conclusion, into which the sorites may be expanded.

for your minor premiss, the *first* proposition of it; then draw your conclusion. The major proposition of your next syllogism must be the *second intermediate proposition* of the sorites, and your minor proposition must be the conclusion of your preceding syllogism; thence draw your second conclusion. Proceed thus till you have formed as many distinct syllogisms as the sorites contains intermediate propositions, and have arrived at the same conclusion. The sorites gives you only the *first* minor premiss, viz. in its first proposition. All the other *minor* premises consist of the conclusions of your separate syllogisms. All your *major* premises consist of the intermediate propositions of the sorites. E. G.

Intermediate Propositions.

"A is B, | B is C, C is D, D is E, | therefore A is E." Here is a sorites with three intermediate propositions, to be drawn out into three distinct syllogisms.

Syll. 1.	*Syll.* 2.	*Syll.* 3.
B is C;	C is D;	D is E;
A is B; therefore	A is C; therefore	A is D; therefore
A is C.	A is D.	A is E.

85. In a sorites, the *first* proposition alone (except, of course, the conclusion) may be *particular;* because the first proposition is made the minor of the distinct syllogism (No. 84) and may be particular, according to rule, (either Dar*i*i, or Fer*i*o.) The intermediate propositions being all majors of the distinct syllogisms, must be universals. (B*a*rbara, C*e*larent, D*a*rii, F*e*rio.)

86. The last premiss of the sorites (viz. the last intermediate proposition) is the only one that can be negative;"* because the last premiss alone never gives occasion to employ the conclusion of the distinct syllogism as the minor of a subsequent one. Should any other premiss of the sorites but the last be negative, it would lead to a negative conclusion, (No. 37, Rule 6,) and that conclusion, being made the minor of the following syllogism, would violate the first figure, which does not admit of a negative minor premiss. (Barb*a*ra, Cel*a*rent, Dar*i*i, Fer*i*o.)

87. A hypothetical sorites consists of a series of hypothetical syllogisms. In the constructive hy-

* Should a sorites *appear* to have a negative premiss before the last, the succeeding premiss will shew that the negative is, in reality, a part of one of the terms.

pothetical sorites, you proceed from the establishment of the first antecedent to the establishment of the last consequent. E. G.

If A is B, C is D; If it is the duty of a parent to take care of his children, he should keep them, as much as possible, from vice;

If C is D, E is F; If he should keep them from vice, he ought to teach them what is virtuous;

If E is F, G. is H; If he ought to teach them what is virtuous, he is bound to instruct them in religious knowledge;

But A is B; therefore G is H. But it is the duty of a parent to take care of his children; therefore He is bound to instruct them in religious knowledge.

In a destructive sorites, you go back from the denial of the last consequent, to the denial of the first antecedent; "G is not H; therefore A is not B."

"If Romish councils speak the truth, popery should be credited;

If popery should be credited, protestantism is fallacious;

If protestantism is fallacious, the Scriptures are not the rule of faith;

But the Scriptures are the rule of faith; therefore

Romish councils do not speak the truth."

OF INDUCTION.

88. Induction* is a kind of argument, which infers, respecting a whole class, what has been ascertained respecting one or more subdivisions of that class; or the drawing a general conclusion from as many particular instances as can be *brought in* to bear on the point in question; as if, on perceiving that the ox, sheep, deer, goat, and antelope, all ruminate, you should infer that *all horned animals* ruminate. Inductive arguments, which are usually stated as enthymemes,† (No. 80.) are, of course, easily filled up, so as to become regular syllogisms.

---

* The term "Induction" is sometimes employed to designate the process of investigating and collecting facts; which is not a process of argument, but a *preparation for it.*

† The example given by Dr. Aldrich is inconveniently stated for reduction into a syllogistic form, a circumstance

EPICHIREMA.

89. One of the premises of a syllogism is occasionally confirmed by an incidental proposition, called a Prosyllogism. This proposition, with the premiss it is attached to, form an enthymeme. (No. 80.) The *incidental* proposition is the *expressed premiss* of the enthymeme, and the premiss it is attached to is the *conclusion*. E. G.

"All sin is dangerous;
Covetousness is sin; (for it is a transgression of the Law;) therefore
It is dangerous."

---

which, perhaps, occasioned his error, (pointed out by Dr. Whately,) in directing the student to supply the minor, instead of the major, premiss of the enthymeme; "Hic et ille et iste magnes trahit ferrum; ergo omnis." The real subject here is, "ferrum trahere," the real predicate, "proprium hujus et illius et istius magnetis." The term expressed *but once* will be the major, "proprium omnis," which must therefore be compared with the middle, (No. 80.) viz. "proprium hujus, et illius, et istius magnetis."

Middle Term.
"What belongs to this, that, and the other magnet, is
Major Term.
what belongs to all;
Minor Term. *Middle*
The power of attracting iron is what belongs to
Term.
this, that, and the other magnet; therefore
Minor Term. *Major Term.*
The power of attracting iron is what belongs to all."

The minor premiss is an enthymeme; "Covetousness is a transgression of the law; therefore it is sin." A syllogism with such a premiss is called an Epichirema. (ἐπιχειρέω, I undertake to prove.)

EQUIVALENTS.

90. Equivalent terms are allowable for brevity's sake, as the pronoun for the noun; equivalent propositions are also allowable, as the illative converse for the exposita; (No. 30 *et seq.*) and such equivalents as may be supplied by ranking species under genus, &c.

IRREGULAR SYLLOGISMS.

91. The premises of a valid syllogism may appear negative, contrary to Rule 5, No. 37. One of the premises should then be stated as an affirmative. (See *Note* to No. 33, "It is the same," &c.)

"No one is wise who is not virtuous;
No gamester is virtuous; therefore
No gamester is wise."

The real middle term in this syllogism is, "not-virtuous," and it is in *Celarent*.

"He who is not-virtuous is not wise;
A gamester is not-virtuous; therefore
He is not wise."

92. From the variety of expression admissible in language, the logical order of subject and predicate is often inverted; and this will occasion the appearance of too many terms in the syllogism. All that is requisite, in such cases, is to restore the subject and predicate to their proper order. E.G.

"No irrational agent could produce a work which manifests design;

The universe is a work which manifests design; therefore

No irrational agent could have produced the universe."

Strictly considered, this syllogism has five terms, viz. 1. An irrational agent. 2. A being, able to produce a work which manifests design. 3. The universe. 4. A work which manifests design. 5. A being, able to produce the universe.

"[A work which manifests design] [could not be produced by an irrational agent;]

[The universe] is [a work which manifests design;] therefore

[It] [could not be produced by an irrational agent."]

93. The above irregularity is sometimes accompanied with a transposition of the premises, as in the following syllogism, which appears to be in the second figure, and faulty, from an affirmative conclusion. (*Note* to No. 47.)

"Every true patriot is disinterested;
Few men are disinterested; therefore
Few men are true patriots."

It is, in reality, *Barbara,* with a transposition of the premises, and of the terms of the major proposition; for you do not predicate of "few men," that they are "disinterested," but of "disinterested men," that they are "few."

"Disinterested men are few;
True patriots are disinterested men; therefore
True patriots are few."

94. By the use of conversion and equipollent propositions, such irregularities as the following are easily reduced to form.

"None but candid men are good reasoners;
Few infidels are candid; therefore
Few infidels are good reasoners."

The major premiss here is equipollent to "They who are not candid men are not good reasoners," which is the converse by negation of "All good reasoners are candid men." (No. 30.) State your

major proposition in A accordingly. The minor premiss and the conclusion are equipollent to "Most infidels are not candid;" therefore "Most infidels are not good reasoners." This will be a regular syllogism in *Camestres* or *Fakoro;** or it may be stated at once in *Celarent,* or *Ferio.*

"They who are not candid (or uncandid)
Copula
| are not | good reasoners;
Most infidels *Copula* | are | not candid; (or uncandid;)
therefore
Most infidels *Copula* | are not | good reasoners."†

---

* I have said *Camestres* OR FAKORO, and *Celarent* OR FERIO, because "most" cannot designate *absolute* universality, though the present case may be thought to amount to a *moral* one. (See *Note* to No. 15, and UNIVERSALITY, in the Index.)

† For the attainment of skill in syllogizing, as in every other intellectual process, true it is, that "sapere est et principium et fons." Without good sense and some command of expression, it will often be very difficult for a student to state, *in form,* many arguments that are sufficiently conclusive. On the other hand, some proficiency in logic, as an *art,* is essential to the ready performance of this exercise, however simple it may appear. Though good sense and command of expression are indispensable, they are not, of themselves, sufficient. A study, then, which both tries the faculties of the *mind,* and calls into play the resources of *phraseology,* is surely to be considered as worthy of a place in the scheme of a liberal education.

EXERCISES.

Add the proper Symbols to the following Propositions.

1. All grief is mitigated by time. (No. 15.)
2. Some troubles happen to all. (No. 15.)
3. No deceit is justifiable. (No. 15.)
4. Reverence is due to God. (No. 19.)
5. Some virtuous men have been unfortunate.
6. A dissipated character is not estimable. (No. 19.)
7. Many ingenious men have not acquired a reputation. (No. 15.)
8. The rose soon fades. (No. 19.)
9. Alexander was the son of Philip. (No. 11, *note.*)
10. Herodotus is not to be implicitly believed.
11. Few men are acquainted with themselves. (No. 15, *note.*)
12. Sin is necessarily destructive of happiness. (No. 12, *note.*)
13. Every animal is either rational or irrational. (No. 13.)
14. There is no one free from faults. (No. 15.)
15. Rome was the mistress of the world.

16. "Thou art the man."

17. Reading improves the mind. (No. 19.)

18. The Chinese are an idolatrous people. (No. 11, *note.*)

19. Romulus and Remus were twins.

20. If a man be a diligent student, he will become learned. (No. 13.)

21. Every mistake that a man makes is not a sign of folly. (No. 15.)

22. All men have not great abilities.

23. None but classical scholars can fully appreciate the beauties of ancient literature. (No. 15.)

24. "None is lost but the son of perdition."

State the Contraries and Contradictories of the following Propositions. (*No.* 27.)

25. No men are immortal.

26. No conscientious person is deserving of ridicule.

27. All falsehood is dangerous.

28. Every real Christian is charitable.

29. Dishonesty deserves to be punished.

30. Nothing past can be recalled.

31. All who know what is right are bound to practise it.

32. Not one of the enemy escaped.

How, in respect of quantity, is the contradictory of each of the above propositions related to the contrary?

State the Subcontraries and Contradictories of the following Propositions.

33. Some evils are inseparable from a state of mortality.

34. Many apparent misfortunes are real blessings.

35. Several writers of merit have not been popular.

36. All do not admire the same things.—*Hor.*

37. Some men are eager for novelty.

38. Many critics are not candid judges.

39. Few can distinguish between what is really good and evil.—*Juv.*

40. All the hexameters of Virgil are not completed.

---

41. No miser is contented.

What is the symbol of this proposition? (No. 17.) Is its simple converse true? (No. 33, or 34.)

42. Some misfortunes are unavoidable.

Add the symbol. What is the contradictory? Is it true or false? (Nos. 26, 27, 28.) What is the

simple converse of the contradictory? Is it true or false? What is the contradictory of the simple converse? How may this be changed into the exposita? (No. 30.)

43. No good man is a liar.

Add the symbol. What is the simple converse? Is it true? (No. 33.) What is the subalternate of the simple converse? (Nos. 24, 27.) How might the exposita be changed into this? (No. 33.)

44. All earthly things are perishable.

Add the symbol. What is the subalternate? Is it true? (No. 28.) What is the simple converse of the subalternate? Is it true? How might the exposita be changed into it? No. 30.)

EXERCISES ON SYLLOGISM, ETC.

45. Swearing is forbidden by our Saviour; swearing is practised in our Courts of Justice; therefore something practised in our Courts of Justice is forbidden by our Saviour.

Is this fallacious? See the Church Articles; also (Nos. 19 and 37, Rule 3.)

46. Hypocrisy is injurious to the interests of religion; ill-directed zeal is often taken for hypocrisy; therefore it is injurious to the interests of religion.

Is the conclusion true? Does it follow? Why? (No. 37, Rule 1.)

47. Covetousness is idolatry; to worship graven images is idolatry; therefore it is covetousness. (No. 37, Rule 3.)

48. No bribery is defensible; bribery is not idleness; therefore idleness is not defensible. (No. 37, Rule 5.)

Is the conclusion true? Does it follow? Why?

49. Mathematical study improves the reasoning powers; the study of logic is not mathematical study; therefore it does not improve the reasoning powers. (No. 37, Rule 4.)

50. Whatever is sinful is productive of sorrow; fraud and revenge are sinful, and poverty deprives us of many comforts; therefore fraud, revenge, and poverty are all productive of sorrow. (No. 37, Rule 2.)

51. Some sins are not malicious; calumny is a sin; therefore it is malicious. (No. 37, Rule 6, and 3.)

52. All luxury is sinful; all luxury is agreeable to the bodily sense; therefore whatever is agreeable to the bodily sense is sinful. (No. 37, Rule 4.)

53. No religious man is factious; St. Paul was a religious man; therefore he was not factious.

What mood and figure? (Nos. 41, 45.)

54. Some vicious pastimes are permitted by law; every vicious pastime is disgraceful to a Christian; therefore something disgraceful to a Christian is permitted by law.

What mood and figure? How reducible? Could you say, "Every thing disgraceful to a Christian is permitted by law?" Why? (No. 37. Rule 4.)

55. No men are free from sin; every one free from sin is the servant of God; therefore some servants of God are not men.

What mood and figure, and how reducible?

56. Whoever winneth souls is wise; all who preach the Gospel faithfully win souls; therefore some who preach the Gospel faithfully are wise.

Has this mood any name? What conclusion might you draw? (No. 44, *note*.)

57. No wicked people enjoy peace of mind; all who have gained riches dishonestly are wicked people; therefore some who have gained riches dishonestly do not enjoy peace of mind.

Is this valid? What is the name of the mood? State the *subalternans* of the conclusion. (No. 44, *note*, and No. 24.)

58. If Roman history is credible, the Carthaginians were a treacherous people; Roman history is credible; therefore the Carthaginians were a treacherous people. (No. 67.)

59. St. Matthew's Gospel is allowed to have been first written either in Greek or Hebrew; Erasmus thought it was not first written in Hebrew; therefore he thought it was first written in Greek. (No. 71.)

60. All parts of Scripture are written for our learning; some dreadful narratives are parts of Scripture; therefore some dreadful narratives are written for our learning.

What mood and figure?

61. Every candid man acknowledges merit in a rival; every learned man does not acknowledge merit in a rival; therefore every learned man is not candid.

What are the quantity and quality of the minor premiss and the conclusion? (No. 15.) What mood and figure? Reduce the syllogism.

62. All earthly projects are liable to disappointment; nothing liable to disappointment should engage our chief concern; therefore something that should engage our chief concern is not an earthly project.

Might you substitute the *subalternans* of the conclusion? In what mood and figure would the syllogism then be?

63. Immoral companions should be avoided; some immoral companions are intelligent; therefore some intelligent persons should be avoided. (No. 19.)

State the mood, figure, and mode of reduction.

64. If the world were good, laws would be useless; but laws are not useless; therefore the world is not good. (No. 67, Rule 2.)

65. If the world were good, laws would be useless; but the world is not good; therefore laws are not useless.

Is this conclusive? Why? (No. 68.)

66. Make a disjunctive syllogism from 2 *Samuel*, xxiv, 13.

67. What sort of proposition is it in *Luke* xvi, 30? Can you make of it a valid syllogism? Which is the *Consequentia?* (No. 65.)

68. If I am blest with opulence, I have reason to be thankful; but I am not blest with opulence; therefore I have no reason to be thankful. (No. 68.)

69. If I am blest with opulence, I have reason

to be thankful; but I have reason to be thankful; therefore I am blest with opulence.

70. Every vicious amusement is unbecoming a wise man; no philosophical pursuits are unbecoming a wise man; therefore some philosophical pursuits are not vicious amusements.

In what figure is this syllogism? The mood?

71. If a proposition be a particular affirmative, shew to what sorts of propositions it cannot belong. Prove this by a syllogism. (No. 71.)

72. The Helvetii, if they went through the country of the Sequani, were sure to meet with various difficulties; and if they went through the Roman province, they were exposed to the danger of opposition from Cæsar; but they were obliged to go one way or the other; therefore they were either sure of meeting with various difficulties, or exposed to the danger of opposition from Cæsar.—*De Bello Gallico, lib.* i. 6.

What sort of argument is this? (No. 75.) Reduce it into simple syllogisms. (No. 77.)

73. This man has been proved treacherous; therefore he is not to be trusted.

What sort of argument? supply the premiss. (No. 80.)

74. If pain is violent, it should be borne with patience, because it will be of short continuance; and if it be slight, it should be borne with patience, because it is only a small evil; but pain must be either violent or slight; therefore it should be borne with patience.

What sort of argument? (No. 74.) What do you call the two incidental propositions in the major premiss? (No. 89.)

75. No woman of great mind would submit to the indignity of being led in triumph; therefore Cleopatra would not.

What sort of argument? Supply the premiss.

76. Our heavenly Father is merciful; therefore we should be merciful.*

77. Alexander was buried; he who is buried becomes dust; what becomes dust is earth; earth is probably made loam; what is probably made loam might probably stop a beer-barrel; therefore Alexander might probably stop a beer-barrel. See *Hamlet, Act* V, *Scene* 1.

---

* In supplying the deficient premiss, the strict form of syllogism will be better preserved, if we state the above propositions thus: "To be merciful is a quality of our heavenly Father; therefore it should be ours." (No. 80.)

What sort of argument? Into how many distinct syllogisms may it be expanded, and why? State it in this form. (Nos. 82, 83, and 84.)

78. None but pious men are fit for the priesthood; some ignorant men are pious; therefore some ignorant men are fit for the priesthood.

Is this valid? Why? (No. 15, and No. 37, Rule 3.)

79. None but the truly penitent are pardoned; the malefactor mentioned by St. Luke (ch. xxiii.) was truly penitent; therefore he was pardoned.

Is this conclusion true? Does it follow from the premises? What major proposition does the conclusion require?

80. If man is responsible for his actions, he ought to live circumspectly; if he ought to live circumspectly, he should consider what is his duty; if he should consider what is his duty, it concerns him to seek the will of God; if it concerns him to seek the will of God, he ought to study the holy Scriptures; but man is responsible for his actions; therefore it is incumbent on him to study the holy Scriptures.

What sort of argument? to which division does

it belong, and why? (No. 87.) How could it be changed, so as to fall under the other division? Would the proposition, in that case, be true?

81. All great poets are men of genius; Cicero was a man of genius; therefore he was a great poet. (No. 37, Rule 3.)

82. Opulence is seen, in such a multitude of instances, to harden the heart and to engross the soul, that we might conclude, even without the authority of Scripture, that the rich enter with difficulty into the kingdom of Heaven.

What sort of argument? (No. 88.)

83. Whatever tends to withdraw the mind from pursuits of a low nature deserves to be promoted; classical learning does this, since it gives us a taste for intellectual enjoyments; therefore it deserves to be promoted.

What name is given to such a syllogism as this? Which is the prosyllogism? Which premiss is of itself an enthymeme? (No. 89.)

84. A negro is a fellow-creature; therefore he who injures a negro injures a fellow-creature.*

---

* This kind of argument, though not formal, is so obviously valid, that it were a waste of time to expand it into

85. No virtuous man is malevolent; all detractors are malevolent; therefore some detractors are not virtuous.

86. He is brave who conquers his passions: he who resists temptation conquers his passions; therefore he who resists temptation is brave.

87. All the ships that sailed to Troy, contained, probably, 100,000 men; the ship of Nireus was one of these; (Il. B. 671.) therefore it probably contained 100,000 men. (No. 37, Rule 3. See FALLACIÆ, in the Index.)

88. Somebody must obtain the high prize in every lottery; each individual who holds a ticket is somebody; therefore each individual who holds a ticket must obtain the high prize. (No. 37, Rule 3.)

---

syllogisms. It will be found to rest upon the general principle, that whatever stands in any relation to an individual or species, bears the same relation to a part of any class or predicable which comprehends that individual or species. E. G. "What stands in any relation to the species 'Negro,' bears the same relation to the predicable, 'Fellow-creature,' which comprehends the species 'Negro;' he who injures a 'Negro,' stands in a relation to the species 'Negro,' therefore he who injures a 'Negro,' bears the same relation to the predicable, 'Fellow-creature,' which comprehends the species 'Negro.'"

89. Sticks are easily broken; fagots are sticks; therefore fagots are easily broken. (No. 37, Rule 3.) See FALLACIÆ, in the Index.

90. Books are a source both of instruction and pleasure; the Iliad and Odyssey are books; therefore they are a source both of instruction an pleasure. (No. 19, No. 37, Rule 3.)

INDEX AND VOCABULARY.

ABSOLUTE *Noun*, or *Term*, See TERM.

ABSTRACT *Noun*, or *Term*, See Term.

ABSTRACTION, the process by which we draw off, in thought, from a notion, any circumstances we do not purpose to consider. By this process generalization is performed.

ACCIDENT, a predicable *contingently* joined to the essence of the species, and which may, therefore, be absent or present, the essence of the species remaining the same; as, "A man *walking*," "A man *born at Paris*." The former is called a *separable* accident, because it may be separated from the individual; the latter is plainly *inseparable*. Accident is predicated in *Quale*. See SPECIES.

ACCIDENTAL DEFINITION, See DEFINITION.

ANALOGOUS *Words* or *Terms*, See WORDS.

ANTECEDENT, No. 65.

APPREHENSION, *Simple*, one of the three operations of the mind concerned in argument. The notion of any object in the mind. It is either *Incomplex* or *Complex*. See OPERATIONS.

APPREHENSION, *Simple Incomplex*, the notion of one object, as, "A pen," or of several objects confusedly and without any relation, as, "Pens."

APPREHENSION, *Simple Complex*, the notion of two or more objects between which there is some relation, as, "A pen in the hand."

ARGUMENT, an act of reasoning expressed in language; popularly speaking, the means by which some point is proved.

CANONS *of Syllogisms*, No. 36.

CATEGOREMATIC *Word*, or CATEGOREM, from κατηγορέω, I predicate, a word that may be employed by itself as a term. Such words are also called *Simple terms.*

CATEGORIES *of Aristotle*, or *Ten Predicaments.* General heads, to one or more of which every term may be referred, viz. οὐσία, πόσον, ποῖον, πρόστι, ποιεῖν, πάσχειν, ποῦ, πότε, κεῖσθαι, ἔχειν. Substance, quantity, quality, relation, action, passion, (or suffering,) place, time, situation, possession, (or covering.)

CAUSE, *Divisions of*, 1st. *Efficient, (à quâ,)* either *Principal*, as the *shoemaker*, *by whom* the shoe is made; or *Instrumental*, as the *awl*, *knife*, &c. *with which* the shoe is made. 2nd. *Material, (ex quâ,)* either *Proximate*, as the *leather of which* the shoe is made; or *Remote*, as the *skin of which* the leather is made. 3rd, *Formal, (per quam,)* either *Proximate*, as the *shape* or *fashion* of the *shoe;* (because the material so shaped becomes a shoe;) or *Remote*, as the *natural form* of the *leather* (viz. that which is essential to its being leather) is the more remote form of the shoe. 4th. *Final; (propter quam;)* denoting the *end for which* a thing is made or done; either *Proximate*, as the proximate end for which a shoe is made, is the *protection of the foot;* or *Remote*, as its more remote end is the comfort and health of the body.

COMMON *Term*, See TERM.
COMPATIBLE *Terms*, see TERM.
COMPLEX *Term*, the same as PROPOSITION.
CONCLUSION *of a Syllogism*, No 37, Rule 2nd.
CONCRETE *Noun*, See TERM.
CONDITIONAL *Propositions*, Rules for drawing a conclusion from, No. 67.
CONDITIONAL *Syllogisms*, No. 65, *et seq.*
CONSTRUCTIVE *Conditional Syllogisms*, No. 67.
CONTINGENT *Matter*, Nos. 18 and 19.
CONTRADICTION, *in Logic*, when any proposition is opposed by another, differing from it both in quantity and quality, No. 22.
CONTRADICTORY *Opposition of Terms*, See TERM.
CONTRADICTORY Propositions, Nos. 22, 23, and 27.
CONTRARY *Propositions*, Nos. 22, 27.
CONTRARY *Terms*, see TERMS.
CONVERSE, Nos. 29, 31, 32.
CONVERSION *of Propositions*, No. 29.
CONVERSION *Simple*, No. 30.
CONVERSION *per Accidens*, or *by Limitation*, No. 30.
CONVERSION *by Negation*, or *Contraposition*, No. 30.
COPULA, No. 6.
DECOMPLEX, or *doubly complex*, *Word* or *Term*. The same as SYLLOGISM, No. 2.
DEFINITION, such an explanation of a term, as separates it, like a boundary, from every thing else. Definition is divided into, 1st. *Nominal*, which explains only the meaning of the *Term*, by an equivalent expression that may happen to be better known, as "Decalogue," "ten commandments;" or 2nd. *Real*, which explains the nature of the *Thing*. These divisions are again divided into *Essential* and *Acci-*

dental; and essential definition is further divided into *physical* and *logical*, (or *metaphysical*.)

DEFINITION, *Essential*, one which assigns the constituent parts of the essence or nature; either the *real* parts of the essence, which are *actually separable*, as if, in defining "Plant," you should enumerate the leaves, stalks, roots, &c. which is a *physical* definition; or the *ideal* parts, which are *separable only in the mind*, as when a plant is defined to be "an organized being, destitute of sensation," which is a *logical* or *metaphysical* definition. N. B. A *logical* definition must always consist of the *genus* and *differentia*.

DEFINITION, *Accidental*, commonly called a *Description;* that definition of a thing which is given by assigning to it the circumstances *belonging* to its essence; viz. Properties and Accidents; (causes, effects, &c.) E. G. "Barometer," "A machine for measuring the weight of the atmosphere." "Balloon," "A silken ball, filled with gas, which causes it to rise into the air." "Lion," "The fiercest and most noble of quadrupeds," &c.

DEFINITION, *three principal Rules for*. 1st. A definition must be adequate, *i.e.* neither too narrow nor too extensive. If it be too narrow, you explain *a part* instead of *a whole;* if too extensive, *a whole* instead of *a part*. 2nd. It must be of itself clearer (*i.e.* consist of ideas less complex) than the thing defined. 3rd. It must be couched in just a sufficient number of proper words. *Proper* is here used in opposition to *metaphorical*, which class of words is excluded on account of their vague and *indefinite* nature.

DESCRIPTION, see DEFINITION ACCIDENTAL.

DESTRUCTIVE *Conditional Syllogisms*, No. 67.

DICTUM *of Aristotle*, *De omni et nullo*, No. 35.

DIFFERENCE, *Differentia*, a Predicable expressing the distinguishing part of the essence of a species, "Rational" is the *Difference* of "Man." It is predicated in *Qualequid*, see SPECIES.

DIFFERENCE, *Generic*, the difference of a subaltern genus, and which may be predicated of all the subordinate species comprehended in that genus. "Having sensation" is the generic difference of "Animal."

DIFFERENCE, *Specific*, the difference of an *infima Species*, and which may be predicated of all the individuals contained under it. "Rationality" is the specific difference of "Man."

DILEMMA, Nos. 72, 73.

DILEMMA, *Simple Constructive*, No. 74.

DILEMMA, *Complex Constructive*, No. 75.

DILEMMA, *Destructive*, No. 76, and *note*.

DISCOURSE, the same as REASONING.

DISJUNCTIVE *Syllogisms*, Nos. 69, 70, 71.

DISTRIBUTED, *Meaning of*, No. 16.

DISTRIBUTION, *Rules concerning*, No. 20.

DIVISION, *in Logic*, is a metaphorical expression, and means the distinct enumeration of several things signified by one common name. You reverse the process of generalization, and add on, instead of drawing off, the differences by which things are distinguished. Thus, "Tree" is logically divided into "Oak," "Elm," "Poplar." There is this difference between logical and physical division. (See INDI-

VIDUAL.) In the former, you may predicate the divided whole of every dividing member. Thus, "Weapon" may be predicated of "Sword," "Pike," "Gun." This cannot happen in the case of physical division. "Gun" cannot be predicated of "the Lock," "the Stock," or "the Barrel."

DIVISION, *Rules for logical*, are *three*. 1st, Each of the parts, or any, short of all, must contain less (*i. e.* have a narrower signification) than the thing divided. "Weapon" could not be a division of the term "Sword." 2nd. All the parts together must be exactly equal to the thing divided. In dividing the term "Weapon," into "Sword," "Pike," "Gun," &c. we must not omit any thing of which "Weapon," can be predicated, nor introduce any thing of which it cannot. 3rd. The parts or members must be *opposed; i. e.* must not be contained in one another. "Book" must not be divided into "Quarto," "French," for a French book may be a quarto, and a quarto, French. N.B. You must always keep in mind the *Principle of Division*, with which you set out; E.G. whether you begin to divide books according to their *size*, *language*, *matter*, &c.

ENTHYMEME, Nos. 80, 81.

EPICHIREMA, No. 89.

EQUIVALENTS, No. 90.

ESSENCE, the nature of any being, whether actually existing or not; "Snow" has an *essence* in summer; in winter, it has existence also.

EXPOSITA, *what*, No. 30.

EXTREMES, No. 7, and *note*, and No. 37, *note*.

FALLACY, an argument, or apparent argument, profess-

ing to decide the matter at issue, while it really does not.

Fallacia Æquivocationis, arising from the use of an equivocal word; E. G. "The dog is an animal; Sirius is the dog; therefore Sirius is an animal." See No. 37, Rule 3rd.

Fallacia Amphiboliæ, or *doubtful Construction;* E. G. "Quod tangitur à Socrate illud sentit; columna tangitur à Socrate; ergo columna sentit." In the major proposition, "sentit" means "he, *i. e.* Socrates, feels." In the conclusion, the same word means "feels Socrates." See No. 37, Rule 1st.

Fallacia Compositionis, when what is proposed in a *divided* sense is afterwards taken *collectively;* E. G. "Two and three are even and odd; five is two and three; therefore five is even and odd." See No. 37, Rule 3rd.

Fallacia Divisionis, when what is proposed in a *collective*, is afterwards taken in a *divided* sense; E. G. "The planets are seven; Mercury and Venus are planets; therefore Mercury and Venus are seven." See No. 37, Rule 3rd.

Fallacia Figuræ Dictionis, when, from any similitude between two words, what is granted of one is, by a forced application, predicated of another; as, "Projectors are not fit to be trusted, therefore he who has formed a project is not fit to be trusted" —*See Dr. Whately's Logic, ch.* iii. § 8.

Fallacia Accidentis, when what is accidental is confounded with what is essential; E. G. "What you bought you have eaten; raw meat is what you bought; therefore raw meat is what you have

eaten." In the major proposition, "What you bought" means *as regards its Essence;* in the minor, *as regards its Accidents.* See No. 37, Rule 3rd.

FALLACIA A DICTO SECUNDUM QUID AD DICTUM SIMPLICITER, when a Term is at one time used in a limited, at another, in an unlimited sense, as, "The Ethiopian is *white as to his teeth;* therefore he is *white.*" See No. 37, Rule 1st.

FALLACIA IGNORATIONIS ELENCHI, an argument that indicates ignorance of the point in dispute; an irrelevant conclusion; as if any one, to shew the inutility of the art of Logic, should prove that men unacquainted with it have reasoned well.

FALLACIA A NON CAUSA PRO CAUSA, which is divided into *Fallacia à non verâ pro verâ*, and *Fallacia à non tali pro tali.* E.G. "A comet has appeared, therefore there will be war."—"What intoxicates should be prohibited, and wine intoxicates." The abuse of it does. In replying, you should deny the false cause, or assign the true one.

FALLACIA CONSEQUENTIS, when that is inferred which does not logically follow; as, "He is an animal; therefore he is a man."

FALLACIA PETITIONIS PRINCIPII, (*begging the Question,*) when that is assumed for granted, which ought to have been proved; as when a thing is proved *by itself*, (called *Petitio statim,*) "He is a man, therefore he is a man;" or *by a Synonym*, as, "A sabre is sharp, therefore a cymetar is;" or *by any thing equally unknown*, as, "Paradise was in Armenia, therefore Gihon is an Asiatic river;" or *by any thing more unknown*, as, "This square is twice the size of this triangle, because equal to this circle;" or *by*

discoursing in a circle, i. e. when the disputant tries to prove reciprocally conclusion from premises, and premises from conclusion; as, "Fire is hot, therefore it burns;" and afterwards, "Fire burns, therefore it is hot."

FALLACIA PLURIUM INTERROGATIONUM, when two or more questions, requiring each a separate answer, are proposed as one; so that if *one* answer be given, it must be inapplicable to *one* of the particulars asked; as, "Was Pisistratus the usurper and scourge of Athens?" The answer "No" would be false of the former particular, and "Yes" would be false of the latter. This fallacy is overthrown by giving to each particular a separate reply.

FALSE, *strictly*, denotes the quality of a proposition which states a thing *not as it is*.

FIGURES, Nos. 41 and 48.

GENERALIZATION, the abstracting or drawing off, in thought, the points of dissimilitude between several objects which resemble each other in some part of their nature, and the assigning to them one *common name* expressive of the particulars in which they all agree. Thus, "Pigeon," "Wren," "Eagle," "Cassowary," differ in *shape*, *plumage*, *size*, &c. but agree in being all *feathered creatures*. They come, therefore, under the general head of "Fowl," or "Bird."

GENERIC DIFFERENCE, See DIFFERENCE.

GENERIC PROPERTY, See PROPERTY.

GENUS, a Predicable, expressing the common or material part of the species of which it is affirmed. "Animal" is the genus of "Man." It is said to be predicated in *Quid*. See SPECIES.

GENUS, *Proximum*, one that is the next remove from a species. "Animal" is the *proximum genus* of "Man." "Living thing" is the *more remote* genus.

GENUS, *Subaltern*, one that is a species, if viewed with reference to a higher or more comprehensive genus; thus "Bird," the *genus* of *nightingale*, is a *species* of *animal*.

GENUS, *Summum*, that which is not a species of any higher genus.

HYPOTHETICAL *Propositions*, See PROPOSITIONS.

HYPOTHETICAL *Syllogisms*, No. 63, 64, 76, 87.

IDEA, the picture or representation of an object in the mind; the result of apprehension.

ILLATIVE, *Meaning of*, No. 31.

ILLICIT PROCESS, No. 37, Rule 4.

IMPOSSIBLE MATTER, Nos. 18 and 19.

INDEFINITE PROPOSITION, See PROPOSITION.

INDIVIDUAL, that which is incapable of *logical* division, (see DIVISION,) and can be only *physically* divided into its *parts*. E.G. "Man," being a species, can be *logically* divided into *individuals*, as "Homer," "Virgil," "Milton;" but these, being individuals, can be divided only *physically*, viz. into their component parts.

INDUCTION, No. 88.

INFER, to draw a conclusion from granted premises.

INFIMA SPECIES, See SPECIES.

INFINITANT PARTICLE, "Not."

JUDGMENT, a decision on the agreement or disagreement of two objects. It is either affirmative or negative. See OPERATIONS.

Logic, the *science* which analyzes the process of the mind in reasoning; the *art* which lays down rules to secure the mind from erroneous inferences. (From λόγος, reason.)

Major Premiss, No. 37, Rule 2; No. 64.

Major Term, No. 37, Rule 1.

Matter *of a Proposition, what*, No. 19.

Middle Term, No. 37, Rule 1. No. 1, *Note.*

Minor Premiss, No. 37, Rule 2. No. 64.

Minor Term, No. 37, Rule 1.

Modal Syllogisms, Nos. 60, 61, 62.

Moods, No. 40, No. 48.

Necessary Matter, Nos. 18 and 19.

Negative Term, See Term.

Operations *of the mind*, concerned in argument are three; viz. Simple Apprehension, Judgment, Discourse, (or Reasoning.)

Opposite Term, see Term.

Opposition *of Propositions*, Nos. 21, 22, 27.

Opposition *of Terms*, See Terms.

Pars deterior, *what*, No. 38, Note.

Positive Term, See Term.

Predicable, See Term Common. Every Predicable expresses either the *whole* essence of its subject, viz. the species; or *part* of its essence, viz. the genus or the difference; or something *joined* to its essence, viz. a property or an accident.

Predicate, No. 6.

Premiss, a proposition employed to establish some conclusion, No. 4.

Privative Term, See Term.

Problem, the same as Question.

PROPERTY, a Predicable expressing something necessarily joined to the essence of the whole species; whatever may be considered as the accompaniment or result of the *differentia*. "Risibility" is the property of "Man." Property is predicated in *Quale*. See SPECIES.

PROPERTY, *threefold division of*.—1st, Universal and peculiar; as, the *faculty of laughter* or *of speech*, to *man*. 2nd, Universal, but not peculiar; as, *the being a biped*, to *man*. *Every man* is a *biped*, but fowls are bipeds too. 3rd, Peculiar, but not universal, as, *the being a philosopher*, to *man*. Man *alone* can be a philosopher, but *every* man *is not* one. This third division, however, is more truly an *accident*.

PROPERTY, *Generic*, the property of a subaltern genus, and which may be predicated of all the subordinate species comprehended in that genus. "Voluntary motion" is the generic property of "Animal."

PROPERTY, *Specific*, the property of an *infima species*, and which may be predicated of all the individuals contained under it. "Risibility" is the specific property of "Man."

PROPOSITIO DE INESSE, *what*, No. 11, *Note*.

PROPOSITION, an act of judgment expressed in language, See No. 6.

PROPOSITION, *Affirmative*, Nos. 11 and 14.

PROPOSITION, *Categorical*, (*pure* and *modal*,) Nos. 11 and 12.

PROPOSITION, *Hypothetical*, (*conditional* and *disjunctive*,) Nos. 11 and 13.

PROPOSITION, *Indefinite*, No. 11, *Note*. No. 19.

PROPOSITION, *Negative*, Nos. 11 and 14.
PROPOSITION, *Particular*, Nos. 11 and 15.
PROPOSITION, *Singular*, No. 11, *Note.*
PROPOSITION, *Contrary*, Nos. 22 and 27.
PROPOSITION, *Subcontrary*, Nos. 22 and 27.
PROPOSITION, *Contradictory*, Nos. 22, 23, and 27.
PROPOSITION, *Subaltern*, Nos. 22 and 27.

SYMBOLS of *Quantity* and *Quality*, No. 17, No. 45.

SYNCATEGOREMATIC WORD, or SYNCATEGOREM, (*συγκατηγορέω*, I predicate together with,) a word that can form only part of a term. Such are the particles of a language, and substantives in an oblique case. Adjectives and participles are generally accounted *Syncategorems*.

TERM, an act of apprehension expressed in language. Also, the subject or predicate of a Proposition, No. 7.

TERM, *Absolute*, one that is considered by itself, and conveys no idea of relation to any thing of which it is a part, or to any other part distinguished from it.

TERM, *Abstract*, denotes the quality of a being, without regard to the subject in which it is; as, "Justice," "Height," "Wisdom." Abstract terms are nouns substantive.

TERM, *Common*, such as stands for several individuals, which are called its *Significates;* as "Man," "City." Such terms, and such only, can be affirmatively predicated of several others, and they are therefore called *Predicables.*

TERMS, *Compatible* or *Consistent*, express two views which *can* be taken of the same object, at the same time, as, "White and Hard."

TERM, *Complex*. The same as PROPOSITION.

TERM, *Concrete*, denotes the quality of a being, and either expresses, or must be referred to, some subject in which it is; as, "Fool," "Foolish," "High," "Wise." Concrete Terms are usually, but not always, nouns adjective.

TERMS, *Contradictory Opposition of*, when they differ only in respectively wanting and having the particle "not," or its equivalent. *One or other* of such terms is applicable to *every* object.

TERMS, *Contrary*, come both under some one class, but are the *most different* of all that belong to that class; as, "Wise" and "Foolish," both coming under the class of mental qualities. There are some objects to which neither of such terms is applicable; a Stone, for instance, is neither wise nor foolish.

TERM, *Definite*, *(finitum,)* one which marks out an object or class of beings; as, "Cæsar," "Corporeal." *Positive* Terms are called *definite.*

TERM, *Indefinite*, *(infinitum,)* one which does not *mark out*, but only *exclude* an object, as, "Not-Cæsar," "Incorporeal." *Privative* and *negative* Terms are called *indefinite*.

TERM, *Negative*, denotes that the positive view *could not* be taken of the object; it affirms the absence of a thing from some subject in which it *could not* be present; as, "A dumb statue;" (you could not say, "A speaking one.") "A lifeless corpse;" (you could not say, "A living one.") N. B. The same term may be negative, positive, or privative, as it is viewed with relation to contrary ideas. Thus "Immortal" is privative or negative, viewed with relation to *Death*, and positive, viewed with relation to *Life*.

TERMS, *Opposite*, express two views which cannot be taken of one single object at the same time; as, "White and Black."

TERM, *Positive*, denotes a certain view of an object, as being actually taken of it; as, "Speech," "A man speaking."

TERM, *Privative*, denotes that the positive view *might* conceivably be taken of the object, but *is not;* "Dumbness," "A man silent;" (you might say, "A man speaking.") "An unburied corpse;" (you might say, 'A buried one.")

TERM, *Relative*, that which expresses an object viewed in relation to the whole, or to another part of a more complex object of thought, as "Half" and "Whole," "Master" and "Servant." Such nouns are called *Correlative* to each other; nor can one of them be mentioned, without a notion of the other being raised in the mind.

TERM, *Simple*. The same as CATEGOREMATIC WORD.

TERM, *Singular*, such as stands for one individual, as "Socrates," "London," "This man," "That city." Such terms cannot be predicated affirmatively of any thing but themselves.

UNDISTRIBUTED MIDDLE, No. 37, Rule 3.

UNIVERSALITY *of a Proposition*. A Proposition is *metaphysically* or *mathematically* universal, when the predicate belongs, without any exception, to every particular contained under the universal subject; as, "All circles have a centre and circumference." It is *physically* universal, when it always agrees, unless in the case of some unnatural exceptions; as, "All men are rational." It is *morally* universal, when it agrees in most instances, but not necessarily, or in the course of nature; as, "All the Cretans are liars."

WORDS, any combination of, making one complex apprehension, is, in logic, a *simple word*; as, "⌈The-hope-of-reward⌉ ⌈is⌉ ⌈the-solace-of-labour.⌉" Every Proposition consists of three simple Words, viz. subject, copula, and predicate.

WORDS, *Various divisions of the manner of employing*; whence a word is called *Univocal*, *Equivocal*, *Analogous*, *of the first Intention*, *or of the second Intention*.

WORDS, *Univocal*, such as are confined to one meaning, and signify but one sort of idea; E.G. "Book," "Lance," "Tomb."

WORDS, *Equivocal*, such as signify two or more ideas; E. G. "Light," "Moor," "Pen," "Post."

WORDS, *Analogous*, such as signify two or more things that have no resemblance *in themselves*, but stand in a similar relation each to its respective object; E.G. "Hand," "Foot," "Sweet." As the *human hand points to* any object to which we would direct the attention, so does the *hand of a clock point to* the hour. As the *foot of an animal* is *the lowest part of it*, so is the *foot of a mountain* with relation to the mountain, &c.

WORDS, *of the first Intention*, such as are used in their vague and common acceptation; thus "Needle" signifies, in popular language, the *little steel instrument used in sewing.*

WORDS, *of the second Intention*, those to which a more precise and limited meaning is given, proper to some particular art, science, or system; thus "Needle" means, in the language of navigation, the *little steel bar in the mariner's compass.*

APPENDIX.

ON ACADEMICAL DISPUTATION.

THE Respondent, in a Disputation, being always supposed to maintain a true proposition, the argument of the Opponent, whose province it is to support the contradictory, must be presumed to be founded on some fallacy.

If the respondent, upon trying his opponent's objection in the form of a categorical syllogism, should find that it offends against any one of the six rules in No. 37, by pointing out such a violation, he overthrows the opponent's argument.

Should the objection be hypothetical, the respondent must examine the connexion between antecedent and consequent, (No.66,) and whether the

two rules at No. 67 have been observed. The detection also of any violation of the rules for drawing a conclusion from disjunctive propositions (Nos. 70, 71,) will destroy a fallacy so supported.

Fallacies that consist in a violation of the express rules of logic are more palpable than those which depend on the ambiguity of the middle term; by an ingenious application of which to the terms of the question, (No. 37, Rule 1,) fallacies are very generally introduced.

Most frequently, therefore, the first business of the respondent is to examine the middle term of his opponent's argument; and ascertain whether, in his comparison of it with the terms of his conclusion, he has used it in exactly the same sense in both instances. The first and second intention of words, their being employed sometimes in a literal, and sometimes in a metaphorical, sense, with other considerations arising from the various meanings attached to the same, or similar, terms, afford a wide scope for the exercise of fallacy, and call for acuteness, both natural and acquired, to detect it, if skilfully concealed.

The opponent has the choice of many points of

attack; for if he prove that the proposition advanced by the respondent appears at all inconsistent with any part of the system he is defending, or at variance with any received principle of truth, &c. or expressed in terms of too extensive a latitude,—by driving the respondent to explain such a difficulty, he has fairly executed his task.

The Cambridge argument now practised by the opponent at a public disputation in the schools, generally consists of three constructive conditional syllogisms (No. 67.) The consequent (No. 65) in the first syllogism, is always, "Cadit quæstio." If the respondent should deny the consequence, (or conclusion,) then the consequent of the second syllogism will be, "Valet consequentia;" on the contrary, if he should deny the minor, (No. 64,) the consequent of the second syllogism will be, "Valet minor." If the respondent should deny the consequence of the second syllogism, the consequent of the third will be, "Valent consequentia et argumentum;" if he should deny the minor of the second, the consequent of the third will be, "Valent minor et argumentum."

Whichever proposition the respondent has de-

nied, (whether it be the minor or consequence,) the opponent, in his next syllogism, affirms to be valid; taking for the consequent of his major proposition, "Valet minor," or "Valet consequentia," as the case may be.

Should the argument consist of only two syllogisms, the former will have for its consequent "Cadit quæstio," and the latter, either "Valent consequentia et argumentum," or "Valent minor et argumentum," according to the previous denial of the respondent. Should it consist of more than three, all, except the last, will have their consequent in the same manner as the second; either "Valet consequentia," or "Valet minor." The consequent of the concluding syllogism is always, "Valent consequentia et argumentum," or, "Valent minor et argumentum." It is not, however, advisable to use more than three syllogisms in constructing an argument for a disputation.

It is the duty of the respondent, at the close of each syllogism, either to concede or deny the minor proposition, as circumstances may require. If it be evidently true, he must, of course, concede it, but deny the consequence; viz. that its truth inva-

lidates the question he is maintaining; "Concedo minorem, et nego consequentiam." If the minor be false, or doubtful, he denies it, ("Nego minorem,") and the opponent, on the other hand, must endeavour to establish it by some unquestionable medium of proof.

The following examples, exhibiting arguments of three, four, and two syllogisms, and shewing the mode of proceeding, as the minor or consequence may be denied in different places, will facilitate the application of the above remarks. The *Form* of the argument being at present the point for consideration, unmeaning symbols have been substituted for terms.

An Argument of three syllogisms, with the minor of the first denied.

OPPONENS.

MAJOR PROPOS.

Antecedent. *Consequent.*

1. Si | A sit B, | | cadit quæstio; |

MINOR PROPOS.

Sed A est B;

CONSEQUENTIA.

Ergo cadit quæstio.

RESPONDENS.

Nego minorem.

2. Si C sit D, valet minor;
Sed C est D;
Ergo valet minor.

RESPONDENS.

Concedo minorem, et nego consequentiam.

Pergit OPPONENS *ad syllogismum tertium.*

3. Si E sit F, valent consequentia et argumentum;
Sed E est F;
Ergo valent consequentia et argumentum.

An Argument of three syllogisms, with the minor of the second denied.

OPPONENS.

1. Si A sit B, cadit quæstio;
Sed A est B;
Ergo cadit quæstio.

RESPONDENS.

Concedo minorem, et nego consequentiam.

OPPONENS *pergit ad syllogismum secundum.*

2. Si C sit D, valet consequentia;
Sed C est D;
Ergo valet consequentia.

RESPONDENS.

Nego minorem.

OPPONENS *pergit ad syllogismum tertium.*

3. Si E sit F, valent minor et argumentum;
Sed E est F;
Ergo valent minor et argumentum.

An Argument of four syllogisms, with the minor of the second denied.

OPPONENS.

1. Si A sit B, cadit quæstio;
Sed A est B;
Ergo cadit quæstio.

RESPONDENS.

Concedo minorem, et nego consequentiam.

Pergit OPPONENS.

2. Si C sit D, valet consequentia;
Sed C est D;
Ergo valet consequentia.

RESPONDENS.

Nego minorem.

Pergit OPPONENS.

3. Si E sit F, valet minor;
Sed E est F;
Ergo valet minor.

RESPONDENS.

Concedo minorem, et nego consequentiam.

Pergit OPPONENS.

4. Si G sit H, valent consequentia et argumentum;
Sed G est H;
Ergo valent consequentia et argumentum.

N. B. If the minor of the third syllogism had been denied, the consequent and conclusion of this last syllogism would have been, "Valent minor et argumentum."

An Argument of two syllogisms, with the minor of the first denied.

OPPONENS.

1. Si A sit B, cadit quæstio;
   Sed A est B;
   Ergo cadit quæstio.

RESPONDENS.

Nego minorem.

Pergit OPPONENS.

2. Si C sit D, valent minor et argumentum;
   Sed C est D;
   Ergo valent minor et argumentum.

Should the minor of a concluding syllogism be false, the respondent does not say, "Nego minorem," but proceeds at once to his reply.

The antecedent, as may be seen in the preceding examples, is first enunciated in the subjunctive, or, at least, conditionally; then affirmed, in the minor premiss, in the indicative mood, and the consequent accordingly established.

It may happen, that the three conditional syllogisms admit of being reduced to the form of a single

categorical syllogism; to the major, minor, and conclusion of which they severally correspond. But even in instances of this kind, it is not necessary that the three conditional syllogisms should be placed in the same order as the three propositions of the categorical syllogism, if the opponent thinks that, by a different arrangement, his sophism will be the better concealed.

The three conditional syllogisms of an opponent's argument, when they do not correspond with the three propositions of a categorical syllogism, would require, in order to be stated in form, to be expanded into two or more categorical syllogisms.

In responding to an opponent, it is by no means necessary to unfold in one's mind the objections he has adduced into as many strict categorical syllogisms as will lead to his conclusion; for this would often be a trifling and tedious process to the respondent; though it is highly desirable to possess the skill that would enable him, if required, to go through it.

Should the respondent, from the subtlety of his opponent's sophism, or any other cause, experience great difficulty in discovering the pith of the objection, the Moderator usually assists him, by re-

stating the opponent's argument in a more lucid and intelligible form; and sometimes directing his attention to the quarter in which the fallacy is hidden.

It has been already stated to be the opponent's province, should the respondent deny the minor of his syllogism, to confirm it by some medium of proof. This, in the Divinity School, is generally done by an appeal to texts of Scripture; which, it may be observed, are commonly cited without being called for by the respondent, as they often afford ground for critical animadversion on the part of the professor, and opportunity for a further trial of the skill and knowledge of the disputants.

It is usual for the professor to call on the respondent for an interpretation into Latin of the more abstruse and difficult texts of the New Testament, that may happen to be quoted by the opponent. For citations from the Old Testament, the Vulgate is employed.*

When the respondent has replied to the opponent's objection, the moderator occasionally demands

---

* A copy of the Greek New Testament, and of the Vulgate version of the Old, are placed on the desk of the respondent's rostrum.

of the latter his own solution of the sophism he has constructed.

The following is the form of a divinity Act, with a specimen of the style of argumentation, as practised in the University of Cambridge. The compiler, in conformity with the principles laid down in the preceding part of this manual, has, at the bottom of the page, unfolded each argument in a categorical form.

The preliminaries of a divinity act, the formula of the prayers, the habit of the respondent, &c. are detailed in the "Ceremonies of the University of Cambridge," edited by H. Gunning, Esq.

Every one about to keep a divinity act first submits to the Regius Professor three or four questions, which should be on some important doctrine of the Christian religion, or leading article of the Protestant faith. The professor having selected one of these questions, the respondent (that is to be) makes it the subject of a Latin thesis: the delivery of which ought not to occupy more than half-an-hour.*

* The Church Articles supply suitable subjects for disputation. A good list of questions that have been already discussed is to be found in the Preface to Bishop Watson's Theological Tracts.

About ten days before the act is kept, the respondent should wait on the professor, in order to obtain of him the second question. This is always chosen exclusively by the professor himself, who, when the disputation is ended, delivers a thesis (called a *Determination)* upon it. It is the province of the respondent to answer the arguments brought against both questions.*

---

* It is greatly to be regretted, that many clergymen, after entering on the public duties of their office, should often neglect to cultivate the advantages conferred on them by a University education. Not that it is desirable, or even defensible, that a minister of the Gospel should employ much of his time either in classical or philosophical researches; but some familiarity with *theological* Greek and Latin might fairly be expected of every divine, however arduous the duties of his parish may be. It is incredible how much time may be snatched for improvement out of the busiest and most laborious life. Erasmus wrote his "Praise of Folly," while travelling on horseback into Italy; "ne totum illud tempus quo equo fuit insidendum, illiteratis fabulis tereretur."

No one who has discontinued for many years a moderate cultivation of Greek and Latin, can proceed to the higher degrees at the University, without disagreeable anticipations of embarrassment and disgrace, in the attempt to hold a public disputation.

The writings of Limborch may be very useful to any one preparing for a divinity act.

On the professor having ascended his rostrum, he directs the respondent to begin: "Agas, Domine." The respondent then says, "Oremus," and pronounces the prayer "Actiones nostras," &c. He afterwards proposes the questions thus:

"*Quæstiones sunt: (exempli gratiâ:)*

1. '*Oblatio Christi semel facta perfecta redemptio est.*'

2. '*Fides justificans non potest à bonis operibus disjungi.*'"

As the question on which the respondent has composed his thesis is always proposed first, he then says, "De priori," and proceeds to deliver his thesis.

When the thesis is concluded, the first opponent is directed by the professor to ascend the rostrum: "Ascendat opponentium primus."

The opponent then reads the two questions, as the respondent had done before, and proceeds to his arguments.

To give as clear an idea as possible of the manner of opposing and responding, the discussion of the first argument is here exhibited in the form of dialogue.

OPPONENS.

Contra priorem.

1. Si Divus Paulus Christum appellet, "Agnum nostrum paschalem," cadit quæstio;

Sed Divus Paulus Christum appellat, "Agnum nostrum paschalem;"

Ergo cadit quæstio.

Provoco ad priorem Pauli Epist. ad Corinth. cap. 5to. com. 7mo.

RESPONDENS.

Concedo minorem, et nego consequentiam.

OPPONENS.

2. Si agnus paschalis non esset sacrificium piaculare, valet consequentia;

Sed agnus paschalis non erat sacrificium piaculare;

Ergo valet consequentia.

RESPONDENS.

Nego minorem.

OPPONENS.

Provoco ad Exodi cap. 12$^{mum.}$ comm. 13$^{tio.}$ et 14$^{to.}$ unde apparet sacrificium paschale primitùs institutum fuisse in id tantùm, ut, sanguine foribus asperso, angelus vindex domos Israëlitarum agnosceret, et illæsas præteriret; et in sæculis subsecutis observatum fuisse in id tantùm, ut majorum suorum ex Ægypto liberationem Judæi commemorarent.

Si dominus respondens nunc concedat minorem, necesse est consequentiam neget: et opponens pergit ad syllogismum tertium.

3. Si igitur neque mors Christi sit sacrificium piaculare, valent consequentia et argumentum;

Sed igitur mors Christi non est sacrificium piaculare;

Ergo valent consequentia et argumentum.

RESPONDENS.

Constat tum agni paschalis mactationem, tum Christi mortem, fuisse reverà sacrificia. Hoc unum comparatio ab Apostolo instituta requirit. Esto, agni paschalis mactationem nihil piaculare habuisse; Christi tamen mors, quippe quæ sacrificium sit, hactenùs agni paschalis mactationi respondet; licet vim majorem habeat, quia sacrificium est *piaculare*.

Si verò dominus respondens non concedat minorem in syllogismo secundo, tunc moderatoris erit judicium suum interponere. Si ille existimet minorem valere, opponentem jubebit ad syllogismum tertium pergere. Contra ea, si pronuntiet minorem non valere, tunc domino opponenti nihil restat, nisi ut det manus, et ad argumentum aliud novum pergat.

In hoc argumento dubitari potest, agni Paschalis mactatio sacrificium piaculare fuerit, necne. Certè sanguis foribus aspersus vim mali avertendi habuit, ideòque effectum quendam piacularem. Sed agni mactatio, in sæculis posterioribus quotannis repe-

tita, nullam aliam vim habere videtur nisi commemorativam.*

When the respondent has replied to the first objection, the professor either signifies his approbation of the answer, or suggests another more appropriate and satisfactory. He then directs the opponent to proceed to his next argument; "Probes aliter."

Second Argument.

OPPONENS.

1. Si doctrina de redemptione humanâ hoc fundamento nitatur, scilicet, necesse fuisse ut Divinæ justitiæ pro hominum peccatis satisfieret, cadit quæstio.

---

* The conditional syllogisms of which this objection consists, correspond with the three propositions of a regular categorical syllogism, and it may be viewed as *Celarent* with the premises transposed; "Christ was the paschal lamb; the paschal lamb was not a piacular sacrifice; therefore Christ was not a piacular sacrifice."

Ce- The paschal lamb was not a piacular sacrifice;
-la- Christ was the paschal lamb; therefore
-rent. Christ was not a piacular sacrifice.

In the major proposition, the middle term (the paschal lamb) is used in its primary and literal sense; in the minor proposition, in its secondary and metaphorical sense. It is not, therefore, fairly compared with the terms of the conclusion or question. This is, "Fallacia æquivocationis." After all, the truth of the major proposition admits of doubt.

Sed doctrina de redemptione humanâ hoc fundamento nititur;

Ergo cadit quæstio.

2. Si, ut hoc efficeretur, pœnæ peccatis humanis debitæ in Christum translatæ fuerint,—unum inter omnes à peccati labe purum, valet consequentia.

Sed, ut hoc efficeretur, &c.

Ergo valet consequentia.

Provoco ad Esaiæ cap. 53tium. com. 6to. et ad priorem Petri Epistolam, cap. 2do. com. 24to.

3. Si verò justitiæ proprium sit, pœnas non nisi de nocentibus exigere, valent consequentia et argumentum.

Sed justitiæ proprium est, &c.

Ergo valent consequentia et argumentum.*

---

* The punishment of the innocent for the guilty, says the opponent, being repugnant to the principles of justice, could not have satisfied Divine justice for the sins of men. The innocence and vicarious punishment of Christ being supposed to be conceded, the objection, stated in form, will appear thus:

Ce- What is irreconcileable with justice, cannot satisfy Divine justice.

-la- To inflict the punishment of guilt on the innocent, is irreconcileable with justice; therefore

-rent. It could not satisfy Divine justice.

Under the moral government which God exercises here, the innocent very frequently suffer for the guilty. If, then, we allow the moral government and attributes of God, vicarious punishment and the Divine justice will no longer be

Responsum.

E Sacris Scripturis hoc unum colligendum est de redemptione humanâ; scilicet Christi mortem hunc effectum habuisse, ut homines à peccati pœnâ liberaret. Quod rationi satis consentaneum est. Videmus enim rerum naturam à Divino Opifice et Rectore ita constitutam, ut plurima nobis contingant beneficia áliorum ope, qui sæpe incommoda volentes subeunt, in id tantùm ut nos adjuvent. Nihil igitur objici potest contra doctrinam de redemptione humanâ in Sacris Scripturis traditam, quod non pari jure contra quotidianum rerum humanarum et Divinæ providentiæ ordinem adhibeatur.

Third Argument.

1. Si Divus Paulus doceat cœnam Dominicam idem esse Christianis quod epulæ sacrificales tum Judæis tum Ethnicis, cadit quæstio.

Sed Divus Paulus docet, &c.

Ergo cadit quæstio.

Provoco ad 1 Cor. x. 16—21.

2. Si igitur cœna Domini sit epulum ex oblatis, valet consequentia.

Sed cœna Domini est, &c.

Ergo valet consequentia.

---

considered incompatible. The minor premiss of the categorical syllogism will be denied, in this case, to be universally true.

3. Si igitur oblatio Christi sæpiùs repetatur, valent consequentia et argumentum.

Sed oblatio Christi, &c.

Ergo valent consequentia et argumentum.*

---

* This argument may be stated categorically, thus, in three syllogisms.

1.

Bar- What a sacrificial feast was to the Jews and Heathens, is what the Lord's Supper is to Christians;

-ba- A feast upon propitiatory offerings is what a sacrificial feast was to the Jews and Heathens; therefore

-ra. A feast upon propitiatory offerings is what the Lord's Supper is to Christians.

2.

Bar- A Christian propitiatory offering is the oblation of Christ;

-ba- What takes place in the Lord's Supper is a Christian propitiatory offering; therefore

-ra. What takes place in the Lord's Supper, is the oblation of Christ.

3.

Bar- What takes place in the Lord's Supper is frequently repeated;

-ba- The propitiatory oblation of Christ is what takes place in the Lord's Supper; therefore

-ra. It is frequently repeated.

The middle term of the first syllogism is here taken in different senses in the major and minor premiss. In the major premiss, it means what a sacrificial feast was, *with regard to one particular*, (viz. communion with the Deity,)

RESPONSUM.

Non docet Paulus cœnam Dominicam *prorsus* idem esse Christianis quod Judæis atque Ethnicis Epulæ sacrificales. Affirmat quandam esse similitudinem, et hâc tantùm parte, quòd insit utrique sacrificantium communicatio cum numine. Nec comparatio arctiùs premenda est. Apostolus non affirmat Christianos, in Eucharistiâ celebrandâ, et Ethnicos, in Epulis sacrificalibus, in hoc similiter agere, quòd oblatis vescantur; sed quòd et Christiani vero cum Deo, et Ethnici cum idolis suis, religiosam communicationem instituant.

Fourth Argument.

This and the following argument are against the second question, according to the rules for keeping a first opponency.

Contra Secundam.

1. Si fides justificationem antecedat, cadit quæstio.
Sed fides justificationem antecedit;
Ergo cadit quæstio.

2. Si opera qualiacunque ante justificationem peracta rationem peccati habeant, valet consequentia.

---

and thus, in *that* particular, it agrees with the major term; in the minor premiss, it is taken simply, and thus, in *another* particular, (viz. its propitiatory character,) it agrees with the minor term. It is not, therefore, fairly compared with the terms of the conclusion. This may be referred to "Fallacia à dicto secundum quid, ad dictum simpliciter."

Sed opera qualiacunque, &c.
Ergo valet consequentia.

3. Si igitur fides quâ justificationem consequimur, existere possit à bonis operibus disjuncta, valent consequentia et argumentum.
Sed fides quâ, &c.
Ergo valent consequentia et argumentum.*

---

* The opponent contends, that as justifying faith precedes justification, and all works before justification are sinful, therefore justifying faith may exist apart from good works. The formal statement of this argument requires four categorical syllogisms.

1.

Ce- Works that have in them the nature of sin are not good works;
-la- All works done before justification have in them the nature of sin; therefore
-rent. No works done before justification are good works.

2.

Bar- Whatever is preceded by justification is preceded by what precedes justification;
-ba- Good works are preceded by justification; therefore
-ra. They are preceded by what precedes justification.

3.

Bar- What precedes justification precedes good works. *(Equipollent to the conclusion of the last.)*
-ba- Faith precedes justification; therefore
-ra. It precedes good works.

Responsum.

Cogitatione solâ distingui possunt fides et opera bona. Fides fons est, opera bona sunt fluenta; fides causa, opera bona effectus. Simul ac fides existat, justificatio incipit, nullâque morâ interpositâ, subsequuntur opera bona. Ut sol igitur ante radios solares, ita fides ante opera bona; sed fide existente, opera bona proveniant necesse est. Neque magis disjungi possunt à fide, quàm lux à sole.

Fifth Argument.

1. Si operanti merces tribuatur non ex gratiâ sed ex debito, cadit quæstio.

Sed operanti merces, &c.

Ergo cadit quæstio.

Provoco ad Rom. iv. 4.

4.

Bar- Whatever precedes good works is distinct from them;

-ba- Justifying faith precedes good works; therefore

-ra. It is distinct from them.

Faith may be separated from good works only in thought. Faith is the fountain-head; good works, the streams that flow from it. Faith is the cause; good works, the effect. As soon as there is faith, justification begins, and good works immediately follow. As, therefore, the sun must have existed before the sunbeams, so faith must be previous to good works. But if there be faith, good works are of necessity produced; nor can they any more be separated from faith, than light can be parted from the sun.

2. Si verò justificatio, quam per fidem consequimur, sit ex gratiâ, valet consequentia.

Sed justificatio, &c.

Ergo valet consequentia.

Provoco ad Rom. iv. 5.

3. Si igitur opera bona, cum eâ, quâ justificamur, fide nihil commune habeant, valent consequentia et argumentum.

Sed opera bona, &c.

Ergo valent consequentia et argumentum.*

---

* The reward of him who works, says the opponent, is shewn in Scripture to be not of grace, but of debt. But *our* reward, viz. Justification by faith, is proved by Scripture to be of grace; therefore it cannot be the reward of him who works, nor is justifying faith connected with good works. This argument, in order to be formally stated, requires, like the last, four categorical syllogisms.

1.

Ce- That which is of debt is not of grace;
-la- The reward of him who works is of debt; therefore
-rent. It is not of grace.

2.

Ce- What is of grace, is not the reward of him who works.

(Converse of the conclusion of the last syllogism, E.)

-la- Justification by faith is of grace; therefore
-rent. It is not the reward of him who works.

RESPONSUM.

Fatendum est, justificationem nostram Divinâ ex gratiâ solummodò concessam esse; non autem sequi-

---

3.

Ce- What is not the reward of him who works, has no connexion with good works;

Predicate.

-la- Justification by faith is | not-the-reward-of-him-who-works; | therefore

-rent. It has no connexion with good works.

4.

Ce- The instrumental cause of justification has no more connexion with good works, than justification itself has;

la- Justifying faith is the instrumental cause of justification; therefore

-rent. It has no more connexion with good works than justification itself has.

The major proposition of the third syllogism is unduly assumed. That which is not the reward of works may yet have connexion with them *in other respects*. Though justification is a favour, not a reward of works, yet works may be required as a *condition* of justification; and in this respect they may be inseparably connected. This circumstance does not diminish our debt of gratitude to God, to whose grace, as the efficient cause, all spiritual blessings are ascribable.

They who object to call good works, "Conditions of salvation," may term them, the necessary fruits of the faith whereby we obtain salvation; although salvation itself must be accounted a gratuitous benefit of God.

tur, licet bona opera pro causâ justificationis non habenda sint, nihil esse inter fidem et bona opera commune. Fieri enim potest, quod Sacræ Scripturæ reverà doceat, ut opera bona sint *conditiones* salutis, quam tamen Divinæ gratiæ, quasi causæ efficienti, acceptam referre debemus.

Si nolis opera bona *conditiones* salutis appellari, tunc ea licet appelles, fructus necessarios fidei illius quâ salutem consequimur; cùm tamen salus ipsa sit Dei beneficium gratuitum.

The opponent, when his last argument has been answered by the respondent, descends from the rostrum upon the moderator thus dismissing him; "Satis disputâsti."

ACTS IN THE CIVIL LAW.

Before keeping an Act in the Civil Law, the student submits, to the Regius Professor in that faculty, a few questions, that he may fix on one of them as a fit subject for a Latin thesis.*

---

* A candidate for the degree of LL.B. must submit to the Professor the question he means to write upon, at least one term before the act is kept. A candidate for the degree of LL.D. must do the same at least two terms previously to his act.

A second question is also chosen by the professor exclusively, who reads a Determination on it, when the disputation is finished.

On the day of the exercise, the respondent having occupied his rostrum, and the professor being seated, the Father of the respondent's college directs him to begin: "Domine respondens, agas."

The following is a copy of the printed questions proposed by the Professor in his examination paper of the present year. Other questions in MS. are also given to each student, according to the nature of the subjects proposed for discussion in the Schools.

1. Explain the nature and utility of syllogisms in general.
2. Explain the nature of the syllogisms used in the law schools.
3. State an instance of a Dilemma in favour of your first question from
4. Prove your first question to be true by Induction from
5. Form an argument in two hypothetical syllogisms, in favour of your first question, from
6. Form, in Latin, an argument in three hypothetical syllogisms, against your first question, from
7. Form, in Latin, an argument against your second question, in three hypothetical syllogisms, from

Let the minor of the second syllogism be false.

8. Make a short statement, in *English*, of your first question.
9. Make a short statement, in *Latin*, of your second question.

The respondent then proposes the questions, placing that first on which his thesis is written.

Except when an opponency is kept for a Doctor's degree, the Regius Professor is himself both opponent and moderator. He produces as many arguments against each question as he thinks proper, in the form of syllogism already explained.

It is the office of the respondent (as in the Divinity School) to defend each question by an appropriate answer to the objections adduced by the opponent.

If the answer of the respondent be satisfactory to the professor, he signifies his approbation, and proceeds, in the capacity of opponent, to propose his next argument. But if the answer of the respondent be erroneous or inconclusive, the professor (departing for the time from the character of opponent) points out to the respondent the true solution of the difficulty: and this he does, not only for the advantage of the respondent but, for the instruction of the auditors frequenting the law-school, the majority of whom attend there expressly with a view to prepare themselves for responding in a disputation.

In the course of the act, the professor, at his discretion, tries the ability of the respondent, by interrogatories on such subjects as are connected with the question.

The following is a specimen of the nature of the questions discussed, and of the manner of arguing against them. The student may easily collect, from the references,* the nature and force of the argu-

Quæstiones sunt:

1. *Decemviri creditoribus in debitores jus vitæ atque necis non dederunt.*

2. *Romani primos Christianos non ideò persecuti sunt, quia cœtus nocturnos celebrabant.*

Contra priorem.

1. Si in lege Decemvirali de debitore, pœna capitis non nisi de ultimo supplicio est accipienda, cadit quæstio.

Sed in lege Decemvirali, &c.

Ergo cadit quæstio.

2. Si dominis in servos jus erat vitæ atque necis, valet minor.

---

* A copy of the *Corpus Juris Civilis*, is placed on the rostrum of the respondent, and another on that of the opponent.

Sed dominis in servos, &c.
Ergo valet minor.

3. Si æris convicti jure Decemvirali in servitutem redigebantur, valent consequentia et argumentum.
Sed æris convicti, &c.
Ergo valent consequentia et argumentum.

The opponent then refers the respondent to the following authorities in confirmation of his argument, and it is the duty of the respondent to make his answer.

Ins. 1. 8. 1.
D. 1. 5. 5.
Matt. 18. 25.
Liv. Hist. 6. 14.

Contra alteram.

1. Si causa persecutionum quibus primi Christiani vexabantur, aut ab ipsâ Christi religione aut ex quâdam ratione civili petenda est, cadit quæstio.
Sed causa persecutionum, &c.
Ergo cadit quæstio.

2. Si Romani omnibus ferè gentibus suam religionem et suos ritus celebrare permitterent, valet consequentia.
Sed Romani, &c.
Ergo valet consequentia.

3. Si igitur necesse est ut quædam ratio civilis eos excitaret ad Christianos vexandos, valet consequentia.
Sed necesse est ut, &c.
Ergo valet consequentia.

4. Si ista ratio fuit metus ne quid detrimenti caperet respublica, valent consequentia et argumentum.

Sed ista ratio fuit, &c.
Ergo valent consequentia et argumentum.

Tac. Annal. 1, 73.
xii. Tab.
Leg. Gab.
SCT Marc.
D. 47, 22, 1.
D. 47, 11, 2.

In the progress of this argument, the opponent might, if occasion required, refer to the sacred Scripture, as well as to the authorities above mentioned.

The respondent's answer will be suggested partly from his own interpretation of these authorities cited by the opponent, and partly from his own view of the question in general.

ACTS IN MEDICINE.

A medical thesis may be composed on any practical, physiological, or pathological question. It must be of such a length as not to consume more than half-an-hour in the delivery.

For the degree of M. B. the question must be submitted to the professor, for his approval, six weeks before the act is kept; and, for the degree of M. D., three months before.

The respondent has to defend two questions, of which one is appointed exclusively by the professor; as in the case of a Divinity Act.

The professor does not restrict the opponent from extending the number of his arguments, if he pleases; but he must not produce fewer than five in all; *i. e.* three against the first question, and two against the second. Each of these arguments may consist of two, three, or four syllogisms.

There is but one opponent; and if the act be kept for a Doctor's degree, the opponent is most frequently the professor himself.

The forms of keeping an act in Medicine, correspond with those observed in keeping an act in the civil law.

In a medical disputation, it does not always happen that the respondent maintains the position which the moderator holds to be true. The truth may appear on the opponent's side, and the decision be accordingly given in his favour. The following, however, are specimens in which the position maintained is true, and the objections fallacious.

Quæstiones sunt:

1. *Venæsectio primum et præcipuum remedium est Enteritidis.*

2. *Bilis è sanguine venoso secernitur.*

OPPONENS.

Contra priorem.

1. Si intestinorum inflammatio ab alvo diu astrictâ et suppressâ sæpe oriatur, cadit quæstio.

Sed intestinorum &c. sæpe oritur;

Ergo cadit quæstio.

RESPONDENS.

Concedo intestinorum inflammationem cum alvo diu astrictâ sæpiùs conjunctam esse, et aliquando ex hac origine exortam.

OPPONENS.

2. Si alvum solvere et purgare primum et præcipuum sit hujus mali remedium, valet consequentia.

Sed alvum solvere, &c.

Ergo valet consequentia.

RESPONDENS.

Concedo quoque maximi esse momenti ut alvus astricta solvatur.

OPPONENS.

3. Si igitur intestinorum inflammatio ab alvo astrictâ orta, optimè curetur medicamentis purgantibus, valent consequentia et argumentum.

Sed intestinorum inflammatio, &c.

Ergo valent consequentia et argumentum.

RESPONDENS.

In hoc morbo res maximi momenti est ut depellatur inflammatio, id quod optimè per venæsectionem efficitur. Animadvertendum quoque medicamenta purgantia sæpe vim suam non exerere, nisi post detractionem sanguinis.

OPPONENS.

Contra alteram.

1. Si in omni aliâ glandulâ corporis, præterquam hepate, secretio humoris fiat è sanguine arterioso, cadit quæstio.

Sed in omni &c.

Ergo cadit quæstio.

RESPONDENS.

Concedo minorem et nego consequentiam.

OPPONENS.

2. Si in rebus obscuris investigandis confidere necesse sit comparationi similitudinis vel analogiæ, valet consequentia.

Sed in rebus obscuris &c.

Ergo valet consequentia.

RESPONDENS.

Concedo minorem &c.

OPPONENS.

3. Si igitur ab hac comparatione concludendum sit, ut bilis è sanguine arterioso secernatur, valent consequentia et argumentum.

Sed ab hac comparatione &c.

Ergo valent consequentia et argumentum.

RESPONDENS.

Argumento domini opponentis refragatur quidem analogia, quum jecori, quod bilem secernit, sanguis venosus suppeditetur, (ex Venâ Portarum scilicet,) simili modo quo cæteris glandulis sanguis arteriosus, ex arteriis suis.

ACTS IN THE SCHOOL OF ARTS.

The Preliminaries of these Acts are, of necessity, well known to all who are concerned in keeping them. No one can oppose or respond in the School of Arts, till he has resided seven Terms in the University. A particular introduction to the following questions would, therefore, be superfluous.

Quæstiones sunt:

1. *Rectè statuit Newtonus in nonâ suâ sectione libri primi.*

2. *Rectè sese habent Principia Calculi tum Differentialis tum Integralis.*

3. *Rectè statuit Paleius de Virtute.*

Contra primam.

1. Si cùm spiralis reciproca in antecedentia revolvatur eâdem velocitate angulari quâ corpus in consequentia movetur, orbita in fixo spatio descripta fiat

linea recta in quâ corpus motu uniformi ad centrum accedit, cadit quæstio.

Sed cùm &c. **** fit &c. *** accedit;

Ergo cadit quæstio.

2. Si cùm vis in spirali reciprocâ varietur $\frac{1}{D3}$, et virium differentia in orbitâ quiescente et in orbitâ in fixo spatio descriptâ varietur similiter $\frac{1}{D3}$, consequens sit totam vim in orbitâ in fixo spatio descriptâ variari $\frac{1}{D3}$, valet consequentia.

Sed cùm vis, &c. **** consequens est &c.

Ergo valet consequentia.

3. Si verò cùm vis varietur $\frac{1}{D3}$, corpus nequeat in rectâ lineâ ad centrum descendere motu uniformi, valent consequentia et argumentum.

Sed cùm &c. **** nequit &c.

Ergo valent consequentia et argumentum.

RESPONSUM.

Differentia virium centripetarum et centrifugarum in orbitâ in fixo spatio descriptâ, eadem est ac in orbitâ quiescente. Sed in spirali reciprocâ vires centripeta et centrifuga æquales sunt. Ergo in rectâ lineâ quæ in fixo spatio describitur æquales sunt; ideòque corpus nullâ vi impulsum velocitate primâ ad centrum uniformiter accedit.

The first opponent produces two other similar arguments against the first question.

Contra secundam.

1. Si inter limites $x=a$, $x=b$ $\int \frac{dx}{x}$ fiat $h.l.\frac{a}{b}$, cadit quæstio.

Sed inter limites &c.

Ergo cadit quæstio.

2. Si inter eosdem limites $\int x^{n-1}\,dx$ fiat $\frac{a^n-b^n}{n}$ valet consequentia.

Sed inter &c.

Ergo valet consequentia.

3. Si igitur cùm $n=o$, $\int\frac{dx}{x}$ fiat $\frac{a^o-b^o}{o}$, seu $\frac{1-1}{o}$, seu o, valent consequentia et argumentum.

Sed cùm &c.

Ergo valent consequentia et argumentum.

RESPONSUM.

$$a^n=1+h.\,l.\,a.\,n+\frac{\overline{h.\,l.\,a.}\rceil^2}{1\,.\,2}\,n^2+\&c.$$

$$b^n=1+h.\,l.\,b.\,n+\frac{\overline{h.\,l.\,b.}\rceil^2}{1\,.\,2}\,n^2+\&c.$$

$$\therefore a^n-b^n=\left\{h.\,l.\,a-h.\,l.\,b\right\}.\,n+\&c.$$

$$\therefore\frac{a^n-b^n}{h}=\left\{h.l.a-h.l.b\right\}+\frac{\overline{h.\,l.\,a}\rceil^2-\overline{h.\,l.\,b}\rceil^2}{1\,.\,2}n+\&c.$$

$$\therefore\frac{a^o-b^o}{o}=h.\,l.\,a-h.\,l.\,b.$$

$$=h.\,l.\frac{a}{b}$$

Ergo valor fractionis $\frac{a^n-b^n}{n}$ cum $n=o$ non evanescit, sed fit $h.\,l.\,\frac{a}{b}$ ideòque nulla discrepantia existit.

The first opponent produces one other similar argument against this question.

Contra tertiam.

1. Si Dei voluntas sit virtutis regula, cadit quæstio.
Sed Dei voluntas est, &c.
Ergo cadit quæstio.

2. Si Dei voluntas ideò nos astringat quia præmia pœnæque vitæ futuræ ex Dei arbitrio pendent, valet consequentia.
Sed Dei voluntas &c.
Ergo valet consequentia.

3. Si igitur, posito quòd angelorum malorum princeps summo rerum imperio potitus esset, voluntas ejus nos pari jure astringeret, valent consequentia et argumentum.
Sed, posito quòd &c.
Ergo valent consequentia et argumentum.

RESPONSUM.

Ut alia taceam, Deus homines felices vult; angelorum malorum princeps, miseros; huic ut resistamus, illi ut obediamus, ratio et natura suadent. Priusquam angelorum malorum princeps hominum felicitatem velle possit, naturam suam se exuat necesse est.

Against the third question one argument only is produced.

FINIS.

HENRY G. BOHN,

NOW OF

No. 4, YORK STREET, COVENT GARDEN,

HAS JUST PUBLISHED

A CATALOGUE

OF

A VERY CHOICE COLLECTION OF BOOKS,

ENGLISH AND FOREIGN,

Partly selected during an extensive tour on the Continent, partly from fine private libraries in this country: the whole offered at very moderate prices. The Catalogue comprehends above 4,000 articles of the first quality, in every department of literature, especially the fine arts, divinity, classics, and rare books, a great portion of them in rich old morocco bindings by De Rome, Desseuil, and Padeloup. Among the black letter and Aldine editions are many that have never before been heard of, and the Spanish collection is the best in this country. The price of the catalogue is 2s., but gentlemen sending their names, and the country trade applying free of postage, may obtain it gratis. It is particularly requested that the address be observed.

CALIFORNIA

PREFACE.

—

THE attempt is made, in the following pages, to render the bare rudiments of Deductive Logic intelligible to every person, of average intelligence, of either sex; in the hope that those rudiments may be adopted, for both sexes, as a regular part of mental training.

(1) Arithmetic,

(2) The First Book of Euclid,

(3) The Rudiments of Deductive Logic,

supposing that each is *intelligently taught and mastered*, form an excellent course of mental training: one, moreover, which may easily be given at Schools.

220699

PART I.

CHAPTER I.

OF THE ART OF LOGIC, so far as it will be treated of in the following pages, the purpose is TO LAY DOWN RULES WHEREBY TO DETERMINE—

1. *Any Proposition being assumed*[a] *to be true, what other Propositions must be maintained with it.*

2. *Any two or more Propositions being assumed*[a] *to be true, whether any, and, if any, what, other Propositions result from them.*

The former is the more generally applied. Rarely, if ever, in practice do we start from assumed Propositions in order to arrive at the resulting Proposition.

We take up Propositions from many different causes: when any one of these is challenged, we seek to discover those other Propositions by which it must be maintained.

For instance—our forefathers maintained (that) "Duelling is to be permitted."

Asked "Why?" they would have replied, (because) "It is socially expedient." Further pressed by "How so?" they would have said,

[a] Logic is concerned only with relative, not with absolute, truth, although incidentally it assists in arriving at the latter.

"It keeps up a sense of honour."
"It prevents bullying."
"It does much to equalise the weak and the strong."

Pressed again by "Well—what then?" they would have advanced the general assertions—

"Whatever keeps up a sense of honour,
..... prevents bullying,
..... does much to equalise the weak and the strong,
} is socially expedient."

What then is a Logical Proposition?

A sentence which asserts that a certain attribute (*or aggregate of attributes*) *does, or does not, exist in a certain Subject.*

Its parts are, necessarily, four:

Subject—whereof something is asserted.

Predicate—asserted of the Subject.

Copula—shewing whether such assertion is affirmative or negative.

Sign of quantity—shewing of how much of the Subject the Predicate is asserted.

The Copula ordinarily employed is the present Indicative of the Verb "to be"; and, for reasons to be hereafter noticed, no other tense.

But, inasmuch as the office of the Copula is simply to indicate relation between Subject and Predicate as ideas, and the verb "to be" implies, unavoidably, their existence as things,

We propose to employ Algebraic signs, i. e., for affirmative assertions + , for negative assertions — .

Examples of Logical Proposition in strict Form.

	Sign of Quantity.	Subject.	Copula.	Predicate.
(*a*)	Some	men	+	dishonest.
(*b*)	Some	war	—	righteous.
(*c*)	All	deceit	+	hateful.
(*d*)	All	birds	—	quadrupeds.

The word Predicate is unavoidably ambiguous.

It means—

1. *The thing or attribute predicated;* as, above, Dishonesty, Righteousness, &c.

2. *The Term predicated;* Dishonest, Righteous, &c.

Since "dishonest" means "having dishonesty,"
"righteous" .. "having righteousness,"
the assertion is the same when we say,
for (*a*) Dishonesty exists in some men,
for (*b*) Righteousness does not exist in some wars.

But our own language (as do many others) expressly avoids this form and employs the other.

By Predicate therefore, until further notice, we shall understand *a Term expressive of a class*

(1) in which the Subject is asserted to be, wholly or partially, included;

(2) from which the Subject is asserted to be, wholly or partially, excluded.

We have thus FOUR distinct classes of Logical Proposition,

1. AFFIRMATIVE, in which the Predicate includes the whole Subject.
2. ..... in which the Predicate includes only part of the Subject.
3. NEGATIVE, in which the Predicate excludes the whole Subject.
4. ..... in which the Predicate excludes only part of the Subject.

NOTE THAT

1 and 3 are called *Universal* { Affirmative, Negative.

2 and 4 .... *Particular* { Affirmative, Negative.

The SIGNS OF QUANTITY are

for Universal Propositions, ALL,
for Particular Propositions, SOME.

But NOTE THAT the usage of our own language necessitates a modification of the SIGN "ALL" in the case of a Negative Proposition.

Thus: of the Proposition "*All men — infallible,*" the true meaning is "*All men are excluded from the class 'Infallible.'*"

But, if it is translated into ordinary English and written, "*All men are not infallible,*" it would be taken as implying "*Some men are, and some are not, infallible.*"

For this reason only the SIGN OF QUANTITY in an Universal Negative Proposition is No or NONE: i. e. instead of

"The whole of the Subject is excluded from" } the Predicate.
"No part of the Subject is included in"

The SYMBOLS commonly used are,

for the Universal Affirmative, A.
..... Negative, E.
.. Particular Affirmative, I.
..... Negative, O.

and these Symbols are, as a matter of convenience, generally substituted for the longer form.

Examples.

SYMBOL.	SIGN OF QUANTITY.	SUBJECT.	COPULA.	PREDICATE.
A	All	men	+	mortal.
E	No	men	–	infallible.
I	Some	men	+	dishonest.
O	Some	men	–	dishonest.

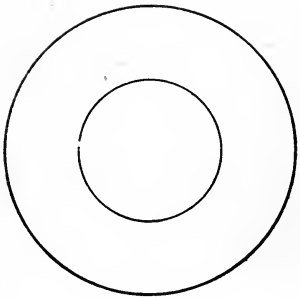
The relation of SUBJECT and PREDICATE in each may be illustrated thus:—

In A, by two concentric circles, the smaller representing the SUBJECT, the larger the PREDICATE.

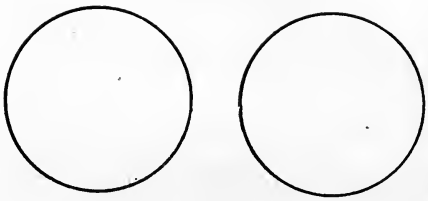
In E, by two circles, of any relative size, whose circumferences do not intersect each other.

In I and O, by two circles, of any relative size, whose circumferences do intersect each other.

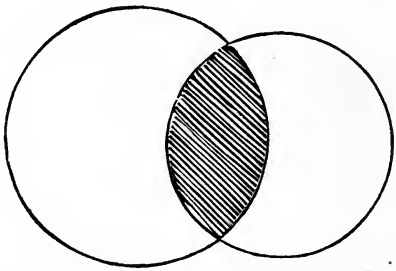
A



E



I or O



NOTE, I. that, since several grammatical words may be required to convey a single idea, SUBJECT *and* PREDICATE *may each consist of several such words, but will still be each* ONE TERM. Just as the same value may be represented by one gold coin, 20, 40, 60, or 80 silver ones, &c. &c.

Example.

"The annual labour of every nation	+	the fund which originally supplies it with all the necessaries and conveniences of life which it annually consumes."

Languages differ much in the power of concisely representing ideas.

Thus a Logical Proposition of which in Greek the SUBJECT and PREDICATE are each one word cannot be adequately expressed in English by words fewer than the following :—

SUBJECT.	COPULA.	PREDICATE.
"No man in whom Reason, after a struggle, holds in check the bodily Appetites	—	arrived at that state in which the bodily Appetites have been trained never to rebel against Reason."

II. *The Logical* SUBJECT *or* PREDICATE *is the same whatever may be the grammatical disguise.*

For instance,

"*Nothing is sweeter than honey*" = Honey + than which nothing is sweeter.

"*Fools make a mock at sin*" = All who make a mock at sin + Fools.

This may be more fully illustrated in translating from other languages. But in order to read our own correctly it is often essential to determine what is the Logical Subject or Predicate. Shall we lay the emphasis (above) on *Fools* or on *Sin?*

This is best exemplified *vivâ voce:* but Whately's example is excellent;

"The Organon of Bacon was not designed to supersede the Organon of Aristotle."

This proposition admits of as many interpretations as there are verbs and substantives in it: they are capable of being expressed by emphasizing each in turn.

CHAPTER II.

DISTRIBUTION OF TERMS.

A Term is said to be *distributed* when it denotes all that it is capable of denoting; *undistributed* when it denotes less.

All Terms are

either *Singular*—capable only of denoting an Individual;

or *Common*—capable of denoting many individuals and each of them.

A SINGULAR TERM is always distributed, because it cannot denote less than all the Individual. No Proposition being in strict Logical Form unless the sign of Quantity is prefixed, the distribution or non-distribution of THE SUBJECT is obvious at once: hence

Rule I. *All Universal Propositions distribute the* SUBJECT.
No Particular Propositions distribute the SUBJECT.

An Affirmative Proposition is "that in which the Subject is asserted to be, wholly or partially, included in the Predicate;" how much beside that Subject the Predicate is capable of including is immaterial: hence

Rule II. *No Affirmative Propositions necessarily distribute the Predicate:* it is therefore *assumed* that no such Propositions do distribute it.

Again, a Negative Proposition is "that in which the Subject is asserted to be, wholly or partially, excluded from the Predicate."

Now that from which any thing is excluded must be spoken of in its entireness.

(No amount of wire fencing will keep rabbits out of a flower garden, if a gap of six inches be left:) hence

Rule III. *All Negative Propositions necessarily distribute* THE PREDICATE.

Summary.

In E, *both* SUBJECT AND PREDICATE are distributed.
I, *neither* SUBJECT NOR PREDICATE are distributed.
A, THE SUBJECT *only* is distributed.
O, THE PREDICATE *only* is distributed.

OR,

E distributes both Terms,
I distributes neither,
A distributes the Subject *only*,
O distributes the Predicate *only*.

Simple as all this is, it should be thoroughly taken in by the memory before the learner goes any further.

This done, we may proceed to consider

CHAPTER III.

CONVERSION OF PROPOSITIONS.

A Proposition is CONVERTED,

When the Terms are transposed, the Copula remaining unchanged.

The only RULE is,

No Term may be distributed in the CONVERSE (*i.e.* Proposition, when converted) *which was not distributed in the original Proposition.* Hence

I. Since it is assumed that in no affirmative Proposition is the Predicate distributed, *the limiting* (*or Particular*) *sign* SOME *must be prefixed to the Subject of the Converse of every affirmative Proposition.*

II. Since in every Universal Negative Proposition both Terms are distributed,

No change of sign of Quantity is necessary in the Converse of any Universal Negative Proposition.

Examples.

A	All Squares	+	Rectangles.
I	Some Rectangles	+	Squares.
I	Some Parallelograms	+	Squares.
I	Some Squares	+	Parallelograms.
E	No Squares	−	Pentagons.
E	No Pentagons	−	Squares.

But, since the truth of every Universal Proposition implies the truth of the Particular Proposition having the same Subject, Copula, and Predicate, we may also say,

O Some Pentagons — Squares.

Summary.

A	after Conversion becomes	I.
I	after Conversion becomes	I.
E	after Conversion becomes	E.
E	after Conversion *may become*	O.

NOTE. Because I and E after Conversion remain unaltered as to sign of Quantity their Conversion has been usually distinguished by the name SIMPLE.

This, I think, is a mistake.

There is but one Rule and Method of Conversion, although the application of it produces a change in the form of A, none in that of I or of E.

But why is nothing said of O?

Because it cannot be converted. Its SUBJECT, not being distributed, would, by transposition, become distributed as PREDICATE of a Negative Proposition; and thus the only Rule of Conversion is at once broken by the act of transposition.

Example.

O Some Triangles — Equilateral.
Equilateral — Triangles.

The Term *Triangles*, undistributed as the SUBJECT of O, a particular Proposition, becomes distributed as PREDICATE of a Negative Proposition.

But although O is incapable of Conversion it is easily changed into an equivalent I, and that I is convertible.

Whatever x may stand for, all things are divisible into x and not-x. Therefore to assert that any SUBJECT is included in not-x is equivalent to asserting that it is excluded from x.

Example.

O Some Triangles — Equilateral
is equivalent to
I Some Triangles + not-Equilateral
whose Converse is
I Some not-Equilateral + Triangles.

The only difficulty in Conversion lies in bringing Propositions from their ordinary, colloquial or written, form into the strict Logical form; that is, really, in getting at their meaning. When a Proposition has been brought into the strict Logical form, the more mechanically the process of Conversion is performed the better; for the less is the chance of error.

But the difficulty is a real one; and in the overcoming it consists almost the only educational value of the process.

(A few examples are given; but any intelligent learner may easily multiply them to any extent. In each, the Proposition in its ordinary form is bracketed with the strict Logical, and the Converse subjoined.)

Better late than never.
A To do late + better than to do never.
I Some better than to do never + to do late.

	Only the good are happy.		
E	No not-good	—	happy.
E	No happy	—	not-good.

	Not every tale is to be believed.		
O	Some tales	—	to-be believed.
I	Some tales	+	not-to-be believed.
I	Some not-to-be believed	+	tales.

	All is not gold that glitters.		
O	Some glittering	—	gold.
I	Some glittering	+	not-gold.
I	Some not-gold	+	glittering.

	The story may be true.		
	That the story is true	+	possible.
	Some possible	+	that the story is true.

(The next two examples illustrate an *use* of Conversion.)

	Fools make a mock at sin.		
A	Fools	+	making a mock at sin.
I	Some making a mock at sin	+	Fools. (Vapid.)

	Fools make a mock at sin.		
E	No not-Fools	—	make a mock at sin.
E	None making a mock at sin	—	not-Fools.

i.e., "All who make a mock at sin are Fools;" *or*, "to make a mock at sin is a *proof* of folly."

	Self-love is not inconsistent with Benevolence.		
A	Self-love	+	not-inconsistent with Benevolence.
I	Some not-inconsistent with Benevolence	+	Self-love.

But the same may be asserted (ordinarily) of eating one's dinner.

	Self-love is not inconsistent with Benevolence.		
E	Self-love	—	inconsistent with Benevolence.
E	No inconsistent with Benevolence	—	Self-love.

Thus treated, the original Proposition is seen to contain an important Principle of Morals.

We have next to consider

CHAPTER IV.

OPPOSITION OF PROPOSITIONS.

To be OPPOSED, Propositions must

I. have exactly the same SUBJECT and PREDICATE;

II. differ

(*a*) in Sign of Quantity *only*,

(*b*) in Copula *only*,

(*c*) *both* in Sign of Quantity and in Copula.

In (*a*) the Opposition is called SUBALTERN.
In (*b*) CONTRARY.
In (*c*) CONTRADICTORY.

(It will, however, be seen afterwards that (*b*) is divided into CONTRARY and SUB-CONTRARY.)

It has been disputed, somewhat uselessly, whether the doctrine of Opposition involves Inference.

I think it sufficient to say that it teaches

"*Any one Proposition being assumed to be true or false, what may be known respecting others containing exactly the same* SUBJECT *and* PREDICATE."

The best way of arriving at its Laws is by experiment.

We must take account of what is termed the

MATTER OF PROPOSITIONS; *i.e.*, the relation which in the

nature of things exists, or which is supposed to exist, between any two Terms before they are placed in any Proposition.

This relation may be such, that

I. One term is invariably included in the other.

II. One term is invariably excluded from the other.

III. One term is sometimes included in, and sometimes excluded from, the other.

Two Terms standing in

Relation I. are said to be in NECESSARY
II. in IMPOSSIBLE } Matter.
III. in CONTINGENT

(NOTE ESPECIALLY that all the Propositions which can be formed with exactly the same SUBJECT and PREDICATE are in the same Matter. Thus, assuming that Man and Infallible are in IMPOSSIBLE Matter,

All men + Infallible (false),
No men − Infallible (true),
Some men + Infallible (false),
Some men − Infallible (true),

are all Propositions in IMPOSSIBLE Matter.)

On very slight consideration we find that

In NECESSARY Matter, A and I are true,
E and O are false.

In IMPOSSIBLE Matter, A and I are false,
E and O are true.

In CONTINGENT Matter, A and E are false,
I and O are true.

These facts are usually represented in the manner following, (N. I. C. denoting the kinds of Matter.)

N true I false C false	A	CONTRARIES.	E	N false. I true. C false.

SUBALTERNS. CONTRADICTORIES. CONTRADICTORIES. SUBALTERNS.

N true I false C true	I	SUB-CONTRARIES.	O	N false. I true. C true.

Reading horizontally at the top, we find that A and E are never both true, but may be both false.

Reading horizontally at the bottom, that I and O are never both false, but may be both true.

Reading diagonally, that { A and O / E and I } are never both true, and never both false.

Reading vertically downwards, that

where A is true, I is true;

where E is true, O is true.

Reading vertically upwards, that

where I is false, A is false;

where O is false, E is false.

Summary.

CONTRARIES cannot be both true, may be both false.

SUB-CONTRARIES cannot be both false, may be both true.

CONTRADICTORIES cannot be both false, cannot be both true.

In SUBALTERNS, the truth of the Universal implies that of the Particular;
the falseness of the Particular implies that of the Universal.

It is, perhaps, worth while to note that a Proposition having for its SUBJECT a Singular Term can only be opposed to its CONTRARY, since the Quantity of the Proposition cannot be altered.

Extracts from the remarks of Mr. Mill, on the Processes of Opposition and Conversion.—("System of Logic," 4th edition, pp. 184, 185.)

"In a manual for young students it would be proper to dwell at greater length on the CONVERSION and ÆQUIPOLLENCY of Propositions.

For, although that cannot be called Reasoning or Inference which is a mere reassertion, in different words, of what had been asserted before, there is no more important intellectual habit, nor any the cultivation of which falls more strictly within the province of the Art of Logic, than that of discerning rapidly and surely the identity of an assertion, when disguised under diversity of language. . . . . And the student of Logic, in the discussion even of such truths as we have cited above, acquires habits of circumspect interpretation of words, and of exactly measuring the length and breadth of his assertions, which are among the most indispensable conditions of any considerable mental attainment, and which it is one of the primary objects of Logical discipline to cultivate."

PART II.

CHAPTER I.

OF SYLLOGISM.

SYLLOGISM is *that kind of reasoning in which two, or more, Propositions being assumed*[a]*, some other Proposition must result from the Propositions so assumed.*

These Propositions may be

(*a*) CATEGORICAL, which assert absolutely; (for example, "A B + deserving of death.")

(*b*) HYPOTHETICAL, which assert the dependence of one Categorical Proposition upon another; for example, "If A B + traitor A B + deserving of death;"

or, "The assertion + either mistaken or malicious"

$$= \begin{cases} \text{If the assertion} - \text{mistaken it} + \text{malicious.} \\ \qquad\qquad\quad - \text{malicious it} + \text{mistaken.} \\ \qquad\qquad\quad + \text{mistaken it} - \text{malicious.} \\ \qquad\qquad\quad + \text{malicious it} - \text{mistaken.} \end{cases}$$

[a] See page 3.

We shall treat first of that kind of SYLLOGISM in which Categorical Propositions are assumed, and which is therefore named CATEGORIGAL SYLLOGISM.

Every SYLLOGISM consists of TWO PARTS:

I. *The Propositions assumed* = the ANTECEDENT.
II. *The Proposition necessarily resulting* = the CONSEQUENT.

The former is commonly called, "The PREMISES;" (more properly the Premisses, *i.e.* Propositiones Præmissæ.)

The latter is commonly called, "The CONCLUSION."

When, however, a Proposition is assumed, and the purpose is to find what other Propositions must be maintained with it[b], such Proposition is named "The QUESTION."

OF SIMPLE CATEGORICAL SYLLOGISM.

The simplest form of SYLLOGISM, from which the Rules of all may be gathered, is *that which consists*

of only two assumed Propositions = PREMISSES,
and of the Proposition necessarily resulting from them = CONCLUSION.

In order to *construct* such a SYLLOGISM, we must begin (as in all construction) from the bottom; *i.e.* from the QUESTION.

Is some A included in B?
Is all A included in B?
Is some A excluded from B?
Is all A excluded from B?

[b] See page 3.

The answer to each must be affirmative or negative; and it is to the answer that the name "the QUESTION" will henceforth be given.

To prove such QUESTION it is necessary to employ SOME THIRD TERM (say C), with which each Term of the QUESTION may (as it is commonly said) "be compared," *i.e.* stand as SUBJECT or PREDICATE in a Premiss.

Rule A.—To prove an AFFIRMATIVE QUESTION,

The THIRD TERM *must be such that each Term of the* QUESTION *can stand with it in an Affirmative Premiss.*

Rule B.—To prove a NEGATIVE QUESTION,

The THIRD TERM *must be such that one Term of the* QUESTION *can stand with it in an Affirmative Premiss, while the other stands with it in a Negative Premiss.*

Examples.

(1)	All	A	+ C.	(3)	All	A	+ C.
	All	C	+ B.		No	C	− B.
	All	A	+ B.		No	A	− B.
(2)	Some	A	+ C.	(4)	Some	A	+ C.
	All	C	+ B.		No	C	− B.
	Some	A	+ B.		Some	A	− B.

NOTE THAT in Syllogism (1)

B is the greatest, *i.e.* most comprehensive, Term employed:
A smallest, least
C, including A and being included in B, is, in respect of comprehensiveness, MIDDLE.

Hence, for convenience, in *all* SIMPLE CATEGORICAL SYLLOGISMS,

The Subject of the Question (or Conclusion) is named MINOR TERM.

The Predicate of the Question (or Conclusion) is named MAJOR TERM.

The Third Term employed in each Premiss is named MIDDLE TERM.

The PREMISSES are similarly named:

That in which the Major Term occurs is named MAJOR PREMISS.

That in which the Minor Term occurs is named MINOR PREMISS.

[The Student will do well to pause and refresh his memory of the Rules of Distribution of Terms in each kind of Proposition (see page 9) before he proceeds to consider]

CHAPTER II.

THE RULES OF SIMPLE CATEGORICAL SYLLOGISM.

Of these, those hereafter numbered 1, 2, 3, 6, 7 are obviously implied in the two given above for proving QUESTIONS, whether Affirmative or Negative.

1. *Three, and not more than three, distinct Terms may be employed.*

2. *Three, and not more than three, distinct Propositions may be employed.*

3. *The third (Middle) Term must not be ambiguous in itself.*

[Nor by its position.

Neither the SUBJECT of a Particular Premiss, nor the PREDICATE of an Affirmative Premiss, is distributed. But, unless the Middle Term has been once distributed, we cannot know that in each Premiss we are intending to use the *same* Term. If, on the contrary, it has been distributed in one Premiss, however small a portion of it may be intended in the other, that portion has been used before. Hence we have]

4. *The Middle Term must always be once distributed; i.e. it must be either the* SUBJECT of an Universal *or the* PREDICATE of a Negative } Premiss.

Examples of Middle Term Undistributed.

(1) All scarlet-fever-patients + having sore throat.
A B + having sore throat.
A B + scarlet-fever-patient.

(2) Some having sore throat + scarlet-fever-patients.
A B + having sore throat.
A B + scarlet-fever-patient.

In the first example, it is clear that the MIDDLE TERM "having sore throat" may include "All scarlet-fever-patients" and "A B," and yet the two latter Terms are not necessarily connected.

In the second, that one part of "having sore throat" may include "A B," while a different part may be included in "scarlet-fever-patients."

5. *Neither Term in the* QUESTION *(or* CONCLUSION*) may be distributed, unless it is also distributed in the Premiss in which it stands.*

The violation of this Rule is called ILLICIT PROCESS *of the Major Term* when the PREDICATE, *of the Minor Term* when the SUBJECT } is wrongfully distributed.

But the PREDICATE can only be distributed in a Negative Proposition, and the SUBJECT only in an Universal Proposition: consequently,

Illicit Process of the Major Term implies that the QUESTION (or CONCLUSION) is Negative when it ought to be Affirmative.

Illicit Process of the Minor Term, that it is Universal when it ought to be Particular.

The Conclusion ought to result necessarily from the Premisses. More cannot result from less (if a man owes me £5, I may not demand £6): less may result from more (if a man owes me £5, I may accept any less sum).

Consequently, it is not necessary that either Term in the QUESTION (or CONCLUSION) shall be distributed; although it may have been distributed in the Premiss in which it stands.

6. *Two Negative Premisses are inadmissible.*

Such case not being contemplated in Rules A or B.

7. *If either Premiss is negative, the Conclusion must be negative.*

Because, by the last Rule, the other Premiss must be affirmative, and Rule B applies.

8. *Two Particular Premisses are inadmissible.*

Suppose the Premisses to be I and I: then the Middle Term cannot be distributed.

Suppose them to be O and I, (since, by Rule 6, O and O are inadmissible.)

Since in O and I only one Term is distributed (and that *must* be the Middle Term), neither Term of the Conclusion can be distributed.

But by Rule 7 the Conclusion must be negative, since there is a negative Premiss. Therefore, the Major Term will be distributed in the Conclusion, undistributed in the Major Premiss: and then Rule 5 is broken.

Briefly. Two Particular Premisses must cause,
either *Non-distribution of the Middle Term;*
or *Illicit Process of the Major Term.*

9. *A Particular Premiss necessitates a Particular Conclusion.*

Such Particular Premiss must be I or O.

With I may be associated E or A (not I or O, both being Particular).

With O may be associated only A (not I or O, both being Particular; not E, being Negative).

The cases then will be,

1. { I distributing no Term / A only one. } — *Since the Middle Term must be distributed,* here no distribution is possible in the Conclusion, which must therefore, ex abundanti, be Particular.

2. { I distributing no Term / E two Terms. }

3. { O one only / A one only. } — In each of these cases *one* distribution is allowable in the Conclusion. But, by Rule 7, the Conclusion must be negative, *i.e.* distribute its Predicate: therefore, by Rule 5, the Subject may not be distributed.

MODES (OR MOODS) OF SIMPLE CATEGORICAL SYLLOGISM.

The Mode (or Mood) simply means *the enumeration of the Vowels symbolising the three Propositions of which a Simple Categorical Syllogism consists.*

Thus, on page 21,

The Mode of (1) is A A A.
(2) I A I.
(3) A E E.
(4) I E O.

The possible combinations of these four Vowels in threes are, of course, 64.

The Student will find it useful to make these combinations for himself; and then, in order to fix in his memory the chief General

Rules, to ascertain how many of such combinations are inadmissible when tested by those Rules.

Apply, *first*, the Rules affecting the Premisses, viz.

(*a*) Two Negative
(*b*) Particular } Premisses are inadmissible.

Next, the Rules regulating the dependence of the Conclusion on the Premisses, and of the Premisses on the Conclusion, viz.,

(*a*) A Negative Premiss necessitates a Negative Conclusion.
(*b*) A Conclusion implies Premiss.
(*c*) A Particular Premiss necessitates a Particular Conclusion.

It will be found that only 12 Moods survive the ordeal.

But the process is really superfluous; for we have next to consider

THE FIGURES OF SIMPLE CATEGORICAL SYLLOGISM.

The FIGURE of any such Syllogism *is determined by the position held in each of its Premisses by the (Third or)* MIDDLE TERM.

This may be	and the Figure is then named
Subject of both Premisses	Third.
Predicate of both	Second.
Subject of the Major Premiss / *Predicate of the Minor*	First.
Predicate of the Major Premiss / *Subject of the Minor*	Fourth.

(The Fourth Figure is useless, and may, in practice, be disregarded.)

Since each Premiss contains the Middle Term and one of the Terms of the Question or Conclusion, it is clear that *given the place held by the Middle Term, we know also the place, in its own Premiss, of either of the other two.*

The application of the General Rules of Syllogism to these known facts limits the capability of each Figure: these limitations have the name of SPECIAL RULES OF THE FIGURES.

It would be possible, of course, for the Student to discover these special Rules for himself; but the annexed Memoria Technica supplies them, and we need only concern ourselves with the proof of them.

[In making use of it, it must be understood that
the Symbol of the Major Premiss is placed first,
Minor second,
Conclusion last.

What denominates each Premiss is the presence of Major or of Minor Term: the order in which the Premisses are stated is, in itself, wholly immaterial. There are other uses of the Memoria Technica, which need not at present be noticed. *The Vowels in each Mood, and their order, is all we have now to regard.*

SIMPLE CATEGORICAL SYLLOGISM.

FIGURES OF:

	Subject.	Copula.	Predicate.	
Major Prem.	———		———	Fig. I.
Minor	———		———	
Conclusion	———		———	
Major Prem.	———		———	Fig. II.
Minor	———		———	
Conclusion	———		———	
Major Prem.	———		———	Fig. III.
Minor	———		———	
Conclusion	———		———	
Major Prem.	———		———	Fig. IV.
Minor	———		———	
Conclusion	———		———	

LEGITIMATE MOODS OF:

(Memoria Technica.)

I. BArbArA, CElArEnt, DArII, FErIO que *Prioris.*

II. CEsArE, CAmEstrEs, FEstInO, BArOkO, *Secundæ.*

III. *Tertia*—DArAptI, DIsAmIs, DAtIsI, FElAptOn, BOkArdO, FErIsOn, habet. *Quarta* insuper addit

IV. BrAmAntIp, CAmEnEs, DImArIs, FEsApO, FrEsIsOn.

Quinque subalterni * totidem Generalibus orti
[BArbArI, CElArOnt, CEsArO, CAmEstrOs, CAmEnOs,]
Nomen habent nullum nec, si benè colligis, usum.

* Conclusions being *Particular*, when they might have been *Universal.*

Assuming that this Memoria Technica is trustworthy, we will ascertain from it the Facts respecting each Figure.

Figure I. In each Mood

The first vowel is either A or E (not I or O);
hence, Fact 1—*The Major Premiss is always Universal.*

The second is A or I (not E or O);
hence, Fact 2—*The Minor Premiss is always Affirmative.*

The third is A, E, I or O;
hence, Fact 3—*The Conclusion is unrestricted.*

Applying the same kind of inspection to the remaining Figures we have the following results, viz.

Figure II.

Fact 1. *The Major Premiss is always Universal.*
2. *The Minor unrestricted.*
3. *The Conclusion always Negative.*

Figure III.

Fact 1. *The Major Premiss is unrestricted.*
2. *The Minor always Affirmative.*
3. *The Conclusion Particular.*

If these Facts can be accounted for, we shall prove them to be Rules.

In doing this it is necessary to remember,

(*a*) the position of the Middle and Major, Middle and Minor, Terms in the Premisses in each Figure;
(*b*) the chief general Rules of Simple Categorical Syllogisms: viz.

4. The Middle Term must be Subject of an Universal, or Predicate of a Negative, Premiss.
5. Against Illicit Process of Major or of Minor Term.
6. Two Negative Premisses are inadmissible.
7. A Negative Premiss necessitates a Negative Conclusion.
8. Two Particular Premisses are inadmissible.

Proofs of the Special Rules of the Figures.

Figure I. Rule 1.

The Minor Premiss must be Affirmative.

For suppose it Negative, then

(by Rule 6) the Major Premiss must be Affirmative,

(by Rule 7) the Conclusion Negative;

then the Major Term, undistributed as Predicate of the Affirmative Major Premiss, will be distributed as Predicate of the Negative Conclusion; and Rule 5 will be broken.

∴ *The Minor Premiss must be Affirmative.* Q. E. D.

Figure I. Rule 2.

The Major Premiss must be Universal.

For suppose it Particular, then

The Middle Term, holding the place of Subject, is not distributed; neither can it be distributed as Predicate of the Minor Premiss (which, by Rule 1, must be Affirmative), and Rule 4 will be broken.

∴ *The Major Premiss must be Universal.* Q. E. D.

Figure II. Rule 1.

One of the Premisses must be Negative.

Else Rule 4 will be broken, since the Middle Term is Predicate of both Premisses.

∴ *One of the Premisses must be Negative.* Q. E. D.

Corollary (by Rule 7),

The Conclusion must be Negative.

Figure II. Rule 2.

The Major Premiss must be Universal.

Since, by the Corollary to Rule 1, the Conclusion is Negative, the Major Term must be in it distributed; but as Subject of the Major Premiss it could not be distributed if that Premiss were Particular, and so Rule 5 would be broken.

∴ *The Major Premiss must be Universal.* Q. E. D.

Figure III. Rule 1.

The Minor Premiss must be Affirmative.

[Proof the same as for Figure I.]

Figure III. Rule 2.

The Conclusion must be Particular.

The Minor Term is Predicate of the Minor Premiss, which, by the last Rule, is Affirmative:

∴ the Minor Term is not therein distributed:

but if the Conclusion were Universal, the Minor Term (being its Subject) would be distributed, and thus Rule 5 would be broken.

∴ *The Conclusion must be Particular.* Q. E. D.

Summary of the Special Rules of the Figures.

FIGURE I.

(1) Minor Premiss Affirmative, *else* Illicit Process of Major Term.

(2) Major Premiss Universal, *else* Middle Term undistributed.

FIGURE II.

(1) One Premiss Negative, *else* Middle Term undistributed.

(2) Major Premiss Universal, *else* Illicit Process of Major Term.

FIGURE III.

(1) Minor Premiss Affirmative, *else* Illicit Process of Major Term.

(2) Conclusion Particular, *else* Illicit Process of Minor Term.

(It is well to charge the memory with thus much.

The Proofs will best be remembered by practising the statement of them.

If the Rules be forgotten, they may always be gathered as Facts from the Memoria Technica, if it be known, as it should be, by rote.)

At this point the Student will do well to exercise himself *thoroughly* in the Moods of Figures I, II, III.

Let him take Symbols as Terms, say

X for Minor Term,
Y Major ,
Z Middle ,

and construct Syllogisms, *beginning always from the* QUESTION.

Thus, suppose it be required to construct Syllogisms in dArII, fErIsOn, cEsArE, cElArEnt;

First, state the Quæstio, affix its symbol, add the name of the Mood required.

d Ar
I
I Some X + Y.

f Er
Is
On Some X — Y.

c Es
Ar
E No X — Y.

c El
Ar
Ent No X — Y.

Next, fill in Signs and Copulæ of the Premisses.

d Ar All +
I Some +
I Some X + Y.

f Er No —
Is Some +
On Some X — Y.

c Es No —
Ar All +
E No X — Y.

c El No —
Ar All +
Ent No X — Y.

Lastly, place the Middle Term, and then the Major and Minor Terms.

d Ar All Z + Y
I Some X + Z
I Some X + Y.

f Er No Z — Y
Is Some Z + X
On Some X — Y.

c Es No Y — Z
Ar All X + Z
E No X — Y.

c El No Z — Y
Ar All X + Z
Ent No X — Y.

When thus familiarised with the various Moods and Figures, he should proceed to construct Syllogisms with *significant* Terms in the Question.

FIRST, *Write down the Quæstio in strict Logical form* (i.e. Sign of Quantity—Subject—Copula—Predicate), *and affix the Symbol* (A, E, I or O).

NEXT, *Choose in what Mood of which Figure the Syllogism shall be constructed;* (remembering that no Affirmative Question can be proved in Fig. II; Universal in Fig. III).

NEXT, *as before, write down the name of that Mood.*

LASTLY, *fill in Signs and Copulæ, and place the Terms of the Question in their proper places, leaving void the place of the Middle Term.*

His Syllogism will then stand as in the following example:—

c El	No	—	valid.
Ar	This deed	+	
Ent	This deed	—	valid.

LOGIC *has now done all that it can, or proefsses to, do; it has shewn to what conditions the Third or Middle Term when found must conform.*

It does not profess to find Middle Terms; and, however absurd may be the Middle Term inserted, the *validity of the Inference* remains untouched: (although, of course, absurdity in the Conclusion arrived at guides the disputant to the absurd assumption or assumptions.)

Suppose I choose "Printed" as the Middle Term of the Syllogism above. If the Premisses are conceded the Conclusion must follow from them, and there would be no patent absurdity in the Conclusion.

If I want a really available Middle Term (or, as it used to be well named "Argument"), I must go to the legal practitioner, who would supply such as the following:—

"Insufficiently stamped"—"Not duly attested"—

"Obtained by fraud"—"Executed under compulsion."

Assuming him to know his business, the only chance of upsetting the Conclusion would be the possible falseness of the Minor Premiss.

Similarly, to prove "This man died of poisoning by arsenic," or "by strychnine," I must go to the medical man; and my only difficulty will be in the proof of my Minor Premiss.

What Moods and Figures to select must, after all, remain to be picked up by practice.

But in replying to a Syllogism the Rules of Opposition guide us.

If my adversary's Conclusion rests upon an Universal Premiss, I elect to prove, not its Contrary but, its Contradictory; which, if true, is incompatible with the truth of his Premiss and is easier of proof than the Contrary.

For this purpose, the third Figure is generally most convenient; because, as the Middle Term never stands as Predicate, a Singular Term will serve my purpose.

Say his Major Premiss has been—

"All Clerical Justices of the Peace are Liars;"

My answer would be,

f El A B	—	Liar.
Apt A B	+	Clerical Justice of the Peace.
On ∴ Some C. J. of P.	—	Liar.

Did I attempt to prove the Contrary of his Major Premiss I should find it difficult.

The analysis of Reasoning, as it is found in ordinary language, must be aided by instinct founded on practice.

It will generally be found easy to extract the Conclusion arrived at, state it in strict logical form, and then try it by the Rules.

Take for example the following:

"The cry of animals cannot always be depended upon as a proof that they are suffering pain. What a noise a pig will make when merely laid hold of!"

Here I take the statement controverted to be

A "All crying animals + suffering pain."

The laws of Opposition shew that the Contradictory is maintained by the writer,

O "Some crying animals − suffering pain."

I adopt the Mood fEl Apt On.

fEl No pigs merely laid hold of − suffering pain.
Apt All pigs ..... + crying animals.
O Some crying animals − suffering pain.

Or this,

"Those fellows not pirates! why, they'd British Bunting aboard! now they couldn't have bought it."

The position which the speaker lays down is,

A Those fellows + pirates.

The Syllogism is,

b Ar All having unbought, &c. + pirates.
b Ar Those fellows + having unbought, &c.
A Those fellows + pirates.

CHAPTER II.

OF ABBREVIATED OR ELLIPTICAL FORMS OF SYLLOGISM.

No one ever writes or speaks complete Syllogism.

The most usual form of ABBREVIATION is a Simple Categorical Syllogism, in the First Figure, from which one Premiss is omitted.

Speaking popularly, we either state the Principle and leave the Fact to be implied, or *vice versâ.*

Speaking technically, we either express the Major Premiss and leave the Minor Premiss to be implied, or *vice versâ.*

For example,

"Duelling is not socially-expedient: nothing morally wrong can be so."

Or,

"Duelling is not socially-expedient because it is morally wrong."

The Syllogism in its completeness being,

c El	No morally-wrong	—	socially-expedient.
Ar	All duelling	+	morally wrong.
Ent	No duelling	—	socially-expedient.

The Abbreviations above are named ENTHYMEME.

Some ENTHYMEMES admit of compression into a single Grammatical Proposition, which is then named ENTHYMEMATIC SENTENCE. Thus—

"Duelling being morally-wrong is not socially-expedient."

Another form of ABBREVIATION is that by which is omitted the Conclusion, sometimes one of the Premisses also, the person with whom we are arguing being presumed able to supply the omission.

This is chiefly applied to the third Figure.

Suppose my adversary's argument to have rested on, or his simple assertion to be,

"All rich people are hard hearted:"

I reply, "A. B. is not hard hearted, yet he is rich;"

or, "A. B. is not hard hearted."

"All eccentric people are clever:"

I reply, "A. B. is eccentric, but he is not clever;"

or, "A. B. is not clever;"

or, "A. B. is eccentric;"

accordingly as the presence of eccentricity or the absence of cleverness in A. B. is the more notorious.

The complete Syllogisms being respectively

	f El	A. B.	–	hard hearted.
	Apt	A. B.	+	rich.
	On	Some rich	–	hard hearted.
and	f El	A. B.	–	clever.
	Apt	A. B.	+	eccentric.
	On	Some eccentric	–	clever.

(The reason why this Figure of Syllogism is selected is that, since in this Figure alone the Middle Term is never Predicate, a Singular Term will serve the purpose.)

OF THE ABBREVIATION OF SEVERAL CONNECTED SIMPLE CATEGORICAL SYLLOGISMS.

A Question may require for its proof more than one Simple Categorical Syllogism: *i.e.*, one or both of its Premisses may become Questions in their turn. All the Syllogisms thus necessitated may be abbreviated in the form named

SORITES.

Sorites is *an abbreviation of two or more connected Simple Categorical Syllogisms in Figure I: in whose Antecedent the Minor Term is Subject of the first Premiss, the Major Term is Predicate of the last Premiss: the Middle Terms being alternately Predicates and Subjects of the Premisses.*

Example.

A B	+	human	}	*Antecedens.*
All human	+	animal		
All animal	+	living		
All living	+	corporeal		
No corporeal	−	immortal		
A B	−	immortal		*Consequens.*

Commencing with the Consequens (= Question or Conclusion) we obtain the following Simple Categorical Syllogisms :—

(The Figures 1, 2, 3, 4 denote the order of *Construction*; A, B, C, D the order of *Statement*.)

	c El	No corporeal	−	immortal.	
(D)	Ar	A B	+	corporeal.	(1)
	Ent	A B	−	immortal.	
	b Ar	All living	+	corporeal.	
(C)	b Ar	A B	+	living.	(2)
	A	A B	+	corporeal.	
	b Ar	All animal	+	living.	
(B)	b Ar	A B	+	animal.	(3)
	A	A B	+	living.	
	b Ar	All human	+	animal.	
(A)	b Ar	A B	+	human.	(4)
	A	A B	+	animal.	

Upon comparison of the Sorites with these Syllogisms into which it is expanded (1, 2, 3, 4) we find the following

FACTS OF SORITES.

1. The whole number of Propositions being 6,
   ..... Syllogisms is 4. (=the number of *intermediate* Propositions.)
2. All the *intermediate* Propositions are Major Premisses of Syllogisms in Fig. I.
3. The only *expressed* Minor Premiss is the first Proposition in the Sorites.
4. All the *suppressed* Minor Premisses are Conclusions, in each case, of the Syllogism immediately preceding.

Hence we derive the

RULES OF SORITES.

1. *Every Sorites may be expanded into as many Simple Categorical Syllogisms in Fig. I. as there are intermediate Propositions in it.*
2. *Every intermediate Premiss must be Universal* (by Special Rule 2 of Fig. I).
3. *The first Premiss alone may be Particular* (because it alone does not serve as a Major Premiss).
4. *No suppressed Conclusion may be Negative* (by Special Rule 1 of Fig. I).
5. *Nor any Premiss which produces a suppressed Conclusion* (by General Rule 7).
6. *The last Premiss alone may be Negative* (because the Conclusion which it produces is not used as a Minor Premiss).

Summary.

In the Antecedent of a Sorites

Only the first Premiss may be Particular.

..... last ..... Negative.

REDUCTION.

This name is given to *the process of changing any Simple Categorical Syllogism in Figures II, III (or IV), into an equivalent Syllogism in the First Figure.*

Except as an exercise it is useless, and belongs to an obsolete superstition that the First Figure is superior to the rest.

This is implied in the name REDUCTION or "bringing back." (Thus Hooker speaks of those who "reform a decayed estate by *reducing* it to the perfection from which it hath swerved.")

If a Syllogism in Fig. II or III is valid, nothing can be gained, though something may be lost, by torturing it into a Mood of the First Figure.

CHAPTER III.

OF HYPOTHETICAL SYLLOGISM.

HYPOTHETICAL SYLLOGISM is *that wherein one or more Propositions are hypothetical.*

HYPOTHETICAL PROPOSITION is *two, or more, Categorical Propositions welded into one by a Conjunction, or by Conjunctions.*

It is divided into

CONDITIONAL, *wherein two Categorical Propositions are connected by "If" placed before the first.*

DISJUNCTIVE, *wherein any number of Categorical Propositions are connected by "Or" placed between first and second, second and third, &c.*

Examples.

CONDITIONAL—"If A B committed the murder, A B deserves to be hanged."

DISJUNCTIVE—"A B is mad, or he is drunk, or he is a fool."

What is asserted in either form is the interdependence of the several Propositions.

Thus, in the first, it is not asserted that A B committed the murder, nor that he deserves hanging; but that, granting the first Proposition, the second will also be maintained.

Hence, the first is called ANTECEDENT,
second CONSEQUENT.

In the second, that some one of the three is maintained.

(It is plain that the Disjunctive Proposition may easily be stated in the Conditional Form.

If A B is mad, he is neither drunk nor a fool.

If A B is not mad, he is either drunk or a fool, &c.

Hence it is only necessary to give Rules for)

CONDITIONAL SYLLOGISM.

That most in use is *that wherein the Major Premiss is Conditional, and Minor Premiss and Conclusion may be Disjunctive.*

It is divided on two principles,

a. ACCORDING TO THE NATURE OF THE MAJOR PREMISS.

(1) If this consists of *one* Conditional Proposition, the Syllogism is called SIMPLE.

(2) If of *more,* the Syllogism is called COMPLEX.

b. ACCORDING TO THE NATURE OF THE MINOR PREMISS.

(1) If this is *Affirmative,* the Syllogism is called CONSTRUCTIVE;

(2) If *Negative,* DESTRUCTIVE.

We have thus—

Simple { Constructive. / Destructive.

Complex { Constructive. / Destructive.

THE RULES OF SIMPLE CONDITIONAL SYLLOGISM

Are derived from those of Simple Categorical Syllogism.

Every Universal Affirmative Proposition may be exhibited in the Conditional Form; thus,

"All good + happy" = "If A B + good, A B + happy."

We will therefore make four simple Categorical Syllogisms with the Major Premiss, "All good + happy;" and bracket with it its equivalent Conditional.

	If A B + good, A B + happy	
bAr	All good + happy	(1)
bAr	A B + good	
A	A B + happy.	
	If A B + good, A B + happy	
A	All good + happy	(2)
A	A B + happy	
A	A B + good.	
	If A B + good, A B + happy	
cAm	All good + happy	(3)
Es	A B — happy	
trEs	A B — good.	
	If A B + good, A B + happy	
A	All good + happy	(4)
E	A B — good	
E	A B — happy.	

Examining these as Categorical Syllogisms, we find that

(1) is correct in Barbara;

(3) Camestres;

(2) is faulty, being in Figure II without a negative Premiss;

(4) is faulty, being in Figure I with a negative Minor Premiss.

Then *taking them as Conditional Syllogisms,* we find that

(1) is *Constructive;* and that, the Minor Premiss having affirmed the Antecedent, the Conclusion has affirmed the Consequent:

(3) is *Destructive;* and that, the Minor Premiss having denied the Consequent, the Conclusion has denied the Antecedent.

The Rules therefore of Conditional Syllogism are,

1. *If the Antecedent is affirmed, the Consequent must be affirmed.*

2. *If the Consequent is denied, the Antecedent must be denied.*

(2) in which the Consequent is affirmed,
(4) in which the Antecedent is denied,
} are *both invalid.*

THE RULES OF COMPLEX CONDITIONAL SYLLOGISM.

The same Rules apply to Complex Conditional Syllogism, with this addition, that, whenever the Major Premiss has more than one Antecedent, or more than one Consequent, the affirmation or denial in the Minor Premiss and in the Conclusion must be *Disjunctive.*

1. If the Antecedent is affirmed (categorically or disjunctively), the Consequent must be affirmed (categorically or disjunctively).

2. If the Consequent is denied (categorically or disjunctively), the Antecedent must be denied (categorically or disjunctively).

We will next give two or three Examples of that kind of Complex Conditional Syllogism which is most often employed.

A (1).

Major Premiss { If this counsel + from above It + irresistible.
If this counsel + from man It + sure to fail.

Disjunctive Minor Prem. { either, This counsel + from above,
or, This counsel + from man.

Disjunctive Conclusion { ∴ either, This counsel + irresistible,
or, This counsel + sure to fail.

A (2).

Major Premiss { If this counsel + irresistible, / If this counsel + sure to fail, } It + to be let alone.

Disjunctive Minor Prem. { either, This counsel + irresistible, / or, This counsel + sure to fail;

Categorical Conclusion { ∴ This counsel + to be let alone.

B (1).

Major Premiss { If a Monarch + uncontrolled He + Tyrant. / If a Monarch + controlled He + Cypher.

Disjunctive Minor Prem. { either, a Monarch + uncontrolled, / or, a Monarch + controlled;

Disjunctive Conclusion { ∴ either, He + Tyrant, / or, He + Cypher.

B (2).

Major Premiss { If a Monarch + Tyrant, Monarchy + dangerous. / If a Monarch + Cypher, Monarchy + useless.

Disjunctive Minor Prem. { either, A Monarch + Tyrant, / or, A Monarch + Cypher;

Disjunctive Conclusion { ∴ either, Monarchy + Dangerous, / or, Monarchy + Useless.

B (3).

Major Premiss { If Monarchy + dangerous, / If Monarchy + useless, } Monarchy + to be abolished.

Disjunctive Minor Prem. { either, Monarchy + dangerous, / or, Monarchy + useless ;

Categorical Conclusion } ∴ Monarchy + to be abolished.

C.

Major Premiss { If I + in training, I + unable to read. / If I − in training, I + unable to pull at Putney.

Disjunctive Minor Prem. { either, I + in training, / or, I − in training ;

Disjunctive Conclusion { ∴ either, I + unable to read, / or, I + unable to pull at Putney.

(1) In Syllogisms A (1), B (2) and (3), and in C,

The Major Premiss consists of *two* Conditional Propositions whereof each has a different Antecedent and a different Consequent; and, the Minor Premiss disjunctively affirming the Antecedents, the Conclusion disjunctively affirms the Consequents.

Each is an Example of Constructive Dilemma.

Three points are to be noticed—

1. The Logical Validity.
2. The Material .....
3. The Rhetorical ....

1. *The Logical Validity* of these (as of any other) Syllogisms depends upon the observance of the Logical rules of inference: *i.e.* the Premisses being assumed *must* the Conclusion be admitted?

2. *The Material Validity* depends on the truth of the Minor Premiss; in other words, on the Minor Premiss really exhausting all possible alternatives; hence, the name DILEMMA (etymologically "double assumption," or, possibly, "two choices") is *sometimes extended to all complex conditional Syllogisms in which the Minor Premiss exhausts all alternatives:* but we popularly speak of the "horns" of a Dilemma.

In Syllogism A (1), and in C, the Minor Premiss is indisputable.

In Syllogism B (1), and (derivatively) in B (2), the Minor Premiss is disputable; for a Monarch need not be wholly controlled, or wholly uncontrolled.

The Rhetorical Validity consists in the equal unacceptableness, *to our opponent,* of the alternative conclusions.

In this view A (1), B (2), and B (3) are *rhetorically* valid.

But in C, the first alternative is unacceptable to the youth's Parent, Guardian, or Tutor; the second only to himself, or, possibly, to the Captain of the University Boat.

A (2) and B (3) are CONSTRUCTIVE COMPLEX CONDITIONAL SYLLOGISMS, wherein the Major Premiss consists of two Conditional Propositions, each having a different antecedent but a common consequent; the advantage of this form being that the single consequent rests on two alternatives, one of which it has been shewn must be true.

(*Rhetorically*, however, neither of these Syllogisms would be expressed, because they blunt the edge of the Dilemmas.)

Of course any Complex Conditional Syllogism, and therefore any Dilemma, may be in the Destructive Form.

CHAPTER IV.

OF FALLACY.

A Fallacy is an Argument which affects to be valid, but is not,

a. Either because some Logical Rule has been violated;

b. Or, Because a false Premiss has been assumed.

Beyond this it is not intended to classify or give names to Fallacies.

An example of each is subjoined.

A.—1. *Faulty Conversion.*

All clever men	+	eccentric.	A
∴ All eccentric men	+	clever.	A

Whereas all that is implied is that

Some eccentric men	+	clever.	I

2. *Faulty Opposition.*

All testimony to miracles	+	to be accepted.	A	false.
∴ No testimony to miracles	−	to be accepted.	E	false.

Instead of

Some testimony to miracles	−	to be accepted.	O	true.

B.—*False Premiss.*

All who are red in the face, and breathe stertorously + drunk.

A B + red in the face, &c.

∴ A B + drunk.

(*The Police Fallacy.*)

The Major Premiss is not true.

It is grounded really upon the faulty Conversion of

"All drunk + red in the face," &c.

It was stated (on Page 2) that no other than the *present* Tense of the verb "TO BE" is admissible as Copula. The reason is that any variation amounts to introducing one other Term at least.

Thus (Whately)—

All civilised are whites.

The Gauls were whites.

∴ They were civilised.

Besides the fault involved in the non-distribution (by Rule 1 of Figure II) we have here five Terms instead of only three.

(1) (2)
All who are civilised + whites.

(5) (3)
The Gauls + people who were whites.

(5) (4)
The Gauls + people who were civilised.

PART III.

CHAPTER I.

THE laws of Syllogism may be illustrated by the use of Symbols only; and wherever hitherto we have employed *significant* Terms it has been assumed that such Terms were unambiguous. In practice, however, this is not so. A wise reasoner will always insist that the Terms of the QUESTION shall be distinctly understood, before the discussion begins, by himself, and also (if so be) by the other party to the discussion.

But, even so, the MIDDLE TERMS subsequently introduced may be either in themselves ambiguous, or not understood in the same sense by both disputants.

It is essential to all right Reasoning that every Term employed shall be clearly *defined:* the ultimate purpose, therefore, now in view is to ascertain the LAWS OF LOGICAL DEFINITION.

OF PREDICABLES.

It was stated (Page 3) that the word PREDICATE is unavoidably ambiguous, and means either *the attribute Predicated,* or *the Term Predicated.*

Any Term predicated must be capable of being predicated, *i.e.* (a) PREDICABLE.

What then constitutes this PREDICABILITY?

1. The power of CONNOTING (signifying the presence of) some Attribute, or aggregate of Attributes, in a Subject.
2. The power of DENOTING (being the common name of) any and every Subject in which such Attribute &c. exists, or is, by the person using the Term, supposed to exist.

Every PREDICABLE is said to be,
in right of the first power, a CONCRETE
..... second ....., a COMMON } Term.

[The Student must here be reminded that by TERM is meant the verbal representative of (and practically the substitute for) an Idea, simple or complex; whether such Idea be, in any given language, capable of being expressed by one or by more grammatical words. It is simply for convenience that, in illustration, such Ideas are chosen as can be expressed by one grammatical word: just as it is sometimes more convenient to use one coin, cheque, or note, instead of many coins of equal value.]

Thus Hard, Solid, Just, Dishonest, are

CONCRETE TERMS, because they signify the presence of the Attributes Hardness, Solidity, Justice, Dishonesty;

COMMON TERMS, because they may be the common name of any and every Subject in which these Attributes respectively exist, or are supposed to exist.

Hardness, Solidity, Justice, Dishonesty, are named ABSTRACT TERMS, because they denote Attributes conceived of as existing apart from any Subject.

But how are the Ideas of these Attributes arrived at?

By means first of our Senses, next of our Intellect, we perceive similar Quality, Attribute (or aggregate of these), in several instances; this similarity we assume to be identity, and thus gain an Idea, which is thereafter *abstracted, i.e.* viewed independently of all other attendant circumstances in each instance.

Thus almost, probably quite, from the moment of birth an Infant receives an impression from contact with some substances wholly different from that which it receives by contact with others. It thus gradually gains the ABSTRACT IDEAS represented by the Abstract Terms—Hardness, Solidity, Sweetness, Softness.

When intellectual and moral perception awakes, the Child receives, through those media, by reflexion on some actions impressions wholly different from those received by reflexion on others. It thus gains gradually the ABSTRACT IDEAS represented by the ABSTRACT TERMS—Kindness, Crossness, Rightness, Wrongness.

The ABSTRACT TERMS are in each case exchanged (for convenience) for the CONCRETE TERMS which *connote,* instead of *denoting,* the Abstract Ideas.

The statements—

"Nurse is { cross," / unkind," / kind," / unjust,"

take the place of the statements—

{ "crossness / "unkindness / "kindness / "unjustness } exist in Nurse."

And these CONCRETE TERMS are thenceforward ready to be applied to (*i.e. denote,* be the common name of, be predicated of) any substances or actions which, in the child's judgment, resemble those from which respectively the ABSTRACT IDEAS were gained.

(Those who have watched the ways of children will have noticed how apt they are to apply to every quadruped of a certain size the name, generally unintelligible, which they have once given to any one such quadruped.)

It cannot, of course, be *proved* that an infant or a child goes through any of these mental processes, since we all forget our first experiences in infancy and childhood.

But let any grown-up person try the experiment of finding a COMMON NAME which shall be applicable to (*i.e. Predicable of*) every thing upon a well-littered study-table, from which shall be supposed to be excluded all raw products and all forms of animal or vegetable life.

Consciously or unconsciously, he must go through the process of ABSTRACTION: which has been well defined, by

Aldrich, as "*the regarding in a number of individual objects* ONLY *their points of agreement.*"

Say that the point he fixes upon is "manufactured-ness."

He must at least have put out of view such differences as the following:

a. Some belong to the animal kingdom, some to the mineral, some to the vegetable.

b. The various uses for which each is made.

Next let an orange be placed on the table,
or his favorite kitten jump up on it,
or a spider drop on it.

If he is to frame a Term which shall be predicable of these new objects as well as of those which were there before he must repeat his ABSTRACTION; *i.e.* he must discard more *differences.*

Or, let us take the quadrilateral plane rectilineal Figures defined in the first book of Euclid—

To give a common Name to	*must be dropped*
(1) Square and Rectangle . .	Equilateral-ness.
(2) Square and Rhombus . .	Right-angled-ness.
(3) Square, Rectangle, Rhombus, Rhomboid . .	both Attributes named above.

Summary.

Every PREDICABLE TERM must be—

A. *Concrete.*

B. *Common.*

In the first capacity it is a grammatical device for superseding an awkwardness of Language. (See Page 3.)

In the second it has three functions;

1. It *connotes.*
2. It is *capable of denoting.*
3. (As soon as predicated, but not before,)

It actually denotes any and every Subject of which it is predicated.

(Printed labels *connote* as soon as printed:

..... *can denote* any and every vessel containing the substance connoted.

..... *do denote* only those vessels to which they are actually attached.)

Since the ABSTRACT IDEA connoted by a PREDICABLE is gained only by discarding differences, it follows that

The more Attributes any Predicable connotes the fewer Individuals can it denote (and vice versâ).

Thus—

SQUARE *connotes all that* RECTANGLE does + another Attribute.

RECTANGLE ..... PARALLELOGRAM does + ...

PARALLELOGRAM ..... PLANE QUADRILATERAL / RECTILINEAL FIGURE } does + ...

But

PLANE QUADRILATERAL / RECTILINEAL FIGURE } *can denote* more Figures than PARALLELOGRAM can.

PARALLELOGRAM ..... RECTANGLE can.

RECTANGLE ..... SQUARE can.

CHAPTER II.

—

CLASSIFICATION OF PREDICATED PREDICABLES.

PREDICATED PREDICABLES are classified according to the relation subsisting (or by the Predicator conceived to subsist) between

1. The ABSTRACT QUALITY (or Attribute) *connoted* by any Predicable, and
2. The SUBJECT of which it is actually predicated (*i.e.* which it actually *denotes*).

Thus "Cold" always connotes "Coldness."

But in the following Propositions,

Air + Cold,
Ice + Cold,

the relation of Coldness to Air is contingent,

..... Ice is necessary;

consequently the Predicable "Cold," when Predicated in the one of these Propositions, will have a name different to that which it will have when Predicated in the other.

If the abstract quality, connoted by the Predicable, be (or by the Predicator be conceived to be) of the Subject denoted by it	*The Predicable is named*
1. The whole Essence	1. Species.
2. Part common (of the whole Essence) . . .	2. Genus.
3. Part distinctive (of the whole Essence) . . .	3. Differentia.
4. Joined (to the whole Essence) necessarily	4. Proprium.
5. Joined (to any Individual in whom the whole Essence exists) contingently	5. Accidens.

NOTE.—By the word ESSENCE is meant the aggregate of those ideas which, in the view of the Predicator, make up the idea of the Subject.

> Logic is the Judge, whose province is to lay down the law; not the Jury, whose province is to determine whether a particular set of facts fall under a particular law.

Therefore, in any illustrations which may be given in this part of the Treatise, I regard it as immaterial whether, as matters of fact, such illustrations are unimpeachable: that is a question which, if I may be allowed so to express my meaning, I do not allow to be raised.

Examples.

Suppose that I have before me any number of Plane Rectilineal Quadrilateral Figures, *agreeing* in that their opposite sides are parallel, *differing* in that some are rectangular and equilateral, some rectangular but not equilateral, some equilateral but not rectangular, some neither

equilateral nor rectangular; the greatest amount of agreement I can find by Abstraction (*i.e.* by discarding all differences) is *that they are, each and all, Plane Rectilineal Quadrilateral Figure, having the opposite sides parallel:* or, in one word, "Parallelogram-ness." I convert this Abstract Term into the Concrete "Parallelogram," which then becomes Predicable of each and all.

I proceed to Predicate it thus:—

All these Figures + Parallelogram.

The name of the Predicable in this Proposition is GENUS, because the Abstract Term connoted conveys to my apprehension all the ideas common to the differing Figures.

Suppose that I then make a selection and say,

All these Figures	+	Square,
All those	+	Rectangle,
All these	+	Rhombus,
All those	+	Rhomboid,

the name of each of these Predicables will be SPECIES, because each connotes all the ideas which, to my apprehension, make up the idea of the Subject of which it has been predicated.

If I say,

This Rectangle	+	6 inches long × 4 deep,
This Square	+	9 inches .... × 9 ....

the name of the Predicables will be ACCIDENS, because the ideas connoted do not enter into my conception of the idea represented by Rectangle or Square.

If I say,

All Parallelogams + having opposite sides and angles equal,

the name of the Predicable will be PROPRIUM, because the idea connoted by it is joined necessarily to that aggregate of ideas which make up my idea of the Subject of which it is predicated, but does not form one of that aggregate.

If I say,

All circles + { having a point within from which all lines drawn to the circumference are equal,

the Predicable will be named DIFFERENTIA, because the idea connoted by it is that part of the idea of the Subject which distinguishes it from all other Plane Figures contained by one line.

NOTE.—Whether the name DIFFERENTIA or PROPRIUM shall be given to any Predicated Predicable, depends entirely on the conception formed by the Predicator of the relation between the quality connoted by the Predicable, and the idea he has formed of the Subject of which it is predicated.

Thus it has long been assumed that *Rationality* is a quality universally and exclusively forming the distinctive part of the Essence of Man.

In this view *Rational*, when Predicated of Man, will be named DIFFERENTIA.

Others may think that *Articulate-speech* is the distinctive part of the Essence of Man.

In this view *Articulately-speaking*, when Predicated of Man, will be named DIFFERENTIA; whereas, under the first supposition, it will be named PROPRIUM.

Since all Squares, Rectangles, Rhombi, Rhomboids are Parallelogram, it is plain that whatever may be predicated of Parallelogram may also be predicated of each of the other Figures.

This necessitates *subdivision of the first four Classes of Predicables given above;* viz. SPECIES, GENUS, DIFFERENTIA, and PROPRIUM.

To make this part of the Subject clear, we must make a set of COGNATE PREDICABLES, *i.e. Predicables connoting Abstract Ideas gained by analysing one Complex Idea.*

For this purpose it is advisable to adhere to the old established example.

Let us then take *any* individual Men, (say)

Nero, John Bunyan, Napoleon I.

Let it be assumed that

The whole Essence of these—"the whole that any *common* Term can express" (Whately)—is Humanity;

		PART COMMON	+	PART DISTINCTIVE.
that Humanity is divisible into		Animality	+	Rationality,
.... Animality	.....	Life	+	Sentience,
.... Life	.....	Corporeity	+	Vital Principle,
.... Corporeity	.....	Substance	+	Form,
.... Substance is indivisible.				

Let it be further assumed that to

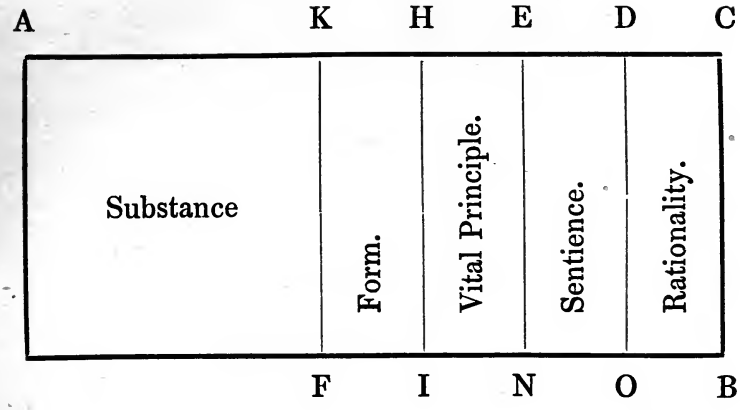
Humanity is necessarily joined		Power of Speech,
Animality	.....	Spontaneous Motion,
Life	.....	Requirement of Sustenance,
Corporeity	.....	X. Y. Z.
Substance	....	Palpability;

it is clear that in the one complex idea HUMANITY are involved, at least,

Rationality,
Animality,
Life,
Sentience,
Corporeity,
Vital Principle,
Substance,
Form,
Power of Speech,
Spontaneous Motion,
Requirement of Sustenance,
X. Y. Z.
Palpability ;

and that Predicables connoting each of these Abstracts may be Predicated of All Men,
or, of Humanity.

The annexed Diagram illustrates this process of continued Abstraction.



Let

AB = Humanity, divided into AO = Animality and DB = Rationality.

AO = Animality, ... AN = Life ..... EO = Sentience.

AN = Life, ... AI = Corporeity .... HN = Vital Principle.

AI = Corporeity, ... AF = Substance .... KI = Form.

AF = Substance (assumed to be) indivisible.

At each step, it will be seen, is dropped the *Part Distinctive*, ... left ..... *Common;* the latter being again divided until is left an Idea (which we assume to be) incapable of further analysis.

The Ideas *joined necessarily* to AB, AO, AN, AI, AF may be conceived of as *welded externally* to each.

Of the Ideas *joined contingently* to Individuals who partake of AB &c. we take no account.

It will be convenient next to exhibit side by side

(*a*) the results of this continued Abstraction; and

(*b*) the Predicables which connote them.

Since it is assumed that

"Need of sustenance" is *necessarily joined* to the Essence of "Life;"

"Needing sustenance" will be called, when predicated of "all Living," PROPRIUM (simply); when predicated of

"All Animal," or
"All Human," } GENERIC PROPRIUM.

Again, "Vital Principle" being assumed to be *the Part Distinctive* of the Essence of "Life," "Having Vital Principle" (*i.e.* "Animated") will be called,

when predicated of "All Living," SPECIFIC DIFFERENTIA;

..... { "All Animal," / "All Human," } GENERIC DIFFERENTIA.

"Corporeity" being assumed to be *the Part Common* of the Essence of "Life," "Corporeal" will be called,

when predicated of "All Living," GENUS (simply);

..... { "All Animal," / "All Human," } REMOTE GENUS.

AGAIN, since it is clear that

All Human	+	Animal,
All Animal	+	Living,
All Living	+	Corporeal,
All Corporeal	+	Substantial;

those cognate Predicables which are alternately Predicates and Subjects are called GENERA when Predicated, SPECIES when they are Subjects;

for Animality is the part common of the Essence of Humanity,

Life	.....	Animality,
Corporeity	.....	Life,
Substance	.....	Corporeity.

That one Predicable which does not, and on our assumption cannot, become a Subject is called GENUS SUMMUM.

That which does not become a Predicate (but is Predicable of Individuals only) is called SPECIES simply (sometimes *Infima*).

TERMS REPRESENTING ABSTRACT IDEAS.

Joined necessarily to the whole Essence.			*Part Common.*	*Part Distinctive.*
Palpability	∝	Substance		
X. Y. Z.	∝	Corporeity	= Substance	+ Form
Need of Sustenance	∝	Life	= Corporeity	+ Vital Principle.
Spontaneous Motion	∝	Animality	= Life	+ Sentience
Power of Speech	∝	Humanity	= Animality	+ Rationality

Nero, John Bunyan, Napoleon I.

THE CONCRETE TERMS, *i.e.* PREDICABLES.

Propria.		*Genera.*	*Differentiæ.*
Palpable	∝ Substantial		
Having X. Y. Z.	∝ Corporeal	= Substantial	+ Formed.
Needing Sustenance	∝ Living	= Corporeal	+ Animated.
Spontaneously Moving	∝ Animal	= Living	+ Sentient.
Having Power of Speech	∝ Human	= Animal	+ Rational.

Nero, John Bunyan, Napoleon I.

Thus we obtain four additional classes.

If the Quality *connoted* by any Predicable be (or be conceived of as being) of the Subject *denoted* by it,	The Predicable is named
1. Part of the Part Common of the whole Essence, . . .	1. *Remote* GENUS.
2. Distinctive Part of Part of the Part Common of the whole Essence, . . .	2. *Generic* DIFFERENTIA.
3. Necessarily joined to Part of the Part Common of the whole Essence, . . .	3. *Generic* PROPRIUM.
4. Indivisible Part of the Part Common of the whole Essence, ...	4. *Summum* GENUS.

FOR EXAMPLE,

(*a*) "Every Hexagon + having its interior angles equal to twice as many right $\angle s - 4$ as it has sides,"—(*Generic* PROPRIUM.)

The Quality here predicated belongs to a Hexagon, because

"Every Hexagon + Plane Rectilineal Figure;"

but it is necessarily joined to the whole Essence of Plane Rectilineal Figure.

(*b*) "Every Square + having opposite sides Parallel,"—
(*Generic* DIFFERENTIA,)
because the Predicable is DIFFERENTIA when Predicated of Parallelogram, and Parallelogram is *Remote* GENUS when Predicated of Square.

(*c*) "Every Square + Plane Figure."—(*Remote* GENUS.)
(*d*) ..... + Figure,"—(*Summum* GENUS.)

CHAPTER III.

OF LOGICAL DIVISION AND OF LOGICAL DEFINITION.

Both of these apply to TERMS: the need for either arises simply from the fact that Language is practically the only means whereby we can convey to one another (perhaps even to our own minds) Ideas.

When a Term *denotes too widely* we must DIVIDE.
..... *connotes too much* ..... DEFINE.

Thus, FIGURE denotes too widely, and must be Divided;
..... SQUARE connotes too much, and must be Defined.

Construct, from any number of Individual Squares, a table of COGNATE PREDICABLES (omitting Propria).

		Genus.	*Differentia.*
Figure			
Plane Figure	=	Figure	+ Contained by line or lines.
Plane Rectilineal Figure	=	Plane Figure	+ Contained by straight lines.
Plane Quadrilateral Rectilineal Figure	=	Plane Rectilineal Figure.	+ Contained by four lines.
Parallelogram	=	Plane Quadrilateral Rectilineal Figure	+ Having opposite sides parallel.
Rectangle	=	Parallelogram	+ Right-angled.
Square	=	Rectangle	+ Equilateral.

A B C
(Individual Squares.)

By adding to	*The Term*	*We Divide*	*into*	*constitute the Class*
Figure	Plane	Figure	Plane and not-Plane	Plane Figure.
Plane Figure	contained by straight lines	Plane Figure	Plane Figure contained by one line, and not contained by one line	Plane Rectilineal Figure.
Plane Rectilineal Figure	Quadrilateral	Plane Rectilineal Figure	Quadrilateral and not Quadrilateral	Plane Rectilineal Quadrilateral Figure.
Plane Rectilineal Quadrilateral Figure	having the opposite sides parallel	Plane Rectilineal Quadrilateral Figure	Parallelogram and not-Parallelogram	Parallelogram.
Parallelogram	Right-Angled	Parallelogram	Rectangle and not-Rectangle	Rectangle.
Rectangle	Equilateral	Rectangle	Square and not-Square	Square.

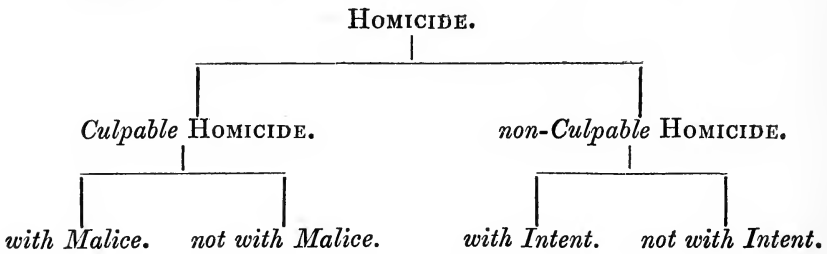
[We do not attempt to divide Square because we could only do so by adding ACCIDENS instead of, as in all preceding instances, DIFFERENTIA.

But if, by the same process, we had constituted the Class HUMAN, custom (not Logic) would allow of our adding Accidents such as connote Nationality, Profession, Trade, &c. &c., and constituting such Classes as French, German, Lawyer, Soldier, Merchant.]

We should thus have *divided* FIGURE into the Classes underwritten:

Solid Figure.
Circle.
Ellipse.
Non-Quadrilateral Rectilineal.
Trapezium.
Parallelogram, neither Rectangular nor Equilateral.
Rectangle.
Square.

Again,—



Here we have divided HOMICIDE into

Culpable with Malice . . . . = MURDER.
Culpable not with Malice . . . = MANSLAUGHTER.
Non-Culpable with Intent . . = JUSTIFIABLE.
Non-Culpable not with Intent . = HOMICIDE BY MISADVENTURE.

THE RULES OF LOGICAL DIVISION are,

1. *The Term which has been divided must be Predicable, of each of the Classes into which it has been divided, as* GENUS *or* REMOTE GENUS.
2. *No one of these Classes must* DENOTE *more than the Term divided.*
3. *These Classes must, in the aggregate,* DENOTE *exactly as much as the Term divided.*
4. *No two of these Classes may be capable of being predicated of one and the same subject at the same time.*

Rule 1 distinguishes Logical Division from Physical.

Thus COLLEGE may be Logically divided into Naval, Military, Theological, &c.

a College, Physically, into Governing Body and Governed Body.

Rule 2 is so obvious that it is not easy to find a probable example of violation of it.

Rule 3 can always be complied with by dividing into such as connote the quality added, and such as do not.

(For instance, above, Plane Rectilineal Figure has been divided into Quadrilateral and non-Quadrilateral.)

Rule 4. The violation of this Rule is commonly called *Cross* Division.

I may, for instance, direct a Library to be divided, *i.e.* classified, according to the size, *or* the sub-

ject, *or* the language of each volume; but it could not be arranged on two of these principles taken together. What could be done with a folio copy of a Greek Philosopher?

So I may divide Plane Rectilineal Triangle—

1. According to the relations of the angles, OR
2. ..... the sides;

but an equilateral triangle must be also an acute-angled triangle.

Similarly, to divide Plane-Rectilineal-Quadrilateral-Figure into Trapezium, Parallelogram, Rectangle, and Square, would be faulty; because Parallelogram is GENUS when predicated of Rectangle and Square.

OF LOGICAL DEFINITION.

Every Logical Definition is

An Universal Affirmative Proposition in which Genus-and-Differentia is predicated of Species.

Thus—

"All Murder + Culpable Homicide with Malice."
"All Square + Rectangle Equilateral."

It is always Definition of a Term.

Thus—"Murder" having been adopted as a convenient name for "culpable killing with malice;"

"Parallelogram" as a convenient substitute for "Figure Plane Rectilineal Quadrilateral, having the opposite sides parallel;"

Any one with whom one is arguing may wish to have either of these Terms analysed.

If in place of either we had used the full description no Definition would have been required; unless one of the Terms substituted should have required it, and that would only be because such Term admitted of analysis.

Thus it becomes a serious question in a trial for Murder, "What is Malice?" and it is a question to answer which one must have particular knowledge of Legal Phraseology.

For the Law in certain cases assumes "Malice," (or at least it did some time back,)—

If A, at the time engaged in an unlawful act, slew B, the Law found "Malice" for him;

(but we must not travel into Law or Ethics.)

When the analysis of the Term is complete the Logical Definition is a self-evident truth; because, as we have already seen,

SPECIES, *connoting* the whole Essence = Part Common + Part Distinctive of that whole Essence.

No Logical Definition can stand good unless the Proposition conveying it can be converted into an Universal Proposition. For example:

"All Human + Animal Rational."
"All Animal Rational + Human."

But an Universal Proposition can be similarly converted if the Predicate be { DIFFERENTIA / PROPRIUM } of the Subject (SPECIES).

"All Animal + Sentient." (DIFFERENTIA.)
"All Sentient + Animal."

And

"All Human + capable of Articulate Speech."
(PROPRIUM.)

"All capable, &c. + Human."

This is why, on Page 8, we said that it was (not true in fact but) assumed that no Affirmative Proposition distributes its Predicate;

For it is from our knowledge extra-logical,

..... not ..... logical;

that we can ever convert A into A.

When required to define a Term, the Logician asks himself—

1. "What Idea does that Term (to my mind) *connote?*"
2. (If that Idea is complex),

"Which is the *common* / ..... *distinctive* } part of it?"

This being ascertained, he exchanges his Abstract Terms for the Concrete, and states his Proposition.

For example:

He has stated, "Every Parallelogram has certain properties."

He is required to define "Parallelogram."

The Idea *connoted* being complex, he ascertains that it may be analysed into

1. The *common quality* of being Plane Rectilineal Quadrilateral Figure.
2. The *distinctive quality* of having the opposite sides Parallel.

He replies therefore,

"Every Parallelogram + Plane Rectilineal Quadrilateral Figure, having the opposite sides parallel."

OF DEFINITION OTHER THAN LOGICAL.

By adding to DEFINITION the term *Logical* we of course imply that there is DEFINITION *non-Logical.* This is of three kinds—*Accidental, Physical, Nominal.*

OF ACCIDENTAL DEFINITION.

DEFINITION, etymologically, = "the laying down of boundaries."

Boundaries prevent the confusion of one object with another: they do not necessarily help us to ascertain the real nature of any.

If a child ask, "*What is Gun-Cotton?*" the answer "Cotton, which does as well as Gun-Powder" is sufficient: for the child would thus be enabled to distinguish between Gun-Cotton and any substance he had yet known by the name of Cotton.

Accidental DEFINITION = "*An Universal Affirmative Proposition, in which Accidens, Proprium, Differentia* (or any combination of these) is predicated of the Subject."

Again: it may be required to secure that some *individual Subject* shall not be mistaken for any other.

"*What is the Speaker of the House of Commons?*" is a question which must be answered by a *Logical* DEFINITION of the Office.

"*Which is the Speaker?*" asked by a Stranger present at the House, can only be answered by an *Accidental* DEFINITION.

"The Speaker is that gentleman in the long wig and the gown sitting under the canopy."

"*Which is the Chairman of Committees?*"

"He is that gentleman who sits by himself in that seat in the middle of the House."

OF PHYSICAL DEFINITION.

If an adult ask, "*What is Gun-Cotton?*" he will expect an accurate account of the mode of preparation and of the chemical qualities of Gun-Cotton.

"All Gun-Cotton is, &c. &c.

OF NOMINAL DEFINITION.

If I have to send to a Library for a book, I *may* define it *accidentally* (and to an "*illiterate*" messenger I should do so).

"The book I want is the third, or the biggest, on such a shelf."

To an intelligent messenger I should state the title, that is to say, I should give a *Nominal* DEFINITION.

It would not follow that the messenger, however intelligent, should have any idea of the contents of the book.

The book I want is "The Anatomy of Melancholy."
..... "Bright's Praxis."
..... "Carpenter's Physiology."
..... "Sugden on Powers."

If he could read I should get the book.

All Terms also admit of *Nominal* DEFINITION, and chiefly in three ways.

1. By simply substituting a word equivalent in meaning but better known, either generally or to the person requiring such Definition.

For instance,

(*a*) Mr. Verdant Green asked his mother to send him "two Ponies:" had she asked for a nominal Definition, she would not have sent the two Shetlands.

(*b*) "Many Birds this year?" a child might say, "Yes," if sparrows were abundant: a tenant-farmer or a country gentleman would know he was asked about partridges exclusively.

2. In many cases giving the Etymology of a word amounts to a *Nominal* Definition; for instance, *Astronomy—Geography — indurated — hypertrophous — synchronous — insoluble.*

In other cases this would be insufficient, or even misleading; for instance, *Geology—Telegraph—Desirable Premises.*

3. To supplement the two former methods we must often trace the history of a Term; for instance, *Whig—Tory—Puritan—Astrology—Pagan—Title* (for holy orders)—*Committee — Non-suit — Culprit — Automaton — Christian — Telegraph—Desirable Premises.*

APPENDIX.

REDUCTION.

On page 43 has been expressed an opinion that REDUCTION, except as an exercise, is useless. However, since, as an exercise, it is generally required of Students, it must not be omitted in a Manual designed for their use.

REDUCTION is of two kinds: OSTENSIVE (or direct), and AD IMPOSSIBILE (or indirect).

OSTENSIVE REDUCTION depends for its validity

1. On the fact that a PREMISS is equally assumed and granted whether it stand as MAJOR or as MINOR.
2. On the rules of CONVERSION.

ITS RULES are contained in the Memoria Technica given on page 29.

Observe, first, that only four INITIAL CONSONANTS are employed throughout, as in the first Figure, viz. B, C, D, F.

1. In any other Figure than the first these Consonants indicate *the mood of the first Figure to which the given Syllogism is to be* REDUCED.
2. The OTHER SIGNIFICANT CONSONANTS are *m* (for mutandæ), indicating that in the given Syllogism *the Premisses are to be transposed; s* and *p*, indicating that *the Propositions whose Symbols they immediately follow are to be converted.*

For example,

Suppose it be required to REDUCE Syllogisms in the moods
(1) CAmEstrEs, (2) DIsAmIs, (3) FELAptOn.

The moods of the first Figure will be
in (1) CElArEnt,
(2) DArII,
(3) FErIO;
in (1) and (2) the Premisses must be transposed.

Conversion must be applied
in (1) to the Minor Premiss, before transposition, and to the Conclusion.
(2) to the Major Premiss, before transposition, and to the Conclusion.
(3) the only thing required is to convert the Minor Premiss.

(1)

CAm	All morally-responsible	+	rational.
Estr	No Brute	—	rational.
Es	No Brute	—	morally-responsible.

to

CEl	No rational	—	Brute.
Ar	All morally-responsible	+	rational.
Ent	No morally-responsible	—	Brute.

(2)

DIs	Some	War	+	justifiable.
Am	All	War	+	calamitous.
Is	Some	calamitous	+	justifiable.

to

DAr	All	War	+	calamitous.
I	Some	justifiable	+	War.
I	Some	justifiable	+	calamitous.

(3)

FEl	No	idiots	—	morally-responsible.
Apt	All	idiots	+	human.
On	Some	human	—	morally-responsible.

to

FEr	No	idiots	—	morally-responsible.
I	Some	human	+	idiots.
O	Some	human	—	morally-responsible.

In order to get rid of REDUCTION indirect have been substituted in the Memoria Technica for BArOKO .... FAkOrO (1)
BOkArdO .... DOkAmO (2)

The *m* indicates as before.

The *k* indicates that the form of the Premiss whose symbol it immediately follows is to be changed, and the changed Premiss converted. For example:

A	All honest	+	expedient.	O	Some glittering	—	gold.
E	No not-honest	—	expedient.	I	Some glittering	+	not-gold.
E	No expedient	—	not-honest.	I	Some not-gold	+	glittering.

(1)

FAk	All honest	+	just.
Or	Some enforcement of strict legal right	—	just.
O	Some	—	honest.

to

FEr	No not-just	—	honest.
I	Some enforcement, &c.	+	not-just.
O	Some	—	honest.

(2)

DOk	Some Athletic exercises	—	beneficial to health.
Am	All	+	intended to be beneficial to health.
O	Some intended to be beneficial to health	—	beneficial to health.

to

DAr	All Athletic exercises	+ {intended to be beneficial to health.
I	Some not beneficial to health	+ Athletic exercises.
I	Some	+ {intended to be beneficial to health.

II. Reduction ad Impossibile (indirect) is applied to the Moods BArOkO and BOkArdO, the *k* here indicating that *in place of the Premiss whose symbol it immediately follows is to be assumed the Contradictory of the conclusion of the Syllogism to be reduced.*

It is best understood by an example.

BOK	Some studies	— useful.
Ard	All studies	+ intended to be useful.
O	Some intended to be useful	— useful.

to

b Ar	All intended to be useful	+ useful.
b Ar	All studies	+ intended to be useful.
A	All studies	+ useful.

But the new Conclusion is the Contradictory of the former Major Premiss, which is assumed to be true;

∴ the new Conclusion is false.

∴ {either the reasoning is faulty,
or a false Premiss has been assumed.

The reasoning is not faulty, (but correct in BArbArA;)

∴ a false Premiss has been assumed:

but not the Minor, which has been assumed to be true;

∴ the Major.

∴ the old Conclusion (its Contradictory) is true.

OF INDUCTION AND EXAMPLE.

ALDRICH included both under ABBREVIATED SYLLOGISM.

It is useful to exhibit each in CATEGORICAL SYLLOGISM, in order to show that, in each, the Syllogism which exhibits either breaks the law of Categorical Syllogism, or assumes a Premiss which is *literally* false, (though it may be *practically* true.)

INDUCTION.

"A. B. C. (specimens of Magnet) attract iron,
∴ All magnets attract iron."

This may be exhibited in two forms of Categorical Syllogism.

(1)

A	A. B. C.	+	attractive of iron.
A	A. B. C.	+	magnets.
A	All magnets	+	attractive of iron.

In this case the Minor Term, undistributed as Predicate of an affirmative Premiss is distributed as Subject of an Universal Conclusion; i.e. there is *illicit process of the* MINOR TERM.

(2)

bAr	A. B. C.	+	attractive of iron.
bAr	All magnets	+	A. B. C.
A	∴	+	attractive of iron.

In this case the Minor Premiss is *literally* false: it assumes that which it is the (distinct) office of Inductive Reasoning to prove, viz. that the specimens are adequate representatives of the whole class called by the name "Magnet."

Example.

EXAMPLE is either identical with Induction (in form), or a Deductive Categorical Syllogism whose Major Premiss is supplied by Induction.

(I take again ALDRICH's instance).

"Cæsar and Pompey will tear the Country to pieces, for so did Sylla and Marius."

bAr	Sylla and Marius	+	tearers of the Country to pieces.
bAr	Cæsar and Pompey	+	Sylla and Marius, (*literally* false.)
A	Cæsar and Pompey	+	tearers of the Country to pieces.

(*or*)

bAr	All of the character of Sylla and Marius	+	tearers of the Country to pieces.
bAr	Cæsar and Pompey	+	of the character of Sylla and Marius.
A	Cæsar and Pompey	+	tearers of the Country to pieces.

The real difference between Induction and Example is in the matter with which they deal.

It is impossible to establish Uniformity of Law in respect to human conduct.

It is asserted to be possible in respect to physical facts.

Hence the sphere of Induction is Science, and its office is to convince.

The sphere of Example is Contingent matter, and its office is to persuade.

I subjoin a recent instance of reasoning by Example.

It has been said, that "the further Russia pushes her Empire towards India the weaker she must become"; and we are referred by way of Example to the Crimean War, the result of which is supposed to have established that "the farther from the base of operations Military operations are carried, the more exhausting they are." Admit this as proved by the Example quoted, and the conclusion logically follows.

THE END.

TABLE OF CONTENTS

CHAPTER		PAGES
	Terms, Relations, Propositions	
I.	Introduction to inference ..... Preliminary definition of the science. Logic and the sciences. Inference and its signs. The case of false premises. Notation for classes. Truth-values independent of the terms. The properties of a relationship. Meaning of definition. Exercises.	1–17
II.	Classification of terms ..... The predicables. Reduction of terms to the concrete general. Universe of discourse. Exercises.	18–26
III.	Logical and grammatical forms..... Propositions recognized by grammarian. Forms recognized by the logician. The double meaning of disjunction. Law connecting conjunction and disjunction. Law connecting disjunction and implication. The categorical forms and their diagrammatical representation. Exercises.	27–39
	Fallacies	
IV.	Historical changes in meaning..... The problem of semasiology. Law of generalization. Law of specialization. Transfer of meaning by analogy. Exercises.	43–51
V.	Semi-logical and material fallacies..... Sophism, paradox and paralogism. Extension of the meaning of terms or relationships. Equivocation and amphibology. Fallacy of accent. Fallacy of many questions. Fallacy of accident. Conscious ambiguities. Ignoratio elenchi. Ambiguities of common words. Petitio principii. Achilles and the tortoise. Exercises.	52–74
	Immediate Inference	
VI.	The universe of the categorical forms..... Meaning of the true and untrue. The propositional universe. Contradictories, contraries, subcontraries and subalterns. Exercises.	77–84

CONTENTS

CHAPTER — PAGES

VII. The moods of immediate inference 85–96
Figures of immediate inference. Array of immediate inference. Validity and invalidity of Euler's diagrams. Deduction of the valid moods. Deduction of the invalid moods. Exercises.

VIII. The rules of immediate inference 97–103
Distributed terms. Affirmative forms and negative forms. Corollary to the rules. Exercises.

SYLLOGISM

IX. The moods and figures of the syllogism 107–124
Illustrative examples. Rules for constructing the diagrams. Invalidity determined by diagram. Determination of figure. Other diagrammatic methods. Parts of the syllogism. Array of the syllogism. The mnemonic lines. Reductio ad impossibile. Indirect reduction by other processes. Exercises.

X. Deduction of the syllogistic moods 125–134
Examples of deduction. Rules of contradiction and interchange. Rules of simple conversion. Deduction of the invalid moods. Rules of the syllogism. Exercises.

XI. The hypothetical syllogism 135–147
Conditional arguments. Dilemma of the crocodile. Constructive hypothetical syllogism. Paradox of Tristram Shandy. Fallacy of affirming the consequent. Destructive hypothetical syllogism. Fallacy of denial of the antecedent. Complex hypothetical syllogism. Exercises.

XII. The dilemma 148–157
The paradox of Gorgias. The paradox of Corax and Tisias. Complex constructive dilemma. Complex destructive dilemma. Proof of the dilemmatic argument. Exercises.

XIII. The sorites 158–163
Construction of the valid moods. The inverse operation. Rules of the sorites. Exercises.

XIV. The verification of the classical system 164–172
Supposed breakdown of the system. Reason for this misapprehension. Solution of the difficulty. Reconciliation with common sense. Effect on contraposition and on obversion.

PREFACE

The recent developments in logical theory following upon the contributions of Boole, Pierce, and Schröder have seemed to place the subject beyond the reach of the average student and even in most instances beyond the reach of the technically equipped philosopher. The result has been to reduce the attention that was formerly given to elementary instruction in logic and to displace the traditional course from its originally dominant position in the university curriculum. The conviction is abroad that the ancient *organon* is so far inferior to the modern instrument perfected by the critical labors of Peano, Frege, Russell, and others, that it no longer deserves the attention once bestowed upon it. These objections the writer has endeavored to meet, in the first instance by introducing no symbols whatever, save the ones employed by traditional logic itself, so that the treatment may be followed by any intelligent reader, and secondly by keeping modern developments always in mind while following the traditional order of treatment. Finally, he has met the recent contention that the classical system does not hold true in all of its parts, by showing in the last chapter of this work that

this view is based upon a misapprehension. In completing the chapters dealing with the theoretical portion of the subject the writer has availed himself of parts of his *Letters on Logic,* which in turn is based upon a brief syllabus which Professor Singer once placed at his disposal, and also of parts of his recently published *Foundations of Formal Logic.*

TERMS, RELATIONS, PROPOSITIONS

UNIV. OF CALIFORNIA

CHAPTER I

INTRODUCTION TO INFERENCE

Every deductive science is concerned with a set of **relationships** which are peculiar to its domain or field of application, and a set of **objects** of which it is meaningful to say that they stand in these relationships to one another. Suppose a set of objects, *a, b, c,* etc., which stand for classes or groups of things, and the relation of **inclusion,** and consider the statement,

a is included in *b*.

If *a* stands for *Athenians* and *b* stands for *Greeks,* it is clear that the members of the *a* class are contained among the members of the *b* class and the statement that *a* is included in *b* is true. But if the case should be reversed and we should say,

b is included in *a,*

then it would be untrue, for not all Greeks are Athenians. Any statement that is either true or false is *meaningful; meaningless* if it be neither true nor false.

UNIV. OF CALIFORNIA

CHAPTER I

INTRODUCTION TO INFERENCE

Every deductive science is concerned with a set of **relationships** which are peculiar to its domain or field of application, and a set of **objects** of which it is meaningful to say that they stand in these relationships to one another. Suppose a set of objects, *a, b, c,* etc., which stand for classes or groups of things, and the relation of **inclusion,** and consider the statement,

a is included in *b*.

If *a* stands for *Athenians* and *b* stands for *Greeks,* it is clear that the members of the *a* class are contained among the members of the *b* class and the statement that *a* is included in *b* is true. But if the case should be reversed and we should say,

b is included in *a,*

then it would be untrue, for not all Greeks are Athenians. Any statement that is either true or false is *meaningful; meaningless* if it be neither true nor false.

Suppose a set of objects, x, y, z, etc., and the relation of **implication,** and consider the statement,

x implies y.

Substitute here for x the expression, Socrates is a man, and for y the expression, Socrates is a mortal, and we have,

Socrates is a man implies
Socrates is a mortal,

the result, whether true or false, being at least meaningful. If we were to say, Socrates implies Greeks, we would say something that is neither true nor false. The expression would be meaningless because only of propositions (not of classes) can we say that the one *implies* the other.

Since the meaning of the objects and relationships with which a science deals will only appear when the science has been developed, it will not be possible to give an exact definition of the science with which we shall be concerned; but we may say that *logic* deals with propositions and with *inferences,* with classes and their *inclusion,* total or partial, with respect to one another.

PRELIMINARY DEFINITION OF THE SCIENCE

The most important matter with which logic is concerned is the matter of **inference.** Every man

reasons, and oftentimes, correctly enough, before he possesses any science of inference. It is the purpose of these chapters to enable the student to become aware of the *processes* which he employs habitually in his thinking; to enable him to distinguish, in as many cases as possible, a good argument from one that is fallacious; to enable him to argue with some consciousness of the misapprehensions that lead men to adopt erroneous opinions. *Inference* being, then, the most important matter with which the logician has to deal, we shall content ourselves with the following *preliminary* definition: *Logic is the science of inference necessary and probable.* Necessary inference corresponds broadly to what is called **deductive** logic, whereas probable inference is treated in another department of the subject, which is known as **inductive** logic. It is only with the science of necessary inference that the present work undertakes to deal.

LOGIC AND THE SCIENCES

Upon reflection the student will at once become aware that in all the sciences the drawing of inferences is customary and habitual, and we may adduce this fact as an additional reason for making a study of inference at first hand. Jevons remarks: "One name which has been given to Logic, namely

the Science of Sciences, very aptly describes the all-extensive power of logical principles. The cultivators of special branches of knowledge appear to have been fully aware of the allegiance they owe to the highest of the sciences, for they have usually given names implying this allegiance. The very name of logic occurs as part of nearly all the names recently adopted for the sciences, which are often vulgarly called the 'ologies,' but are really the 'logics,' the 'o' being only a connecting vowel or part of the previous word. Thus geology is logic applied to explain the formation of the earth's crust; biology is logic applied to the phenomena of life; psychology is logic applied to the nature of the mind. . . . Each science is thus distinctly confessed to be a special logic. The name of logic itself is derived from the common Greek word λόγος, which usually means *word,* or the sign and outward manifestation of any inward thought. But the same word was also used to denote the inward thought or reasoning of which words are the expression, and it is thus, probably, that later Greek writers on reasoning were led to call their science ἐπιστήμη λογική, or logical science; also τέχνη λογική, or logical art. The adjective λογική, being used alone, soon came to be the name of the science, just as Mathematic, Rhetoric, and other names ending in 'ic' were originally adjectives, but have been converted into substantives."

INTRODUCTION TO INFERENCE

INFERENCE AND ITS SIGNS

Whenever an inference is intended, we are usually made aware of the fact by the occurrence of some typical word: *hence; therefore; accordingly; if, then; implies; whence; it follows.* Thus:

> "If a strict definition of logic were stated at the outset, the student would not comprehend its intention,"

is an inference, by which it is intended to assert that the second part of the statement *follows* from the first. Or, again:

> "The definition of logic just given is exact. Hence the student must not expect to comprehend its full meaning at once."

But the presence of such words as these does not infallibly suggest that the first proposition *implies* the second. Suppose the case:

> "*If* there be any virtue, think on these things."—*Phil.* iv: 8.

This is in the form of an admonition or command, and, since it cannot be said to be either true or false, it is not properly a proposition at all.

It is important, in order to gain precise notions of the meaning of inference, to become aware that a proposition quite false in itself, may yet be truly implied by another. Thus it is untrue that Cæsar is an Athenian and untrue that Cæsar is a Greek, and yet the first proposition *implies* the second:

> If Cæsar is an Athenian,
> then Cæsar is a Greek.

The omission of the statement, "All the Athenians are Greeks," which is understood, if not expressed, a procedure common in ordinary speech, is called **enthymeme.** By this term we intend to signify that our speech is silent on a matter that is tacitly understood.

THE CASE OF FALSE PREMISES

Moreover, it is to be remarked that one or more assertions, untrue in themselves, may yet imply a proposition that is true. If we were to argue:

> Alexander is one of the heroes of the Iliad and all of these heroes died young; therefore, Alexander died in his youth,

our premises, or initial statements, would be false, although our conclusion would be true and the

argument would be formally correct. The fact to be observed in this connection is this: that the conclusion of an argument can only be asserted when the premises are true and the implication formally valid, *except* (as in the case above) when the conclusion is true in independence of the argument. We should then say (that is, in the case last contemplated) that the truth of the conclusion is based on *extralogical* information, that it is true in point of fact and not *because* of the premises.

We may, in this connection, call attention to an error into which uninstructed common sense sometimes falls, through a failure to recognize this distinction. A speaker, we will say, is trying to convince us of the wisdom of some political policy, or, it may be, the truth of some political theory. He begins with premises that we are altogether disinclined to allow; but, as the result of a series of cogent inferences, we find him, toward the end of his discourse, asserting matters that all of us agree to be so. Unconsciously, as we retrace his argument and discover each one of his steps to be validly taken and the outcome of his original statements to be true—unconsciously, I say, we are apt to conclude that there must be some truth in the premises with which he began. But such a conclusion would be in no way justified. The error involved in such a step is known as the fallacy of **asserting the consequent.**

NOTATION FOR CLASSES

We shall, in the chapters which follow, employ the small letters at the beginning of the alphabet, *a, b, c,* etc., to designate groups—Athenians, Greeks, Triangles, etc.—groups the members of which are ordinarily conceived by the aid of some quality or characteristic which they have in common. We shall thus learn to habituate ourselves to such expressions as,

All of the *a's* are *b's*

or, as we shall phrase it more commonly,

All *a* is *b,*

and by this we shall understand it to be asserted that all the members that belong to the *a* class are contained among the members of the *b* class. If *a* and *b* be particularized, so that the assertion becomes,

All metals are elements,

it will be true; whereas, if it were to read,

All metals are compounds,

it will manifestly be untrue.

In the light of this illustration it will be clear that the truth or untruth of assertions similar to this, like,

All *a* is *b*,
some *a* is *b*,
no *a* is *b*,
some *a* is not *b*,

will depend upon what specific meaning is assigned to the symbols *a* and *b*.

TRUTH-VALUES INDEPENDENT OF THE TERMS

But the student will have to habituate himself as well to expressions whose truth or untruth is *independent* of the meaning of *a* or *b*. Suppose that in the first and third expressions listed above, *b* should take on the specific meaning non-*a*, we should then have,

All *a* is non-*a*,
no *a* is non-*a*,

which would become, if we were further to particularize the meaning of *a*,

All Athenians are non-Athenians,
no Athenian is a non-Athenian.

It would be evident that the last of these expressions will be true for all possible values of *a* and

that the first will be untrue in the same way, without any restriction being placed on the meaning of *a*.

Similarly, the first member of our original set implies the second, that is,

If all *a* is *b*,
then some *a* is *b*,

quite in independence of what substantives may be substituted for these symbols. Thus,

If all squares are circles,
then some squares are circles,

and the implication holds even when *a* and *b* stand for **empty classes**—that is, for classes which contain no objects at all, for,

If all square-circles are squares,
then some square-circles are squares.

Another implication of a somewhat more general character than the cases that have just been cited, and whose truth is independent of the meaning of *a*, *b*, and *c*, would be,

If some *b* is not *a*
and all *b* is *c*,
then some *c* is not *a*.

A case of this sort may occasion the student some difficulty when he meets it for the first time, but by continued attention to its sense he will soon be able to assure himself of its general truth. Particularized, it might read:

> If some scholars are not Englishmen
> and all scholars are cultivated,
> then some who are cultivated are not Englishmen.

By these examples we have sought to provide the student with a *preliminary* conception of the abstract nature of inference. To broaden and deepen this conception is a part of the task of the chapters which follow.

THE PROPERTIES OF A RELATIONSHIP

Relationships as well as their objects possess properties, and, since it is often important for the student of pure science to have these in mind, we shall enumerate those that are most characteristic. Incidentally, we shall illustrate further some of the distinctions already set down.

Corresponding to any relationship there will be a set of objects, of which it is meaningful to say that they stand in this relationship to one another. Such a set will be termed a **system.** A relation is said to be **reflexive** when it holds of any one of its

objects and that object itself. Thus, *implication* is reflexive, for,

If x (is true) then x (is true);

and so is *inclusion,* for,

(What is) a is included in (what is) a

and the same holds of numerical equality.

(The number) p equals (the number) p.

But *less than* is not reflexive:

(The number) p is less than p;

nor is *perpendicularity* reflexive, at least in the ordinary geometry:

(The line) m is perpendicular to m.

A relation is said to be **reciprocal** or **symmetrical** when, if it holds of any two of its objects, x and y, it holds also of y and x. Thus, *parallelism* and *perpendicularity* are symmetrical:

If x is parallel to y,
then y is parallel to x;
if x is perpendicular to y,
then y is perpendicular to x.

But, of events in time, *subsequent to* is not symmetrical:

If p is subsequent to q,
then q is subsequent to p;

nor is *to the right of* symmetrical:

If a is to the right of b,
then b is to the right of a.

A relation is said to be **transitive** if, when it holds of x and y and of y and z (three of its objects), it holds also of x and z. Accordingly, *implication* and *inclusion* are transitive, but *is the father of* is not transitive. Consider the assertion:

If p follows q and q follows r, then p follows r, p, q, and r being regarded as three events in time. Obviously, the statement will be verified if the events occur in the order,

$$r\ q\ p.$$

But suppose that they *actually* occur in the order,

$$p\ q\ r.$$

Then all of the *parts* of the original assertion, viz., p follows q, q follows r, and p follows r, are false. It is very important for the student to realize that the assertion *as a whole,* in spite of this fact, holds

true. The first two parts taken together form what is called the **antecedent** of the implication, and the last part is called its **consequent.** It may be remarked in general, that whenever one of the parts of the antecedent becomes false, or whenever the consequent becomes true, then the consequent *follows* in the particular case, whether it follows generally or not. There are six permutations of the three letters *p, q,* and *r.* The student will find it a valuable exercise to verify the *transitivity* of the relation *follow* (in point of time) by taking its objects in each one of their six possible orders.

MEANING OF DEFINITION

We have now made clear what it means for a relationship to possess or not to possess a given property. We remark, further, that it is by its properties that it is defined. Suppose three relationships are given and it is said of the first that it is symmetrical, but neither reflexive nor transitive; of the second that it is transitive, but neither reflexive or symmetrical; and of the third that it is reflexive and transitive, but not symmetrical.

Now, while you cannot say of the first relation precisely what it is—it might be the relation of *spouse* or the relation of *perpendicularity*—you may yet name a good many relations which it is not. For example, it is not *father of,* or *subsequent to,* or *to the right of.* But (and this is the important

thing) its possible meaning is delimited by the conditions imposed upon it. The second might be the relation *greater than* or it might be *subsequent to.* The third might be *implication* or it might be *inclusion.* In each case there will be a great many things which it could not be.

Our meaning will now be clear when we say that a relationship is defined when enough of its properties have been enumerated to distinguish it from whatever other relationships are in question, and that these properties are to be found by constructing all the true and all the false propositions into which this relationship may enter in a meaningful way. The task of any deductive science, then, is to completely develop its own system, for it is precisely within its own system that the propositions in question may be found. A deductive science, therefore, is defined by the task or problem which it sets for itself, and its *full* meaning, accordingly, will only appear when this task has reached completion.

EXERCISES

1. Are the following consequences justly drawn from the stated conditions:

   Upon experiment it is found that a musical note p and a musical note q cannot be distinguished by ear, and that the same holds of q and r. It is inferred that p and r are indistinguishable by ear.

   Two straight lines have no common perpendicular. It is inferred that they approach each other.

A candle is burned in air under a jar, until the oxygen is exhausted. It is inferred that the inert residuum ("nitrogen") is one chemical substance.

A chair and a lead ball of equal weight are held, one in each hand. It is inferred that they will be judged of equal weight.

The pitch of an engine whistle is rising. We infer that the train is approaching.

An ice vender has two weightless scales. He hangs one scale on the other and ten pounds of ice on the lower scale. We infer that each scale will register five pounds.

The number of prime numbers is less than the number of numbers, for not every number is prime.

A thick glass and a thin glass are filled with boiling water by different observers in different rooms. The observer with the thin glass infers that the glass in the other room did not break because his own did not.

2. Examine the following statements in order to determine their truth or untruth:

War is war and Germany is Germany.

"No man can lose what he never had."

A work of art is either moral or immoral.

"Hang sorrow! Care will kill a cat,
And therefore let's be merry."

"O wad some power the giftie gie us
To see oursels as ithers see us!"

It is true that not all prime numbers are odd.

If no proposition is true, then one proposition is true.

If the moon is green cheese, Cæsar and Socrates are the same person.

3. In the following propositions:

All metals are elements,
no elements are compounds,
some metals are red,
not all metals are white,

the relations are: "all, are," "no, are," "some, are," "not all, are." Classify these under the heads, reflexive, symmetrical, and transitive.

CHAPTER II

CLASSIFICATION OF TERMS

The word **term** is from the Latin *terminus* and is so designated because it forms one end of a proposition. For our purposes a term is synonymous with a **class,** a group of objects which have some characteristic in common, every substantive in the language being the symbol for such a group. If a term denotes a perfectly definite group of objects, it is called a **constant** term; if it stands indifferently for any class whatever, it is called **variable.**

THE PREDICABLES

Many are the ways in which terms may be classified, but only those divisions will be noticed which have some bearing on our subsequent theory and its applications. In the first instance, because of the importance of the terminology, we must describe the Aristotelian **predicables.** These are said to be the kinds of terms or attributes which may be predicated of any subject. They are called genus, species, difference, property, and accident. When a class is conceived as divided into a number of smaller classes it is called the **genus,** and each

smaller class that goes to make it up is called a **species** of the genus. Thus, if the genus be the class of numbers, odd numbers and even numbers are two species of the genus; if the genus be odd numbers, all prime numbers, except the number two, will be one of its species. It is important to observe that, while the genus contains more objects or individuals than the species, it is defined by fewer attributes. If the genus be number and the species be prime number, the genus is defined by whatever is characteristic of number, and the species by these same attributes with the addition of whatever is characteristic of a prime.

This double meaning of genus and species is fixed by different names. Thus, the individual things to which the term applies, comprise its meaning in **extension** (extent, breadth, or denotation). The qualities that serve to define the term comprise its meaning in **intension** (intent, depth, or connotation). Ordinarily, if we add qualities to a term—that is, if we increase its meaning in connotation or intension—we thereby diminish its meaning in denotation or extension. Two species of the genus substances would be elements and compounds, the first being gotten by adding the quality "chemically simple," or "not further reducible," to the genus. Again, two species of the genus element would be metals and non-metals. The first would be gotten by adding, it may be,

the characteristics, possessing luster and being an easy conductor of electricity. It is, therefore, usually said: As the connotation of a term is increased the denotation is decreased. The student must be warned, however, that this law only holds when the extension of the genus class is finite. Thus, if there be an infinite number of prime numbers, the denotation of "number" is not diminished by adding that the number is a "prime number."

The additional qualities required to distinguish the species from the genus are called the **difference,** and a class is supposed to be defined by the proximate genus (next higher genus) and the difference. The old manuals of logic, following tradition, speak often of a lowest species (*infima species*), a class not further divisible, and a highest genus (*summum genus, genus generalissimum*), which cannot in turn be taken as the species of a higher class. The modern counterparts of these are the **null class,** or class which contains no objects, such as square-circles or alien Americans, and the so-called **universe** of discourse, which contains all the objects that happen to be in question.

The remaining predicables, property and accident, are thus defined: A **property** is any quality that may be predicated of a class, and which, implicitly or explicitly, is essential to the meaning of the class. An **accident** is any quality which may be predicated of a class, but which is not essential

to the meaning of the class. It would be accidental for an isopod to be red, but essentially it must have equal legs. An odd number has the property of being not divisible by two; it is accidental to its meaning for it to be a prime. Water is essentially composed of hydrogen and oxygen and only by way of accident is it a solid, a liquid, or a gas.

REDUCTION OF TERMS TO THE CONCRETE GENERAL

Terms are, according to another important distinction, either singular or general. A **singular** term denotes an individual. Such names as London, Socrates, the Vatican, or the son of Napoleon I, Kant, or either one of the Kilkenny cats, designate a single object. A **general** term denotes any one of a number of objects. Cabbages and kings, monkeys and prime ministers would be examples of the case in question. In the logic of Peano, whose work has inspired much of the recent research in this subject, the relation of an individual to a class is conceived as different from the relation of a class to a class. What distinguishes the case of the inclusion of one class in another and the case of the inclusion of an individual in a class, is the property of transivity, which is taken to hold of the first relation, but not of the second. If I say, "Athenians are men and men are a class, therefore Athenians are a class," I say something that is not only meaningful, but true. But if I assert, "Soc-

rates is a man and men are a class, therefore Socrates is a class," I am supposed to say something meaningless, or at least something untrue, the conclusion being false and the premises being true.

We shall, however, in our subsequent theory reject this distinction of Peano's making, as one whose nature is extralogical, as one which turns on a question of fact or is a matter of application. That is, we shall say, "Socrates is a man" is exactly expressed by the phrase, "Every Socrates is a man," it being a matter of extralogical information—that is, a matter of fact—that there is only one Socrates. Or, to take a case in which a singular term occurs both as subject and as predicate, the proposition, "St. Paul's is the largest cathedral," is exactly, if awkwardly, expressed by, "Every St. Paul's is every largest cathedral," for it is a geographical fact that there is only one St. Paul's, and it is an arithmetical fact that there is only one largest member of a class. Accordingly, in translating grammatical expressions into the forms which are recognized by the logician, a singular term may always be reduced to a term which is general.

A further division of terms, which it is necessary to recognize, is the distinction between those which are abstract and those which are concrete. All general terms are either concrete or abstract. A **concrete** term is the name of a group of things conceived as individuals. An **abstract** term is the name

of a group of things conceived by the aid of a common property. It will not be necessary to multiply illustrations of this distinction. Truth and beauty are abstract terms; true things and beautiful things are concrete. If I say "Truth is beauty," the same meaning is advanced in the expression, "True things are beautiful things." Observe, then, that just as the singular term may always be reduced to the concrete general, so terms that are abstract may always be made concrete.

In concluding a classification of terms we must notice their division into those that are positive and those that are negative. All general terms are either positive or negative. A **positive** term connotes the possession of a quality. A **negative** term connotes the absence of a quality. The genus substances is made up of two species, elements and non-elements, and of these the first is positive and the second negative. But this distinction is relative, for elements and non-elements may be called, respectively, non-compounds and compounds. Whenever a negative term describes some class important in itself, language has generally invented a positive term to correspond. For the chemist non-elements are as important as elements, so that the word compounds has been invented to stand for that class. There are, however, notable failures to create such a word. The genus elements is divided into metals and non-metals, but there is no corresponding positive term

with which to designate this latter class. In general we observe that is an accident of language, whether or not a negative term possesses a synonyme which expresses its positive sense. Not all terms which have a negative prefix, however, convey a negative intent. Jevons remarks: "The participle *unloosed* certainly appears to be the negative of *loosed;* but the two words mean exactly the same thing, the prefix *un-* not being really the negative; *invaluable,* again, means not what is devoid of value, but what cannot be measured; and a *shameless* action can equally be called by the positive term, a *shameful* action."

UNIVERSE OF DISCOURSE

It is necessary to have very clearly in mind the distinction between a positive term and its corresponding negative, or the distinction between a class and its contrary (contradictory), if we are to understand the meaning of what is called the **universe of discourse,** a conception which now plays a very important rôle in the present-day logical theory. The view that in any argument there is presupposed a limited class, which stands for all of the objects under discussion, is due to De Morgan and we can not do better than to quote this author in full: "Let us take a pair of contrary names, as man and not-man. It is plain that between them they represent everything imaginable or real, in the universe. But

the contraries of common language usually embrace, not the whole universe, but some one general idea. Thus, of men, Briton and alien are contraries: every man must be one of the two; no man can be both. Not-Briton and alien are identical names, and so are not-alien and Briton. The same may be said of integer and fractions among numbers, peer and commoner among subjects of the realm, male and female among animals, and so on. In order to express this, let us say that the whole idea under consideration is the *universe* (meaning merely the whole of which we are considering parts) and let names which have nothing in common, but which between them contain the whole idea under consideration, be called contraries *in or with respect to that universe.* Thus, the universe being mankind, Briton and alien are contraries, as are soldier and civilian, male and female, etc.: the universe being animal, man and brute are contraries, etc."

EXERCISES

1. Give a connotative and give a denotative definition of prime numbers less than ten.
2. Name three species of the following genera, which together make up the whole: animal, plant, number, element.
3. Show how the law which connects the quantity of extension with the quantity of intension holds of the series: gold, metal, element, substance.
4. Are the following characteristics, that are predicated of the planets of our system, properties or accidents?
   There is a "regular progression of distances" of the planets from the sun (expressed as Bode's law). This breaks down at Neptune.

The plane of a planet's rotation practically coincides with that of the orbit of each—probably excepting Uranus.
The direction of rotation is the same as that of the orbital revolution—probably excepting Uranus and Neptune.

5. Does the term property, as used in the statement which follows, conform to the definition of this chapter?
The properties of the elements are periodic functions of the atomic weights;—elements arranged in a series of increasing atomic weights show steady increase or steady decrease in a property within any one period. Exceptions are iodine, tellurium, iron, cobalt, and nickel.
6. What universe of discourse is most naturally suggested by the following terms and their negatives? Odd numbers, straight lines, carbon compounds, protective tariffs, foreign policies.
7. Define the following words in terms of what you take to be the proximate genus and the difference: triangle, mammal, proposition, system, species.
8. Can the following words be termed *indefinables* in the above sense? Class, point, number, time, length.
9. Classify the following words under the heads, singular and general, abstract and concrete, positive and negative: unwieldy, Jupiter, protoplasm, Senate, incognito, respiration.

CHAPTER III

LOGICAL AND GRAMMATICAL FORMS

At the conclusion of our introductory chapter we were at pains to distinguish between statements whose truth or falsity depends upon the meaning of the terms, and those whose truth or untruth is independent of any meaning that our general terms, *a, b, c,* etc., may happen to take on. Statements of the first sort are commonly designated **propositional functions;** those of the second sort, **propositions.** In spite of this distinction we shall employ the word *proposition* to denote any sentence that is either true or false, and the word will now be understood to be defined in this more general sense.

Not all the sentences which the grammarian recognizes are propositions. Thus, the **interrogative,** the **hortatory,** and the **imperative** modes of expression will be sentences, but not propositions in the sense defined. It is neither true nor false to say,

> "What's Hecuba to him or he to Hecuba,
> That he should weep for her?"

Or to say,

> "Eat, drink and be merry."

Or, again,

"Stand not upon the order of your going,
But go at once."

Of any sentence, however, which the grammarian calls **declarative, optative,** or **exclamatory,** either truth or falsehood may be predicated. It is our purpose here to indicate the manner in which any proposition, of whatever grammatical form, may be expressed by means of the few simple forms which the logician recognizes. It is manifest, then, that our analysis need not concern itself with sentences of the interrogative, the hortatory, or the imperative type.

In the first place, we observe that any expression in the optative form may always be made declarative. If one were to say,

"Would that ignorance were bliss,"

he might, presumably, substitute for this, without changing the meaning in any way,

"I wish that ignorance were bliss."

Or, again,

"The devil damn thee black,
Thou cream-faced loon,"

is clearly susceptible to the same modification, it may be at the cost of some rhetorical advantage.

A reduction of the exclamatory to the declarative form is equally possible. Thus,

"A Daniel come to judgment!"

means, we may presume,

"Another Daniel's come to judgment,"

Or, again, the exclamation,

"How sharper than a serpent's tooth it is
To have a thankless child!"

may easily be made direct assertion. We may, therefore, confine our attention to declarative sentences alone.

In effecting a further reduction of grammatical forms, in order to show that the forms employed by the logician are sufficient for the expression of any truth, we observe that any verb other than the verb "to be" may be rendered by the copula, by absorbing its meaning into the predicate term. The expression "it rains" has always reference to some particular place as,

"It is raining in London,"

and this in turn is equivalent to

"London is a place where rain is falling."

If it be remarked that,

"A favorite has no friend,"

the same intention is expressed by,

"Every favorite is friendless."

The distinction of *number* offers, in turn, no real difficulty. The proposition,

"All the Athenians are Greeks,"

may be written in the equivalent form,

"Every Athenian is a Greek."

Moreover, the word "all" need not be replaced by "every," for we may say, at the cost of some awkwardness:

> "All the members of the class Athenians is a member of the class Greeks."

Further, differences of *tense* are easily reduced to the *present* by attaching a date, or the suggestion of a date, to the predicate term. Thus, in place of,

> "Achilles was celebrated as the swift of foot," it may be stated that,
>
> "Achilles is celebrated in the 'Iliad' as the swift of foot."

The student will have no difficulty in effecting a reduction of other grammatical distinctions, such as those of *person, voice,* and *mood.* Assuming, then, that these reductions have been made, it will be taken for granted that any proposition, of whatever grammatical structure, may be cast into one or more of the relational functions that belong to the domain of which logic treats.

LOGICAL AND GRAMMATICAL FORMS

FORMS RECOGNIZED BY THE LOGICIAN

The logician recognizes the following propositions as necessary and sufficient for the expression of any truth:

(1) The **disjunctive** form (either, or),
either x or y,

(2) The **conjunctive** form (and),
x and y,

(3) The **hypothetical** form (if, then),
x implies y,

(4) The **categorical** forms (adjective of quantity copula),

A (ab)	All a is b,
E (ab)	No a is b,
I (ab)	Some a is b,
O (ab)	Some a is not b.

THE DOUBLE MEANING OF DISJUNCTION

The disjunction, *either, or,* in ordinary speech is ambiguous. If we were to say of such and such a person,

> "This man is either an Englishman or a Shakespearean scholar,"

we may not intend to exclude the possibility of his being both, educated Englishmen being supposed, we will say, to know the plays well, while the same assumption is not made of men of other nationalities. But if we were to say,

> "I know that I shall either like this man or dislike him very much,"

the intention is clearly to exclude the possibility of my liking him for some of his qualities and disliking him for others.

Here, however, the disjunction is not one between classes, as in our first illustration, but one between propositions, as in our second example. Commonly, when the options of every-day life are expressed in the form of a disjunction, when they are what William James calls options of the living, forced or momentous kind, we intend the sense: either the one or the other, *but not both.* Thus to transform some of James's illustrations,

> "This man is either Christian or he is agnostic," or
> "You must either accept this truth or go without it,"

the two parts of the disjunction *cannot both be true.*

If, on the other hand, I should meet a man whose knowledge of Shakespeare is extraordinary and should exclaim in surprise,

> "Either this man is an Englishman or else he is a Shakespearean specialist,"

I mean at least *one* of the parts of the disjunction to be true, and *possibly both.* The student should always bear in mind that this last case conveys the

true meaning of *logical* disjunction and that disjunction will always be understood in this sense.

Whenever the letters x, y, etc., are used to designate propositions, they are commonly taken to be true; that is, the words, *is true,* are understood to follow each one. Thus, if we assert,

either x or y,

we are only shortening the expression,

either x is true or y is true, or both,

and the shorter phrase,

x and y

means in expanded form,

x is true and y is true.

Whenever the proposition x or the proposition y is taken to be false ,the words, *is untrue,* will have to be expressly written down.

LAW CONNECTING CONJUNCTION AND DISJUNCTION

It will always be possible to express the denial of a disjunction—that is, the assertion that the whole statement, either x or y, is untrue, in the form of a conjunction of the two propositions involved. Thus, the untruth of

either x is true or y is true

is exactly rendered by

x is untrue and y is untrue.

This is an important fact and is one of the reasons for taking logical disjunction in the sense above defined. If we deny of some person "that he is either foreign born or that he is foreign bred," we assert the same thing when we say:

> "That he is foreign born is untrue and it is untrue that he is foreign bred."

In the same way the denial of the conjunction of two propositions may always be expressed as a logical disjunction. Thus the untruth of

x is true and y is true

is precisely equivalent to

either x is untrue or y is untrue.

If we deny "that this student is dull and that he needs no stimulus," we express the same thing by saying,

> Either this student is not dull or else he needs a stimulus.

This law which connects the conjunctive and the disjunctive forms may be expressed generally as follows: the denial of the disjunction of two propositions is the conjunction of the two separately

denied; the denial of the conjunction of two propositions is the disjunction of the two separately denied.

LAW CONNECTING DISJUNCTION AND IMPLICATION

There is another fact, which is universally assumed in modern logical investigations and to which it is right to direct the student's attention. This is a certain equivalence, which is assumed to exist between the hypothetical and the disjunctive forms. The assertions,

> "If he speaks not in jest, then
> he speaks in earnest," and
> "Either he speaks in jest or in earnest,"

are taken to convey precisely the same meaning. A general statement of this truth would be: x implies y is equivalent to the phrase, either x is untrue or y is true. In the subsequent chapters we shall express the *denial* of "x implies y" by means of the expression, "x does not imply y."

THE CATEGORICAL FORMS AND THEIR DIAGRAMMATICAL REPRESENTATION

It only remains to explain the categorical forms and the notation which has been introduced to represent them. In the propositions, A(ab), E(ab),

I(*ab*), and O(*ab*), the terms are the **subject** *a,* which is written first in the bracket, and the **predicate** *b,* which is written second, and the **term-order** is the order subject-predicate. When we wish to indicate that the term-order is not settled, we shall place a comma in the bracket between the terms. Thus, A(*a, b*) may mean either "all *a* is *b*" or "all *b* is *a.*"

"All *a* is *b*" asserts that all the members of the *a* class are contained among the members of the *b* class, leaving it undetermined whether the members of the subject class are related to the members of the predicate class through identity, or exhaust only a part of the members of that class. Accordingly, the word *some,* in the sense of *some at least, possibly all,* is understood, if not expressed, before the predicate term, and it is this sense which the word will always convey in our subsequent theory. The meaning of the assertion, "all *a* is *b,*" may be illustrated by the following diagram (Fig. 1), that is, if "all *a* is *b*" is a true proposition, then the class *a* is related to the class *b* in one of these two ways,

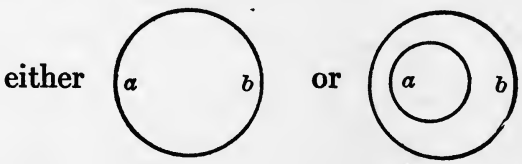

FIG. 1

The diagrammatic representation of the other categorical forms is given (in Figs. 2, 3, 4) below:

No *a* is *b*

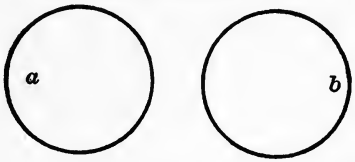

FIG. 2

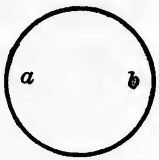
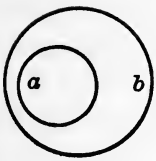
Some *a* is *b*

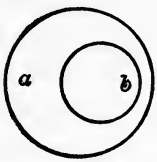
either



or



or



or

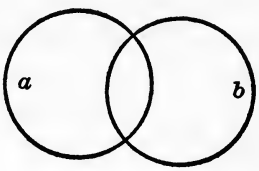


FIG. 3

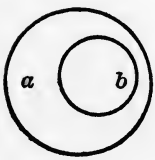
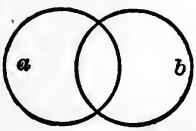
Some *a* is not *b*

either



or



or

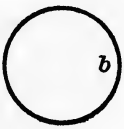


FIG. 4

These propositions are the ones employed in the classical logic, the science which has descended to us from Aristotle. The peculiar simplicity which is introduced into logic by the selection of this particular set of categorical forms depends upon the fact that the denial of any one involves the assertion of one of the others. Thus the denial of A is the assertion of O, and conversely; the denial of E is the assertion of I, and conversely.

EXERCISES

1. Are the following sentences propositions, and why?

> "Can it be possible that this old hermit has heard nothing of the report that God is dead!"
> —NIETZSCHE, *Thus spake Zarathustra.*

> "Necessity knows no law. . . . Behold the eleventh commandment, the message you bring to the world to-day, sons of Kant!"
> —ROLLAND, *Au-dessus de la mêlée.*

> "Render to Cæsar the things that are Cæsar's, and to God the things that are God's."
> —*Mark,* xii: 17.

2. Render the sense of the following sentence in the form of a conjunction:

> "The race is not to the swift, nor the battle to the strong."
> —*Ecclesiastes,* ix: 11.

and the sense of the following sentence in the form of a disjunction:

"Of making many books there is no end; and much study is a weariness of the flesh."

—*Ecclesiastes*, xii: 12.

3. Express the following disjunction in the hypothetical form:

"Either Bacon and Shakespeare are not the same person or else the moon is made of green cheese,"

and the following implication in the form of a disjunction:

"If you do not accept this truth, you must go without it."

4. Express the following sentences in categorical form:

"The heart hath its own reasons, which are unknown to reason."

—PASCAL.

"A nation free from prejudice soon becomes a free nation."

—CONDORCET.

"The brain in some sort digests impressions; it produces an organic secretion of thought."

—CABANIS.

5. The word *true* means true in all instances. Distinguish between the meaning of the phrase, *not necessarily true*, and the phrase, *necessarily not true*, and state general propositions which illustrate each meaning.

FALLACIES

CHAPTER IV

HISTORICAL CHANGES IN MEANING

Since ambiguity in the meaning of a word or phrase is perhaps the most fertile source of error, when we come to apply the rules of correct thinking, it is important for the student to be aware of some of the ways in which these ambiguities arise. **Semasiology,** whose problem it is to set forth the causes of these changes in meaning, is a field as yet but imperfectly explored. We shall be content to enumerate a few of the commonest cases in which old signs tend to disappear, and new ones arise to replace them.[1]

We note in the first instance that two *synonymes which are exact tend to differentiate in meaning.* De Quincey observes: "all languages tend to clear themselves of synonymes, as intellectual culture advances; the superfluous words being taken up and appropriated by new shades and combinations of thought evolved in the progress of society. And long before this appropriation is fixed and petrified, as it were, into the acknowledged vocabu-

[1] Some of the examples in this chapter are borrowed from Jevons, but by far the larger number are taken from Bréal, *Essai de Sémantique,* Paris, 1897.

lary of the language, an insensible *clinamen* (to borrow a Lucretian word) prepares the way for it. Thus, for instance, before Mr. Wordsworth had unveiled the great philosophic distinction between the powers of *fancy* and *imagination,* the two words had begun to diverge from each other, the first being used to express a faculty somewhat capricious and exempted from law, the other to express a faculty more self-determined.

When, therefore, it was at length perceived that under an apparent unity of meaning there lurked a real dualism, and for philosophic purposes it was necessary that this distinction should have its appropriate expression, this necessity was met half way by the *clinamen* which had already affected the popular usage of the words."

In Brittany, says the Abbé Rousselot, gardens were formerly called *courtils.* The rustic word which is now displaced as the usual term, is still used in a contemptuous sense. Similarly, with the introduction of the word *hotel,* the German *Wirtshaus, Wirtschaft,* has come to designate an inn of the less pretentious type. Again, to take an illustration from the philosophical dictionary, the Greek ἀρχαί (principles) and στοιχεῖα (elements) were certainly synonymous in the time of Thales, at least in the sense in which they were used by him. But this philosopher was severely reproached by Plato for not having distinguished between them.

LAW OF GENERALIZATION

Again, *words of special signification may take on a more general sense.* English *gain,* which has been influenced by the French *gagner* (to pasture), *le gagneur* (the cultivator), *le gain* (the harvest), means now, in either language, profit of any sort. Latin *pecunia,* originally wealth in live stock, came in the end to designate riches of whatever kind. French *temps* (time) meant at first heat (temperature), and afterward the weather, until finally the abstract idea of duration came to be attached to it. The Greek word χαραχτήρ denoted an engraving tool, but it soon came to be applied to the letters or signs engraved, a sense still preserved when we speak of the Greek characters. It was then extended by a sort of metaphor to whatever is regarded as the essential sign of any object whatever. The word *prince* has a sense much less special than the source from which it came, the *princeps senatus.*

Even proper names in certain instances may become generalized. Thus, in Rome *Cæsar* soon came to designate the emperor, and its modern derivative, czar, has even produced the abstract term, czarism. An adjective *Fabian* has been formed from the name of the Roman general Quintus Fabius Maximus, and any policy of procrastination or delay which postpones a decision is characterized as Fabian. The tower built on the island

of Pharos near Alexandria has produced in several languages the name "Pharos" as a synonyme for lighthouse. Again, while there was in the beginning but one sun and one moon, we now speak of the fixed stars as *suns* and we refer to the satellites of Jupiter as the *moons* of Jupiter.

LAW OF SPECIALIZATION

A tendency which is precisely the opposite of the one that has just been recorded is constantly taking place in the formation of a language. *Words of a general signification may take on a special or more restricted meaning.* Thus, in the Middle Ages the word *species* employed by the purveyors of drugs to designate the kinds of ingredients which they sold (saffron, clove, cinnamon, nutmeg) became, when it again entered the colloquial language, the French *épices,* English *spice.* German *Muth* (courage) originally of a more general signification, which is preserved in the derivatives *Hochmuth* (pride), *Grossmuth* (generosity) etc., and roughly rendered by English *mood,* probably derived its special meaning from words like *Rittersmuth, Mannesmuth,* etc. English *wit,* while tending to become specialized, still preserves its archaic sense of "shrewdness" or "intelligence" in the phrase *mother wit.* Many other examples might be given. *Urbs,* the name of Rome for the country folk of Latium, became, because of the Roman legions, the

name familiar to the whole of the ancient world. *Physician,* from φύσις (nature), has become so far specialized that a new word, *physicist,* had to be invented to express the original meaning. This word in turn has shown the same tendency, and there is now no commonly accepted term by which may be designated a scientist, whose interest is primarily in nature—*i.e.,* in nature as contrasted with man. The word *pope* (Latin *papa*) may have originated as a term of endearment (little father), employed, perhaps, in much the way in which the French now speak of Papa Joffre.

The following remarks of De Morgan deserve to be quoted in full: "The word *publication* has gradually changed its meaning, except in the courts of law. It stood for *communication to others,* without reference to the mode of communication or the number of recipients. Gradually, as printing became the easiest and most usual mode of publication, and consequently the one most frequently resorted to, the word acquired its modern meaning; if we say a man publishes his travels, we mean that he writes and prints a book descriptive of them. I suspect that many persons have come within the danger of the law, by not knowing that to write a letter which contains defamation, and to send it to another person to read, is *publishing a libel;* that is, by imagining that they were safe from the consequences of publishing, as long as they did not

print. In the same manner, the well-established rule that the first publisher of a discovery is to be held the discoverer, unless the contrary can be proved, is misunderstood by many, who put the word printer in the place of publisher. I could almost fancy that some persons think rules ought to travel in meaning, with the words in which they are expressed."

Sometimes an abstract word may become the name of an object. The Latin *vestis* (the act of clothing oneself) became in course of time the name of a particular garment. The Latin ending *-tas* (as in *dignitas, cupiditas*) served to form a substantive expressing a quality. But *civitas,* which meant at first the quality of being a citizen, came to designate the totality of citizens and finally stood for "the city" itself. German *Kind* came in course of time to mean "infant," though originally it referred to "the race."

TRANSFER OF MEANING BY ANALOGY

Besides the two processes described above as **generalization** and **specialization,** the senses in which a word may be employed may be merely *multiplied.* This transpires most commonly by the transfer of meaning through the use of **analogy** or **metaphor.** Thus, in Latin "intelligence" is like a point which penetrates (*acumen*), while "folly" resembles a blunt knife (*hebes*). At Rome there took place,

every five years, a census accompanied by a religious ceremony called "purification" (*lustrum, lustratio*). Since on this occasion the magistrates and the priests walked among the crowds, the verb *lustrare* came to mean "to pass in review." Cicero expressed astonishment that the Roman peasants should have given the name pearl (*gemma*) to the buds of trees. Actually the change by metaphor had been in the opposite sense, for pearls were so named because of their resemblance to buds about to burst. Again, *rivalis* designated neighbors on the opposite sides of a stream or who used the same water supply, but came to designate later on any sort of rivalry whatever. The word *influence* goes back to ancient astrological superstitions; it was supposed that a certain fluid escaped from the stars to predetermine the destiny of men and events.

Some of Archbishop Whately's examples of the transfer of meaning by analogy are worth recording. He says: "A blade, of grass, or of a sword, have the same name from direct resemblance between the things themselves. But instances of this kind are far less common than those in which the same name is applied to two things, not from their being *themselves* similar, but from their having *similar relations* to certain other things. And this is what is called analogy. Thus, the sweetness of a sound and of a taste can have no *resemblance:* but the word is applied to both, by *analogy,* be-

cause as a sweet taste *gratifies* the palate, so does a sweet sound, the ear. Thus, we speak in the analogical sense of the hands of a clock, the legs of a table, the foot of a mountain, the mouth of a river, . . . from the *similar relations* in which they stand to other things, respectively, in reference to use, position, action, etc.

"The words pertaining to *mind* may in general be traced up, as borrowed (which no doubt they all were, originally) by analogy, from those pertaining to *matter:* though in many cases the primary sense has become obsolete. Thus 'edify' in its primary sense of 'build up' is used, and the origin of it often forgotten; although the substantive 'edifice' remains in common use in a corresponding sense. When, however, we speak of 'weighing' the reasons on both sides—of 'seeing' or 'feeling' the force of an argument—'imprinting' anything on the memory, etc., we are aware of these words being used analogically."

EXERCISES[1]

1. How would you explain the fact that the first two words in the following lists are Saxon and the last two Norman?

(a) home, hearth; palace, castle.
(b) boor, churl; duke, count.
(c) ox, deer; beef, venison.

2. How did *miscreant* (misbeliever) acquire its present sense?

[1] These examples have been taken from Trench, *On the Study of Words.*

3. How could *dunce* have been derived from Duns Scotus, the "subtle doctor," the great teacher of the Franciscan order?
4. As the result of a false science, *crystals* were so named because of their resemblance to ice, which was then supposed to have "lost its fluidity." Explain the words: jovial, saturnine, mercurial, disastrous, ill-starred.
5. According to an ancient theory of medicine, the disposition of mind and body depends upon a proper proportion of four principal moistures (humors). Explain: good humor, bad humor, dry humor.
6. Occasionally a name will embody some original error. Explain the words: America, Turkey, dinde (French), gypsies.
7. On being asked of what city he was, Diogenes replied that he was a cosmopolite. How must this reply have sounded to Greek ears?
8. By which one of the causes enumerated in this chapter would you explain the change in the following words from their primary to their secondary meaning: caprice, halcyon, voluble, temper, spirit, prude, loyalty, journal, minion, knave, roué?
9. What facts may be inferred from the history of the words: thrall, paper, stipulation, expend, calculate?

CHAPTER V

SEMI-LOGICAL AND MATERIAL FALLACIES

The term **fallacy** in the narrow or technical sense is used to designate some breach of the rules of correct inference; in the broader, more popular sense it denotes any one of the numberless ways in which men may fall into error. **Sophism, paradox,** and **paralogism** are inexact synonymes of this word and have a great variety of meaning. Thus paradoxical may be applied to an argument, which merely appears to be an offense against logic, or to a point of view which seems to offend common sense, or which only is beyond common apprehension. A sophism denotes ordinarily an argument which deceives not the author of it, but his opponent only, or which places the burden of the proof upon the latter. A paralogism may mean a special tendency of the mind to adopt an error of a particular kind, and in this sense it is employed by the German philosopher Kant. Fallacies commonly hinge upon an ambiguity in the meaning of terms or relationships. Thus it may appear *paradoxical* that this word and its synonymes should exhibit on their own part such a wide range of ambiguity.

PARADOX REMOVED BY EXTENDING THE MEANING OF TERMS OR RELATIONSHIPS

It is well known to the mathematician that he has often to extend the sense of his terms or of his symbols of relationship in order to take account of cases not suspected, when his definitions were set down. Thus, the primitive sense attaching to quantity will not permit of the interpretation of imaginaries. This, one of the prime difficulties which the beginner in algebra has to overcome, depends upon his instinctively holding to the *original* meaning of quantity, while striving to grasp the *new*. Many of the paralogisms of the older logicians depend upon their inability to generalize their conceptions, when they have met with special cases that resist interpretation. One would like, for example, to be able to say: If a is a class and b is a class, then what is a and b is a class, and what is either a or b is a class. But this will involve the conception of a class that has no members, and such a class has *peculiar* (*i.e., paradoxical*) properties. Thus the members of the class squares and the members of the class circles have no members in common and these latter are contained in and are also excluded from the members of any other class whatsoever. The corresponding notion of a proposition, that is true under no circumstances, is one with which the older logicians could not deal, and hence

for them paradoxical, although it is habitual and conscious in popular usage and is, therefore, recognized by common sense;

> "I will not be afraid of death and bane
> Till Birnam forest come to Dunsinane"

means: "I will not be afraid till what must forever remain untrue comes true; till an impossibility is possible; an emphatic way of saying, 'without qualification, I will not be afraid.' " Again:

> "Nay, had I power, I should
> Pour the sweet milk of concord into hell,
> Uproar the universal peace, confound
> All unity on earth,"

the meaning being, in part: if the consequent be false (I *shall* pour, etc.), then so is the antecedent false (I *have* the power), for an asserted implication is taken to be true. This sense is here rendered unambiguous by the use of the conditional.

EQUIVOCATION AND AMPHIBOLOGY

Many fallacies that arise because of the ambiguity of terms, and which are listed in the manuals of logic, are not intended seriously. Such are jests or puns. A famous case of punning is found in the conversation of Hamlet with the gravedigger:

Ham.—Whose grave's this, sirrah?
Clo.—Mine, sir.
Ham.—I think it be thine indeed, for thou liest in't.
Clo.—You lie out on't, sir, and therefore 'tis not yours: for my part, I do not lie in't, and yet it is mine.

Franklin's well-known remark (on the occasion, I imagine it was, of the signers attaching their names to the Declaration) might or might not be taken seriously, except for its logic, "If we do not hang together, gentlemen, we may expect, each one of us, to hang separately." There are cases in which one cannot be quite sure whether an ambiguity is intended or not. Suppose, for example, the assertion: "Shakespeare did not create the plays. They were conceived by another of the same name." If Mark Twain be the author of this saying, it is at once clear that an ambiguity is intended, but another author may intend to say that Bacon published them under an assumed name. A fallacy which depends upon the ambiguity of a single word is commonly called **equivocation;** if it consists in the ambiguity of a sentence or phrase, it is termed **amphibology.** As an illustration of the fallacy of equivocation consider the following argument for a protective tariff: "When we buy in a foreign country, we get the goods and they get the money, and

when we sell in a foreign country, they get the goods and we get the money. How much better, then, to buy and sell in our own country, for in that case we retain both the goods and the money." The following would constitute an equally good (*and* an equally bad) retort: "When we buy in our own country, the producer loses the goods and the consumer loses the money. But the consumers and the producers make up the entire community. Therefore, when we buy in our own country, we lose both the goods and the money."

An historical dispute as to whether logic is a science or an art depends, probably, upon an ambiguity in the original meaning of the word. Logic is from a Greek word, λογική, an adjective with some substantive understood, which in turn is derived from λόγος. This word possessed a twofold sense, denoting both man's thought and his expression of it, a distinction exactly rendered by the two Latin words, *ratio* and *oratio*. The same equivocation was carried by the derivative λογική, and hence arose, no doubt, the dispute as to whether logic deals with the laws of thought or with the laws of the expression of thought.

FALLACY OF ACCENT

Whenever the sense of an assertion is changed, because the emphasis is thrown on some particular word, the **fallacy of accent** occurs. A certain bar-

ber is supposed to have invited patronage by placing before his shop a sign which contained the following (unpunctuated) statement:

"What do you think
I'll shave you for nothing
And give you a drink"

The visitor, once shaved and having demanded his drink, would be taken outside before the sign, which the barber would then read:

"What! do you think
I'll shave you for nothing
And give you a drink?"

Another instance, which has even led to sectarian controversy, is the meaning of the phrase, "Drink ye all of it." Shall we say, "Drink ye *all* of it," or rather, "Drink ye all *of* it"?

FALLACY OF MANY QUESTIONS

To the fallacy of **many questions** are usually referred all cases in which too many meanings are contained, or in which the issue on that account is generally confused. A good example is the conversation in Hamlet between the gravediggers. Here the first remark is not in the form of a question, but calls, none the less, for a reply. The fallacy might be termed equally well

the fallacy of **many statements.** The example will illustrate, too, what is called in logic a case of **non sequitur.**

> *First Clo.*—If the man go to this water and drown himself, it is, will he, nill he, he goes; mark you that; but if the water come to him and drown him, he drowns not himself: argal, he, that is not guilty of his own death, shortens not his own life.
> *Second Clo.*—Will you ha' the truth on't? If this had not been a gentlewoman, she should have been buried out of Christian burial.

Other fallacies are committed without the intention that they be taken seriously. Polonius conveys a sly hint to Hamlet when he says:

> "If you call me Jeptha, my lord,
> I have a daughter that I love passing well";

and Hamlet as slyly escapes by pretending that the remark contains a formal fallacy, for he rejoins:

> "Nay, that follows not."

Nothing brings a conversation more abruptly to an end or more quickly disarms an opponent than the habit of taking him literally, for, arguing as it does a lack of imagination and even a lack of intel-

lect, he is at once aware that the discussion cannot be maintained on the projected level. Nor does this habit characterize the unlettered only. Many an excellent scholar will betray the essential poverty of his mind by traits which point the same moral, by his attachment to words rather than meanings, or by his scorn of a style that is elegant because elevated, or, again, let us say, by his liking for what he calls the *impersonal* (*i.e.* literal) narration of history. De Morgan remarks that "the genius of uncultivated nations leads them to place undue force in the verbal meaning of engagements and admissions, independently of the understanding with which they are made. Jacob kept the blessing which he obtained by a trick, though it was intended for Esau; Lycurgus seems to have fairly bound the Spartans to follow his laws till he returned, though he only intimated a short absence, and made it eternal."

FALLACY OF ACCIDENT

The same writer recounts the following tale from Boccaccio, a tale in which the man appears to have possessed more of *esprit* than his master, but who could hardly have expected to be taken too literally: "A servant who was roasting a stork for his master was prevailed upon by his sweetheart to cut off a leg for her to eat. When the bird came upon table, the master desired to know what had

become of the other leg. The man answered that storks had never more than one leg. The master, very angry, but determined to strike his servant dumb before he punished him, took him next day into the fields where they saw storks, standing each on one leg, as storks do. The servant turned triumphantly to his master; on which the latter shouted, and the birds put down their other legs and flew away. 'Ah, sir,' said the servant, 'you did not shout to the stork at dinner yesterday; if you had done so, he would have shown his other leg, too.' " The servant was here guilty of what logicians call the **fallacia accidentis,** of predicating of roasted storks what can only be predicated generally of storks. But the fallacy of accident may easily involve us in serious difficulties. The illustration below, taken from De Morgan, deserves to be quoted in full:

"The law in criminal cases demands a degree of accuracy in the statement of the *secundum quid* which many people think is absurd. . . . Take two instances as follows: Some years ago, a man was tried for stealing a ham, and was acquitted upon the ground that what was proved against him was that he had stolen a portion of a ham. Very recently, a man was convicted of perjury, "in the year 1846," and an objection (which the judge thought of importance enough to reserve) was taken, on the ground that it ought to have been

"in the year *of our Lord* 1846." . . . In the two instances, which by many will be held equally absurd, a great difference will be seen by anyone who will imagine the two descriptions, in each case, to be put before two different persons. One is told that a man has stolen a ham; another that he has stolen a part of a ham. The first will think he has robbed a provision warehouse, and is a deliberate thief; the second may suppose that he has pilfered from a cook shop, possibly from hunger. As things stand, the two descriptions may suggest different amounts of criminality, and different motives. But put the second pair of descriptions in the same way. One person is told that a man perjured himself in the year 1846; and another, that he perjured himself in the year of our Lord 1846. As things stand, there is no imaginable difference; for there is only one era from which we reckon."

CONSCIOUS AMBIGUITIES

There is another large and important class of fallacies rather neglected, I think, by the logicians; arguments, which are not to be taken literally, but for a reason very different from the one that applies to the illustrations enumerated above. These are statements which are formally correct, but in which an ambiguity of terminology is *intended,* it may be for rhetorical purposes. Even the unlettered will not take you literally, if you remark that

"business is business." The formal correctness of the phrase tends to force its acceptance, but it is quite evident that more is meant than meets the ear. Again, if I assert that "man is a vertical animal," it will be clear that more than a mere tautology is meant. It is said of Lincoln, while making a tour of the trenches after a brisk fight, that he remarked, with evident disgust of the whole affair (I quote from memory), "Anyone who likes this sort of thing must enjoy it very much." If it be said that "a man is a man for all that," it is to call attention to the fact that a tautology is not always true; that rather "a man is not himself *sometimes.*" When the king and the others have left the play and Hamlet is left alone with Horatio, he says:

> "For if the king like not the comedy,
> Why then, belike, he likes it not, perdy,"

meaning that the burden of a bad conscience is the king's and not his.

Professor Stratton in an article appearing in the *Atlantic Monthly* says: "It is a prevailing belief that the mind is a convenient name for countless special operations or functions" and that these are independent. "When you have trained one of these you have trained that limited function and none other. What you do to the mind by way of education knows its place; it never spreads. *You train*

what you train." Here the formal correctness of the tautology seems to reinforce the argument. But this view of the character of mind ignores many important facts. "The psychological experiments which have so troubled the waters of education prove that normally *you train what you do not train.*" And, again, the conscious fallacy, the deliberate offense against logic, is correctly employed in favor of the opposite view.

In those verses of Lewis Carroll, which he calls "The Three Voices," the man in the piece, who has been accused by the lady of giving himself over to the exclusive instincts of his gourmandizing self, urges in his own defense that

"Dinner is dinner, tea is tea."

His defense is undermined, however, by her resolve to take his statement only at its face value, for she replies:

"Yet, wherefore cease, let thy
scant knowledge find increase;
say men are men, and geese are geese."

Here the intent is not only to overthrow the opponent's argument, to render his contention impotent by refusing his implied ambiguity; but also to make a joke at the erpense of logic itself, which is thus charged with giving us in its implications no information that we did not have before.

IGNORATIO ELENCHI

Again, an opponent may be disarmed for the moment by a statement that, while true, is irrelevant; what is called in logic the **ignoratio elenchi.** Thus Hamlet avoids telling his secret to Horatio and Marcellus by a reply that, to them at least, seems to have no bearing on the case. He says:

> "There's ne'er a villain dwelling in all
> Denmark
> But he's an arrant knave,"

and Horatio replies, quite properly:

> "There needs no ghost, my lord, come from
> the grave,
> To tell us this";

but Hamlet escapes again by simple agreement with this statement in its literal sense and by refusing to seek its implications. He rejoins:

> "Why, right; you are in the right;
> And so, without more circumstance at all,
> I hold it fit, that we shake hands, and part."

Agreement on the part of disputants is the end of discussion. It is said of the Frenchman Fontenelle, that he so far detested all forms of argument that he would refuse to differ with his opponent, em-

ploying habitually the phrase, *tout est possible,* whenever debate threatened. Another case in which an admission by an opponent may be taken unfairly, or, it may be, ironically, so that argument is effectually ended, is cited by De Morgan. "A writer disclaims attempting a certain task as above his powers, or doubts about deciding a proposition as beyond his knowledge. A self-sufficient opponent is very effective in assuring him that his diffidence is highly commendable, and fully justified in the circumstances."

AMBIGUITIES OF COMMON WORDS

Some of the ambiguities to which very common words are liable give rise to misunderstandings that are sometimes serious. Such words as the adjectives of quantity, *all* and *some,* the definite article, *the,* and the copula, *is,* come under this head. The assertions, "all of the angles of a triangle equal two right angles" and "all of the angles of a triangle are less than two right angles," are both true, if *all* is taken collectively in the first instance and distributively in the second. The phrases, "all of these twelve men are a jury" and "all of these men are liable to be prosecuted" illustrate the same ambiguity. In Rousseau's conception of the social contract it is said that each member of society is called upon to surrender *all* his rights in order that the rights of *all* may be preserved—a result that may

appear paradoxical at first blush, until the equivocation in the use of the italicized word is noticed. In the phrase,

Chacun se donnant a tous ne se donne a personne,

the meaning is quite clear and unambiguous. The Latin *omnis* preserves the same double meaning. Thus the state of savage man is described as the *bellum omnium contra omnes.* The word, *both,* is similarly equivocal. If I say, "Both this man and his wife are either male or female," the case is true in the distributive but untrue in the collective sense of *both;* and the opposite will hold if I say, "This man can walk on both legs." But, "A man can hop on both legs" is true in either sense.

One of the chief difficulties of the logic of Hamilton depends on the ambiguity of the meaning of *some.* Of this word he says: "A remarkable uncertainty prevails in regard to the meaning of particularity and its signs. Here *some* may mean *some only—some, not all,"* and is "definite in so far as it excludes omnitude." Thus, "Some Greeks are Athenians." "On the other hand, *some* may mean *some at least—some, perhaps all."* Thus, "Some men are rational animals" where man is defined as a rational animal. If it be argued that "Socrates is a man and man is a class, therefore Socrates is a class," there are those who will find here an am-

biguity in the meaning of the copula or else in the meaning of the singular term. ither Socrates is regarded as a class of one member, they will say, or the relation of an individual to a class is to be distinguished from the relation of a class to a class. The definite article in English sometimes generalizes and sometimes individualizes. "The animal" is general when we speak of the "the animal in man," but otherwise when we say, "Have no fear, the animal will find his way home." Generally it is remarked, *"Man is unfaithful,"* but, *"The dog* is faithful to man." In Greek, in French, in German, on the contrary, the definite article is required before *man,* when the word is intended in the universal sense.

PETITIO PRINCIPII

It is generally true, and is, indeed, set down as one of the axioms of logic, that, if two propositions are true together, then either one of them may be assumed separately to be true. The statement will perhaps appear trivial, but a serious fallacy frequently arises in connection with it, and in the following way: Suppose that, in order to prove a given proposition, we should assume two others, such that one or both of the two assumed ones should be merely a disguised expression of the given one. If we should suppress the premises and assert the conclusion by itself, we should

then virtually assume the conclusion—that is, by assuming the right to suppress the premise equivalent to it. Such a fallacy is known as a **petitio principii.**

Serious instances of this fallacy are not uncommon in the history of science. Thus, most of the apparently successful efforts to demonstrate the so-called parallel axiom of Euclid are breaches of this rule. The demonstrator commonly takes for granted, intuitively, some principle which is equivalent to the result he seeks. The great geometer Gauss, writing on his efforts to effect this proof to his friend Wolfgang von Bolyai in the year 1799, says: "Certainly I have come upon much that for the majority would pass as a proof, but in my eyes demonstrates nothing." He then goes on to enunciate equivalent propositions that would be covertly taken for granted by many, but whose assumption would constitute a *petitio principii.* If the student will realize that for two thousand years mathematicians had struggled with this proof, the same fallacy being committed again and again, he will appreciate the seriousness of the difficulty. De Morgan relates that the mathematician Lagrange once wrote a memoir on the theory of parallels. While presenting it to the members of the French Academy, he withdrew the manuscript in the middle of the reading with the remark, *"Il faut que j'y songe encore."*

ACHILLES AND THE TORTOISE

In concluding this chapter on fallacies we shall include the case of a famous sophism which Zeno the Eleatic employed, in order to prove that motion is impossible. It is known as the paradox of Achilles and the tortoise. De Quincey gives the following account in one of his essays, and, as it cannot be better related, we shall quote him in full:

"Achilles, most of us know, is celebrated in the 'Iliad' as the swift-footed (ποδας ωκυς Αχιλλευς); and the tortoise, perhaps all of us know, is equally celebrated among naturalists as the slow-footed. In any race, therefore, between such parties, according to the equities of Newmarket and Doncaster, where artificial compensations as to the weight of riders are used to redress those natural advantages that would else be unfair, Achilles must grant to the tortoise the benefit of starting first. But if he does *that,* says the Greek sophist, then I, the sophist, back the tortoise to any amount, engaging that the goddess-born hero shall never come up with the poor reptile. Let us see. It matters little what exact amount of precedency is conceded to the tortoise; but say that he is allowed a start of one-tenth part of the whole course. Quite as little does it matter by what ratio of speed Achilles surpasses the tortoise; but suppose this ratio to be that of ten to one, then, if the racecourse be ten miles long, our

friend the slow-coach, being by the conditions entitled to one-tenth of the course for his starting allowance, will have finished one mile as a *solo* performer before Achilles is entitled to move. When the *duet* begins, the tortoise will be entering on the second mile precisely as Achilles enters on the first. But, because the Nob runs ten times as fast as the Snob, whilst Achilles is running his first mile, the tortoise accomplishes only the tenth part of the second mile. Not much, you say. Certainly not very much, but quite enough to keep the reptile in advance of the hero. This hero, being very little addicted to think small beer of himself, begins to fancy that it will cost him too trivial an effort to run ahead of his opponent. But don't let him shout before he is out of the wood. For, though he soon runs over that tenth of a mile which the tortoise has already finished, even this costs him a certain time, however brief. And during that time the tortoise will have finished a corresponding subsection of the course—*viz.*, the tenth part of a tenth part. This fraction is a hundredth part of the total distance. Trifle as that is, it constitutes a debt against Achilles, which debt *must* be paid. And whilst he *is* paying it, behold our dull friend in the shell has run the tenth part of a hundredth part, which amounts to a thousandth part. To the goddess-born what a flea bite is that! True, it is so; but still it lasts long enough to give the tortoise time

for keeping his distance, and for drawing another little bill upon Achilles for a ten-thousandth part. Always, in fact, alight upon what stage you will of the race, there is a little arrear to be settled between the parties and always *against* the hero. 'Vermin, in account with the divine and long-legged Pelides, Cr. by one billionth or one decillionth of the course,' much or little, what matters it, so long as the divine man cannot pay it off before another installment becomes due? And pay it off he never will, though the race should last for a thousand centuries."

It may be argued (as indeed it has been) that we can easily calculate the exact spot where Achilles will overtake the tortoise. But such a solution clearly misses the point. "Of course . . . it becomes easy, upon assuming a certain number of feet for the stride of Achilles, to mark the precise point at which that 'impiger' young gentleman will fly past his antagonist like a pistol shot, and being also *'iracundus, inexorabilis, acer,'* will endeavor to leave his blessing with the tortoise in the shape of a kick (though, according to a picturesque remark of Sidney Smith, it is as vain to caress a tortoise, or, on the other hand, to kick him, as it is to pat and fondle, or to tickle, the dome of St. Paul's)."

It is often said, somewhat patronizingly, that had Zeno grasped the modern notion of a differential coefficient, the limiting value of the ratio of two infinitesimals, there would have been no paradox.

This is the solution of Leibnitz and it is the one which De Quincey accepts. "The infinity of space in this race of subdivision is artfully run against a *finite* time; whereas, if the one infinite were pitted, as in reason it ought to be, against the other infinite, the endless divisibility of time against the endless divisibility of space, there would arise a reciprocal exhaustion and neutralization that would swallow up the astounding consequences, very much as the two Kilkenny cats ate up each other."

It must be remarked, however, that this solution is equally beside the point. The real difficulty, when the argument is properly stated, is to come to the end of an infinite series—that is, to come to the end of something that has no end by definition. The real fallacy, I believe, lies in an ambiguity in definition. The arguer defines an infinite series as one which has no *last term,* and later revokes the condition for his opponent, reinserting the last term as something that has to be passed through *for him.* Briefly the steps are these: "Achilles, in order to catch the tortoise, must pass through the last term of an infinite series. But an infinite series *has no* last term. Accordingly, in order to catch the tortoise, Achilles must do that which (by definition) he cannot do." The solution is to reject the major of this syllogism. If the series has no last term there is no need to pass through *a last term* in order to reach the limit. The last term, which is excluded

as a *possible* obstacle in the original definition, is reinvoked as a *real* obstacle for him against whom the argument is directed.

Exercises

1. Given an original illustration of each one of the fallacies specifically named in this chapter.
2. Examine the following statements and set forth clearly the sophism or paradox therein contained:

   A man accustomed to put his trust in dreams, one night dreamed that all dreams are vain. (From Jeremy Taylor's sermon on "The Deceitfulness of the Heart.")

   The Cretan Epimenides says that "all the Cretans are liars."

   The riches of a producer depend on the scarcity of his commodity. (From Bastiat, *Sophismes Économiques.*)

   Wealth consists in the abundance of things. The many who have little, combine to protect the few who have much.

3. Select from the following such as contain a "circle" in definition:

   Exceptive propositions affirm a predicate of all the subject with the exception of certain defined cases.

   An *affirmative* proposition is one in which an agreement is affirmed between the subject and the predicate.

   A *number* is anything which is the number of some class.

By the *mass* of a body is meant the quantity of matter contained in the body.

Force is that which tends to modify motion.

4. What ambiguities are implied in the following expressions:

"With respect to the appearance of this work (Fichte's *Characteristics of the Present Age*), I have nothing further to say to the Public than that I have nothing to say."

"Let anyone who reads this work without understanding it, assume no more than this: that he does not understand it."

"I have no other but a woman's reason,
I think him so, because I think him so."
—*Two Gentlemen of Verona,* Act I, Sc. ii.

"Non amo te, Sabidi, nec possum dicere quare;
Hoc tantum possum dicere, non amo te."
—MARTIAL, Ep. I., xxxiii.

5. Examine the argument given below in order to determine its validity or invalidity:

Differences cannot be expressed, for suppose two things, x and y to be different. Then we should say "x is not y. Now y is a way of existing and, consequently, not-y is a way of not existing; so that, in trying to express a difference, we have only said that x is a way of not existing."

IMMEDIATE INFERENCE

CHAPTER VI

THE UNIVERSE OF THE CATEGORICAL FORMS

We have seen that the categorical forms, A, E, I, and O, are composed of the terms (*a* and *b*), an adjective of quantity (*all, no, some, not all*) and the copula (*is*). In previous chapters we have noticed many cases in which the terms and their relations (*all is, no is, some is, not all is*) take on ambiguous meanings. In particular it has been said that the word *some* is to be taken in the sense of *some at least, possibly all.*

The student may well inquire by what right it is that we are allowed to understand this word in any sense we please. We reply that this meaning of the word is unambiguously forced upon us by the propositions which we say shall be true or untrue in our science. For example, we are going to say that

$$\mathrm{A}(ab) \text{ implies } \mathrm{I}(ab)$$

is a true, or valid, implication, and this would not be the case if *some* meant *some, not all.* We are going to say, too, that

$$\mathrm{I}(ab) \text{ implies } \mathrm{O}(ab)$$

is an untrue, or invalid, implication. But such an

implication would *follow,* would be true, if the word *some* were taken in this latter sense. We intend that the propositions which are valid or invalid in our system shall be confirmed as true or untrue by common sense. The meaning first given, *some, at least, possibly all,* is the interpretation which will be always verified in experience, when we come to apply our theory practically.

MEANING OF THE TRUE AND UNTRUE

There are two other words with which we shall have to deal, whose sense is best rendered ambiguous at the outset. Thus, *true* means *necessarily true,* true in all cases, true for all meanings of the terms. If the student were to represent the sense of "some a is b" by means of the diagram (Fig. 5) below

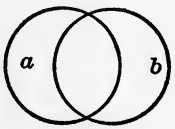

FIG. 5

it might then appear to him that the implication,

$$\text{I } (ab) \text{ implies O } (ab),$$

is true. That this is only an *apparent* truth, would

have been manifest at once, if he had employed instead either one of the diagrams of Fig. 6.

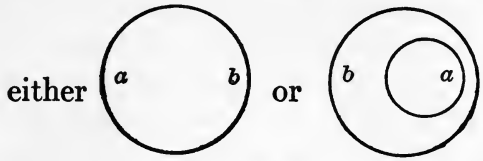

FIG. 6

as his representation of "some a is b."

The word *untrue,* in turn means *not necessarily true,* not true in every instance, not true for all meanings of the terms; that is, there is at least one set of meanings of the terms which will invalidate the proposition in question. Thus, in order to become aware that the implication,

$$\mathrm{I}(ab) \text{ implies } \mathrm{O}(ab),$$

is not generally true, it would be enough to point to *either one* of the diagrams of Fig. 6, or to assign appropriate concrete meanings to the terms. Thus if a stands for metals and b stands for elements,

"If some metals are elements,
then some metals are not elements,"

the untruth of the general statement is at once manifest. If the illustration selected had been

"If some red substances are elements,
then some red substances are compounds,"

the untruth of the original implication would not have been shown.

THE PROPOSITIONAL UNIVERSE

These matters being clear, we may pass to the chief topic of this chapter, which is to explain what is meant by the *universe* of the categorical forms and to define certain technical expressions. In the last chapter, when we represented the categorical propositions by means of diagrams, we assumed that there is a certain analogy between the manner in which closed areas overlap and the manner in which classes overlap. This analogy was first pointed out by the mathematician Euler in a popular work on "natural philosophy" entitled *Letters Addressed to a German Princess,* and such diagrams are, accordingly, referred to as Euler's diagrams. If the student will examine the figures set down at the end of the last chapter, it will be intuitively clear to him, if he assumes this analogy, that any two classes, *a* and *b,* must be related in one, and cannot be related in more than one, of the following five ways (Fig. 7):

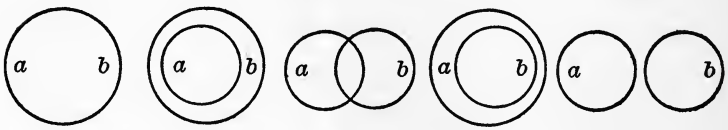

FIG. 7

These five cases may be conceived as five possibilities, one and only one of which can be realized in any particular case. That is, for any pair of concrete meanings of *a* and *b* (triangles and trilaterals, elements and compounds, Shakespearean scholars and Englishmen, etc.) one of the five possibilities is realized and the others remain unrealized. If I assert that one of these five representations is the true one, no matter what meanings the terms may take on, I assert something that is true. In the form of a disjunction the assertion would be, "Either the first, or the second, or the third, or the fourth, or the fifth possibility must be realized" for every meaning of *a* and *b*. This disjunction is called the **propositional universe,** or the **universe of the categorical forms,** or, again, the **logical sum** of all the possibilities.

If it is clear that at least one of these diagrams represents the true relation of *a* to *b,* it will be equally manifest that the relation of *a* to *b* cannot be represented in more than one of these five ways. If I assert the contrary to this last condition, I say something that is false. In the form of a conjunction this assertion would be, "Both the first (say) and the last (say) possibility are realized" at once. Such a conjunction is called the **propositional null,** or, again, the **logical product** of two or more of the possibilities.

CONTRADICTORIES, CONTRARIES, SUBCONTRARIES AND SUBALTERNS

By means of this conception of a propositional universe the more fundamental relations connecting the categorical forms may be established at once. Since "all *a* is *b*" asserts that one of the first two possibilities is realized and "some *a* is not *b*" asserts that one of the last three possibilities is realized, the disjunction,

"Either all *a* is *b* or some *a* is not *b*,"

—that is, the assertion that "either A is true or O is true," is precisely equivalent to the *propositional universe,* and is, therefore, of necessity a true statement. Similarly, the conjunction,

"All *a* is *b* and some *a* is not *b*,"

—is equivalent to the *propositional null,* and is false, for A and O contain no possibilities in common. Accordingly, A and O cannot both be true and cannot both be false.

In general, whenever two categorical propositions contain one or more possibilities in common, they may both be true, but not otherwise. Thus, I and O may both be true, but A and E cannot both be true. Whenever two categorical propositions, taken together, do not make up the universe of possibilities, they may both be false, but not otherwise.

Thus, A and E may both be false, but I and O cannot both be false.

We proceed to set down the following definitions, which will prove to be of great importance for our subsequent theory:

Two propositions which cannot both be true and cannot both be false are called **contradictories.**

Two propositions which cannot both be true but which may both be false are called **contraries.**

Two propositions which may both be true but which cannot both be false are called **subcontraries.**

Two propositions which may both be true and which may both be false are called **subalterns.**

The student who has made only a slight progress in his mathematical studies will still realize that we cannot classify the four assertions, A, E, I, and O, under these heads by a mere reference to a set of Euler's diagrams. The truths that we assume without demonstration must appear among our axioms, however "self-evident" they may otherwise seem. We accordingly assume:

Postulate 1.—A and O cannot both be true and cannot both be false.

Postulate 2.—E and I cannot both be true and cannot both be false.

From these assumptions it follows that A and O and that E and I are contradictory pairs. In the next chapter postulates and principles will be set down and theorems will be deduced from them,

by means of which it will be possible to say that A and E are contraries, that I and O are subcontraries, and that A and I, and E and O, are subalternate pairs. As a preliminary exercise, however, the student should scrupulously verify these facts for himself, employing the diagrams of Fig. 7 with this end in view. In order to facilitate this verification as well as to emphasize its importance, the figure is again reproduced on this page below.

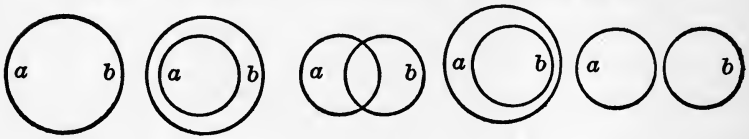

FIG. 8

EXERCISES

1. What propositions must be true and what ones must be false, when we take A, E, I, and O to be true in succession?
2. What propositions must be true and what ones must be false, when we take A, E, I, and O to be false in succession?
3. Draw a set of diagrams which will represent A, E, I, and O when the terms, *a* and *b*, have been reversed. In what cases does this alteration leave the original meaning unchanged?
4. In an argument your opponent has managed to establish the truth of a proposition, which is subcontrary to the one which you are maintaining yourself. How would you retort his contention?
5. Is it more desirable in an argument to establish the contrary of your opponent's view or the contradictory?
6. Assume that the first four of Euclid's axioms must be affirmed, but that either of the remaining two may be denied. If the fifth and sixth axioms are subcontraries, how many geometries different from Euclid's are possible?

CHAPTER VII

THE MOODS OF IMMEDIATE INFERENCE

In the hypothetical proposition, x implies y (if x is true, then y is true), the part x to the left of the word *implies* is called the **antecedent** and the part y to the right is called the **consequent.** Here x and y may stand for any sort of proposition, but if each one is a single categorical form, then we should replace x and y by a more definite notation, for example, "A(ab) implies I(ba)," "if E(ab) is true, then A(ab) is false," etc. Any implication of this latter specific type is known as **immediate inference.**

It will be recalled that the comma in the bracket between the terms is used in order to indicate that the term-order is not settled. Thus, just as O(a, b) may represent either O(ab) or O(ba), so all propositions like "A(a, b) implies A(b, a)" may have either one of two term arrangements. A difference between two forms of inference which is dependent on term-order alone is known as a difference of **figure.**

FIGURES OF IMMEDIATE INFERENCE

If the term-order in the antecedent is the same as the term-order in the consequent—that is, if,

for example, "A(a, b) implies A(a, b)" be written:

either "A(ab) implies A(ab),"
or "A(ba) implies A(ba),"

then "A(a, b) implies A(a, b)" is said to be expressed in the *first figure* of immediate inference. If the term-order in the antecedent is the reverse of the term-order in the consequent—that is, if, for example, "A(a, b) implies A(a, b)" be written,

either "A(ab) implies A(ba),"
or "A(ba) implies A(ab),"

then "A(a, b) implies A(a, b)" is said to be expressed in the *second figure* of immediate inference. It is clear that this implication will be true in the first, but untrue in the second figure, so that a difference of figure may very possibly involve a difference in the *truth-values* of the two cases.

ARRAY OF IMMEDIATE INFERENCE

It is evident that all the variants of immediate inference are to be gotten by permuting the four letters A, E, I, and O, two at a time, and by taking each letter once with itself. We should thus obtain sixteen distinct propositions of the type we are considering, as follows:

MOODS OF IMMEDIATE INFERENCE

A (a, b) implies A (a, b)
A (a, b) implies E (a, b)
A (a, b) implies I (a, b)
A (a, b) implies O (a, b)
E (a, b) implies A (a, b)
E (a, b) implies E (a, b)
E (a, b) implies I (a, b)
E (a, b) implies O (a, b)

I (a, b) implies A (a, b)
I (a, b) implies E (a, b)
I (a, b) implies I (a, b)
I (a, b) implies O (a, b)
O (a, b) implies A (a, b)
O (a, b) implies E (a, b)
O (a, b) implies I (a, b)
O (a, b) implies O (a, b)

It will be convenient from time to time to leave unexpressed the word *implies* and the (a, b) and to write down the same set of sixteen implications in the following more abbreviated fashion:

AA	EA	I A	OA
AE	EE	I E	OE
A I	E I	I I	O I
AO	EO	I O	OO

Each proposition of the set may be expressed in

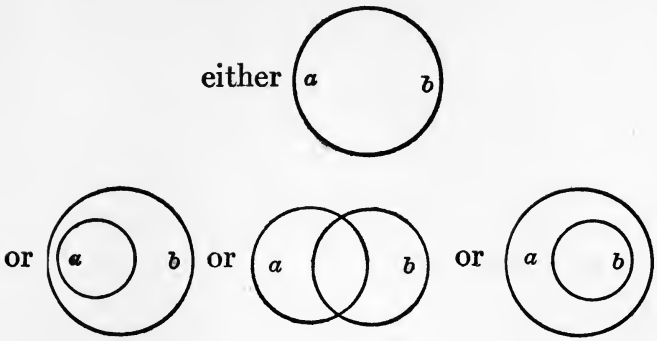
either the first or the second figure and there are, consequently, thirty-two possible forms of immediate inference. The entire set of thirty-two is said to constitute the **array** of immediate inference. Each member of the array is called a **mood** of the array. The true propositions of the array are called **valid moods** of the array. The remainder are called **invalid moods** of the array.

VALIDITY AND INVALIDITY DETERMINED BY EULER'S DIAGRAMS

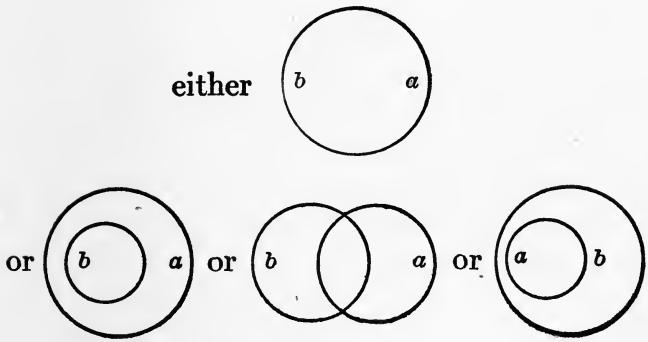
In order to determine precisely what are the valid and what are the invalid moods of this set, let us employ the method of inspection by means of diagrams which was explained in the last chapter. A few examples will suffice to illustrate this method. The student in completing the exercise which is here proposed, will do well to direct his attention to Fig. 7 of the last chapter.

(1) Consider the mood E(*ab*) implies O(*ab*), or, in our abbreviated notation, EO in the first figure. This asserts that if the fifth possibility (Fig. 7) is realized, then at least one of the last three possibilities is realized. It is intuitively evident then that EO in the first figure is a valid mood.

(2) Consider the mood I(*ab*) implies I(*ba*), or, in our abbreviated notation, II in the second figure. I(*ab*) is represented by



and I (ba) is represented by



These two modes of representation are identical, except that the diagrams do not appear in the same order. But, since the order in which the diagrams appear is irrelevant, it is intuitively clear that the mood is a valid one. If we had chosen to consider the mood AA in the second figure, it would have appeared at once that not all of the possibilities

contained in the antecedent are contained as well in the consequent, and the empirical invalidity of the mood would have been manifest at once.

In general, if the antecedent is of the *same form* as the consequent and the mood is valid in the second figure, then the antecedent (or, indifferently, the consequent) is said to be a **convertible** form. The operation of **simple conversion** consists in the interchange of subject and predicate and the proposition in question is said to be **simply convertible.** The student will discover that this operation is permissible in the case of E and I, but not in the case of A and O.

(3) Consider the mood, I(*ab*) implies A(*ab*). It is clear that if the terms are such as to realize either the third or the fourth possibility (Fig. 7), then I(*ab*) is true and A(*ab*) is false. Accordingly, the mood is invalid.

DEDUCTION OF THE VALID MOODS

This case leads us to make again the important observation: Since true means *necessarily true* and untrue means *not necessarily true,* it is enough to point to one diagrammatic representation of the antecedent which at the same time is not a diagrammatic representation of the consequent, in order to become aware of the invalidity of the mood. It is said of certain treatises of the Hindus on geometry, that the master, instead of offering a proof of the

separate theorems, was content, after stating the proposition, to draw the figure and write under it a word like *ecce*. The pupil was thus expected to gather intuitively the abstract or general truth from the observation of a single illustration. The student is well aware that the ideal of the Greek geometers was to deduce the theorems of the science from the fewest possible number of initial assumptions. Whether this ideal be a mistaken one or not, it has at least inspired the procedure of all science down to the present day. If we were to apply this historical contrast of the Greek and the Hindu geometers to ourselves, we might say that up to now our study of logic has been carried out on the Indian plan. Up to now we have been Hindu logicians, for we have been content merely to write *ecce* underneath our diagrams—a sort of Cartesian test, an application of the *clare et distincte percipio*. But from this moment forth we shall fashion our doctrine after the Helladian model. We shall deduce all the true and all the untrue variants of immediate inference by the aid of certain principles from the fewest possible number of initial postulates.

Definition.—Two propositions that cannot both be true and cannot both be false are said to be **contradictory.** By the postulates of the preceding chapter it follows that A(*ab*) and O(*ab*) and that E(*ab*) and I(*ab*) are contradictory pairs.

Principle I.—If in any valid mood antecedent and consequent be interchanged and each be replaced by its contradictory, a valid mood will result.

Postulate 1.—A(ab) implies A(ab),
Postulate 2.—A(ab) implies I(ab),
Postulate 3.—I(ab) implies I(ba),
Theorem 1.—O(ab) implies O(ab),
(from Postulate 1, by Principle I),
Theorem 2.—E(ab) implies O(ab),
(from Postulate 2, by Principle I),
Theorem 3.—E(ba) implies E(ab),
(from Postulate 3, by Principle I).

These are as many results as can be gotten from our assumptions. We therefore proceed with the introduction of an additional principle and with a definition which will make its application possible.

Definition.—If x implies y is a valid implication. then x is said to be a **strengthened** form of y and y is said to be a **weakened** form of x.

This definition of the meaning of strengthening and weakening is not to be taken in the traditional way, but in a more general sense. If it happens to be true, for example, that y implies x in addition to the fact that x implies y, then y will not only strengthen to x, but will also weaken to x. Thus, by postulate 3, I(ab) weakens to I(ba) and I(ba) strengthens to I(ab). But since postulate

3 can also be written I(*ba*) implies I(*ab*), this latter expression being only another way of writing II in the second figure, it follows that I(*ba*) is also a strengthened form of I(*ab*) and that I(*ab*) is also a weakened form I(*ab*). Again A(*ab*) weakens to I(*ab*) and I(*ab*) strengthens to A(*ab*) by postulate 2. In applying the principle about to be given, it must be noticed that the theorems just established give us the right to strengthen or to weaken in the same sense as do the postulates.

Principle II.—If in any valid mood the antecedent be strengthened or the consequent be weakened, a valid mood will result.

Theorem 4.—A(*ab*) implies I(*ba*),
(for Postulate 3 gives us the right to weaken the consequent of Postulate 2).

Theorem 5.—E(*ba*) implies O(*ab*),
(for Theorem 3 gives us the right to strengthen the antecedent of Theorem 2).

Theorem 6.—I(*ab*) implies I(*ab*),
(for Postulate 3 may be written in either of two ways, as explained above. Accordingly, Postulate 3 gives us the right to strengthen its own antecedent or to weaken its own consequent).

Theorem 7.—E(*ab*) implies E(*ab*),
(for, similarly, Theorem 3 gives us the right

to strengthen its own antecedent or to weaken its own consequent. Or we might have arrived at the same result by applying Principle I to Theorem 6).

DEDUCTION OF THE INVALID MOODS

We have, accordingly, by postulating the validity of three of the moods of immediate inference deduced the remaining seven by the aid of two principles. These two, as well as the two which are given below, will have to be assumed later on in any case, but in a more general form. The deduction of the invalid moods is felt as an exercise for the student. Since it will be necessary to postulate four of these moods as invalid, he will have eighteen theorems to deduce. The postulates and the principles of deduction are given below. It is only necessary to add that the additional results of theorems 4-7 (above) must be kept in mind when he comes to apply Principle IV (below).

Postulate 4.—A (ab) does not imply A (ba),
Postulate 5.—A (ab) does not imply O (ba),
Postulate 6.—A (ab) does not imply O (ab),
Postulate 7.—E (ab) does not imply I (ab).

Principle III.—If in any invalid mood antecedent and consequent be interchanged and each be re-

placed by its contradictory, an invalid mood will result.

Principle IV.—If in any invalid mood the antecedent be weakened or the consequent be strengthened, an invalid mood will result.

Theorems.—The other (18) invalid moods.

Exercises

1. The process by which we infer I from A or O from E in the second figure, is called *conversion by limitation* or *per accidens*. Cast the following into categorical form and convert by limitation:

"A favorite has no friend."

2. When the terms of a proposition are simply converted, the resulting proposition is called the *converse* and the original proposition is called the *convertend*. What is the converse of the following:

"No man e'er felt the halter draw,
With good opinion of the law."

3. Immediate inference by *privative conception* consists in passing from an affirmative to a negative equivalent to it, or *vice versa*. Thus, "all metals are elements" is the same as "no metals are compounds"; "some elements are not metals" is the same as "some elements are non-metals." Effect this transformation in the statements of Exercises 1, 2, 4, and 5.
4. Conversion by *contraposition* consists in replacing the terms by their negatives and interchanging them. It is not permissible in the case of E and I. Convert by contraposition:

"All that glisters is not gold."

5. Transform the following by privative conception and convert the result by contraposition and by limitation:

"No man can eat his cake and have it, too."

CHAPTER VIII

THE RULES OF IMMEDIATE INFERENCE

It is the custom of the traditional logic to formulate certain rules by whose aid the invalid moods of immediate inference may be detected immediately. These rules all turn upon the meaning of a *distributed* term. We begin, therefore, with an explanation of the sense of this conception, giving the definition at the outset and setting forth its application in the sequel.

DISTRIBUTED TERMS

Definition I.—Distributed terms are those modified, either implicitly or explicitly, by the quantitative adjectives "all" or "no." All others terms are **undistributed.**

In the first place, it is to be noticed that before the predicate of A and the predicate of I, the word "some" is unexpressed but understood. When we assert "all *a* is *b*," we mean: "all *a* is some (it may be all) *b*"; and the same remark holds of I. This fact may be more easily seen to hold of I, if we appeal to the property of simple convertibility of this form. When "some *a* is *b*" is written equivalently, "some *b* is *a*," the quantitative adjective

which is implicit before the predicate in the first case becomes explicit before the subject in the second case. The predicate of A and the predicate of I are, therefore, according to our definition, undistributed terms. It is equally clear that the subject of A is distributed, since it is modified by "all," and that the subject of I is undistributed, since it is modified by "some."

That the subject of E, "no *a* is *b*," is distributed, is at once apparent from our definition. But the distributed character of the predicate will be manifest as well, if we appeal to the property of the simple convertibility of E, established in the last chapter. Thus, "no *a* is *b*" being logically equivalent to "no *b* is *a*," the quantity of the predicate-term becomes explicit when it is made the subject. The same result would appear in another way if we were to assume the right to change E into A by privative conception, expressing it in the form "all *a* is non-*b*," and then in the form, "all *b* is non-*a*," the terms being then explicitly modified by the adjective "all." Accordingly, E distributes both its subject and its predicate by definition.

As regards the O-form, "some *a* is not *b*," it is apparent at once that the subject is an undistributed term, for it is modified by "some" and not by "all." But it is not so easy to see that the predicate is distributed. In order to become aware of this fact, imagine the part "some *a*" to represent

a fixed part of the *a* class. We may then imagine the contradictory of this part and designate it by the phrase, "non-some *a*." This part will constitute everything that is not "some *a*." The student will then be able, perhaps by the aid of a diagram which he may construct for himself, to understand that "some *a* is not *b*" is exactly rendered by the phrase, "all *b* is non-some *a*." The meaning which was implicit before the predicate in the first form has become explicit before the same term appearing as the subject in the new but equivalent expression. We conclude, then, that O distributes its predicate, but does not distribute its subject. These results appear in the following scheme, the distributed terms being printed in black letter:

A(***a*** *b*)	E(***a*** ***b***)
I(*a* *b*)	O(*a* ***b***)

We shall now state the first rule for the immediate detection of the invalid moods of immediate inference and we shall only introduce additional ones when it shall have been shown that this one is not in itself sufficient to effect our purpose.

Rule 1.—A form in which a given term appears undistributed does not imply a form in which that same term appears distributed.

Consider the mood A (*ab*) implies A (*ba*), or, in our abbreviated notation, AA in the second figure. The predicate of the antecedent is an undistributed term, but it appears distributed as the subject of the consequent. The mood is, consequently, declared invalid by the first rule. Again, in the mood AE in the first figure the subject term is distributed in both antecedent and consequent, but the predicate of the antecedent is distributed in the consequent. The mood is therefore declared invalid by the rule.

The student would now do well to construct the array of immediate inference for himself and to determine precisely just which moods in each figure come under the rule in question. He will find that some moods remain whose invalidity is not declared. We proceed, accordingly, to formulate two additional rules, which will prove exactly enough to effect our purpose. These will have to be preceded by definitions which will render them applicable.

AFFIRMATIVE FORMS AND NEGATIVE FORMS

Definition 2.—A form whose predicate is undistributed is called an **affirmative** form. By results already established it follows that A and I are affirmative. This definition will very possibly bewilder the student upon first consideration, for he will miss the motive which prompts it. He will rather have expected us to define an affirmative form

by means of a *synonyme,* after the fashion of the dictionary. Instead of that we have followed a procedure which is usual in science; we have selected a *property* which is characteristic of affirmative forms, but which does not characterize the others, and we have used this property in order to define them. Our next definition is:

Definition 3.—A form which distributes its predicate is called a **negative** form. By results already established it follows that E and O are negative forms. The two rules which remain to be stated are:

Rule 2.—An affirmative form does not imply a negative form.

Rule 3.—A negative form does not imply an affirmative form.

These three rules will be found *sufficient* for the purpose in hand, for it will be discovered that by means of them all the moods previously found to be invalid are declared untrue. That they are also *necessary*—that is, that no one of them can be dispensed with—will appear at once from the following consideration: Suppose that an invalid mood has been found that is declared invalid by the first rule and by no other rule. It is clear that this rule could not then be omitted from our list; and the same remark applies to the other two. The three rules are all necessary because we can point to at least one example which falls uniquely under each rule.

COROLLARY TO THE RULES

In addition to the rules there is a corollary which follows upon their assumption, and whose application depends upon the following:

Definition 4.—A form which distributes its subject is said to be **universal**. By results already established A and E are universal forms.

Definition 5.—A form which does not distribute its subject is said to be **particular.** By results already established I and O are particular forms. The facts that have now been made matters of definition are conveniently remembered by means of the mnemonic scheme which is given below, the distributed terms being printed in black letter.

	Affirmative	Negative
Universal	A (***a*** *b*)	E (***a*** ***b***)
Particular	I (*a* *b*)	O (*a* ***b***)

Corollary.—A particular form does not imply a universal form.

This theorem will be proven by showing that every one of the moods in question are declared invalid by one or more of the rules. Thus, OA in both figures is thrown out by the third rule and IE, IA and OE in both figures by the first rule.

RULES OF IMMEDIATE INFERENCE

A generalization which is based upon an examination of specific instances is said to be arrived at by **induction.** If the instances examined are all the instances that there are, as in the case of our three rules and the corollary, it is said to be **complete,** and the general truth arrived at is said to be based upon a **perfect** induction.

Exercises

1. Is the proof of the binomial theorem in ordinary algebra based upon a complete induction?
2. Does a generalization founded upon a single instance possess any degree of probability? Compare in this connection the following arguments:

   This box contains a dozen buttons; therefore, every box contains a dozen buttons.
   This solar system has eight planets; a fact that may well be true of every solar system.
   I am aware of the existence of my own mind by direct introspection; other men's behavior is apparently purposive and rational and like my own; therefore, other men, too, have minds.

3. Construct the array of immediate inference and place after each invalid mood the number of a rule or corollary that declares it to be invalid.
4. Prove that there is only one invalid mood which illustrates the second rule uniquely.
5. Make a list of examples which fall uniquely under the first and under the third rule.
6. Why is it that there is no unique illustration of the corollary?

SYLLOGISM

CHAPTER IX

MOODS AND FIGURES OF THE SYLLOGISM

We have now to study an array of a somewhat more general character than the one of immediate inference, and we may begin, not by describing it in the abstract, but by directing attention to a few specific examples. Consider the proposition:

$$\mathrm{A}(ba) \text{ and } \mathrm{A}(cb) \text{ implies } \mathrm{A}(ca),$$

and suppose that it is our desire to represent the antecedent as a whole. The diagrams below will evidently exhaust all the modes of representation that are possible.

either 
or 
or 
or 
It will be observed that each one of the four ways of representing the antecedent is at the same time a

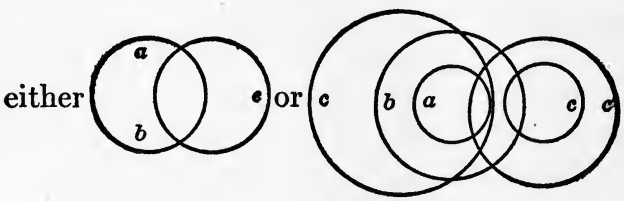
way of representing the consequent. Accordingly, if *a*, *b* and *c* are related as in the antecedent, then it follows that *a* and *c* are related as in the consequent, so that the original proposition is a valid implication.

RULE FOR CONSTRUCTING THE DIAGRAMS

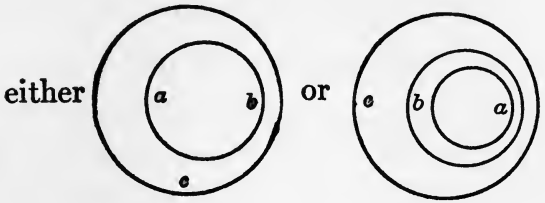
The rule for constructing the diagrams which will represent the antecedent as a whole, is this: if the second form in the antecedent has (say) three modes of representation, then represent the first form completely three times (on three separate lines) and add to the first line the first way of representing the second form in the antecedent, to the second line the second way and to the third line the third way. The antecedent will then be completely represented as a whole. For example, consider the implication:

$$\mathrm{A}(ab) \text{ and } \mathrm{O}(cb) \text{ implies } \mathrm{O}(ca).$$

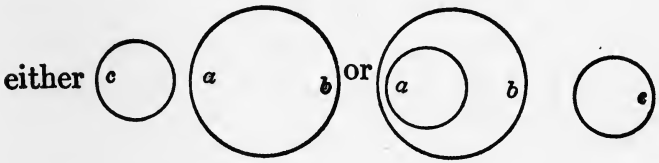
Since $\mathrm{O}(cb)$ is represented in three ways (see Chap. VI, Fig. 7), we represent $\mathrm{A}(ab)$ completely three times. Now supply to the first line the first way of representing $\mathrm{O}(cb)$, that is,



and to the second line the second way of representing O(*cb*),



and, finally, to the third line the third way of representing O(*cb*),



It will be perceived at once that each separate manner of denoting *a*, *b* and *c*, as related in the antecedent, is also a manner of denoting *a* and *c* as related in the consequent. It is intuitively evident, then, as in the last illustration, that the implication is validly drawn. It will be necessary, perhaps, for the student to examine closely the more complicated diagram which appears in the first line, in order to satisfy himself that, together with the others, it exhausts all the possibilities there are.

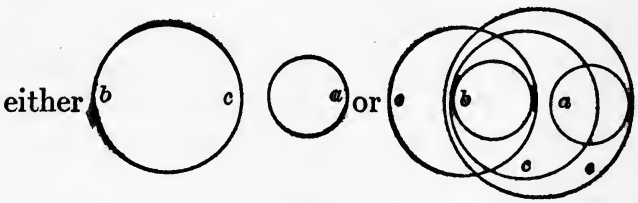
INVALIDITY DETERMINED BY DIAGRAM

Since we have understood *untrue* to mean not necessarily true, it is clear that in order to perceive the invalidity of any proposition of the form under consideration it will be enough to point to a single representation of the antecedent which at the same time is not a representation of the consequent. When such a case is at hand, we are at once made aware of the implication's untruth.

Let us consider, then, a further case:

$$\mathrm{E}(ab) \text{ and } \mathrm{A}(bc) \text{ implies } \mathrm{E}(ca).$$

The complete expression of the antecedent is:



But in the last diagram we have two separate instances of the untruth of $\mathrm{E}(ca)$. Consequently, the implication is invalid.

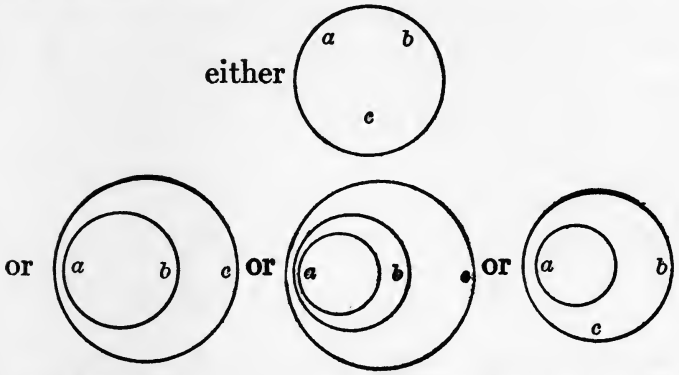
The first example which we examined above was,

$$\mathrm{A}(ba) \text{ and } \mathrm{A}(cb) \text{ implies } \mathrm{A}(ca).$$

Consider now the following variation:

$$\mathrm{A}(ab) \text{ and } \mathrm{A}(bc) \text{ implies } \mathrm{A}(ca),$$

and observe that the two cases differ in regard to their term-order. The complete representation of the antecedent is:



and three distinct instances will be observed in these diagrams of the untruth of the consequent, so that the implication is invalid. It is to be remarked, then, that the validity of an implication of the type under consideration depends not only upon the particular categorical forms which enter into it, but also upon the particular manner in which the terms are arranged.

DETERMINATION OF FIGURE

We shall now determine all the possible ways of arranging the terms. These will evidently be not more than eight in number, *viz.*,

ba	*ab*	*ba*	*ab*
cb	*cb*	*bc*	*bc*
ca	*ca*	*ca*	*ca*

ba	*ab*	*ba*	*ab*
cb	*cb*	*bc*	*bc*
ac	*ac*	*ac*	*ac*

It is clear that the two forms conjoined in the antecedent may be written in either order that we choose. In technical language this fact would be expressed by saying that the conjunctive relation of logic is commutative. We may then, if we wish, always write a specific one of the two first. *We agree as a matter of convention, always to write first the form which contains the predicate of the consequent.* Thus, we write

A(*ba*) and A(*cb*) implies A(*ca*),
rather than A(*cb*) and A(*ba*) implies A(*ca*).

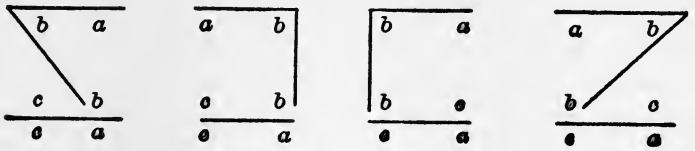
To accord with this convention, the second set above will have to be rearranged, thus:

cb	*cb*	*bc*	*bc*
ba	*ab*	*ba*	*ab*
ac	*ac*	*ac*	*ac*

We shall now show that the term-arrangements in this set are only a repetition of those in the first set above, but in a different order, so that it will turn out that there are only four distinct ways of arranging the terms.

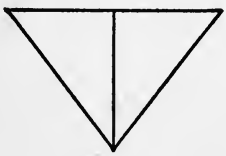
Suppose that we were to draw two lines, one connecting the terms in the categorical form written first in the antecedent and another connecting the

term which does not appear in the consequent. Then the first four varieties of term-order will appear thus:



and the second set will present the same varieties of figure, but with the first and last case reversed. The figures

will in each instance give a very clear geometrical image of the number of possible term-orders. The student will do well to commit to memory at once the four variations of the first set, which we shall constantly refer to as figures 1, 2, 3, and 4, respectively. The four figures are easily remembered as combined in an isosceles triangle standing on its vertex (see below).

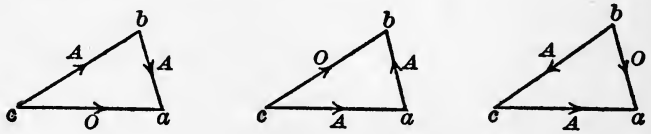


OTHER DIAGRAMMATIC METHODS OF DETERMINING FIGURE

While this method of determining the term-order will prove quite sufficient for all purposes, it is by no means the only device that might be constructed. Form a triangle with the term *a* at the end of the base to the right, the term *c* at the left, and the term *b* at the vertex above. Let an arrow indicate the direction of "flow" from subject to predicate, or, the order subject-predicate. Then if we choose

A(*ba*) and A(*cb*) implies O(*ca*),
A(*ab*) and O(*cb*) implies A(*ca*),
O(*ba*) and A(*bc*) implies A(*ca*),

these three propositions, whose invalidity the student may confirm for himself, would be represented by the diagrams given below:



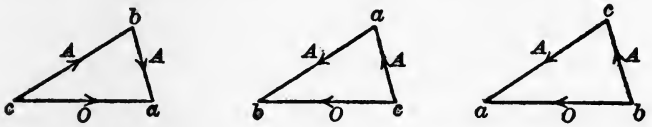
In the sequel the student will have to accustom himself to cases which do not at first appear to belong to any one of the conventional figures. Consider the three term-orders:

ba	*ab*	*ca*
cb	*ca*	*bc*
ca	*cb*	*ba*

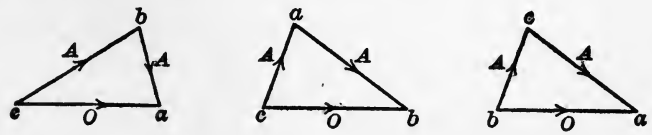
By following the original directions for determining the figure, it will be easy to recognize these as all variations of the first case. If we were to write these out, say in the form:

A(*ba*) and A(*cb*) implies O(*ca*),
A(*ab*) and A(*ca*) implies O(*cb*),
A(*ca*) and A(*bc*) implies O(*ba*),

these three equivalent statements would be represented by means of our triangles as follows:

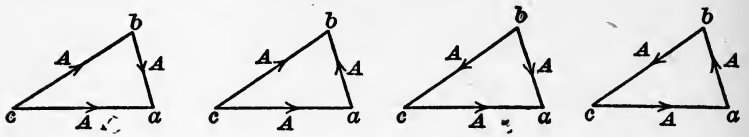


It will be noticed that in each instance the direction of "flow" as indicated by the arrows is continuous and in one direction from the subject of O to the predicate of O. The formal identity of the three cases will appear more clearly if the second and third figures be taken out of the plane of the page and turned over, thus:



Suppose, finally, that we should wish to represent by means of the triangles a single combination of

letters (AAA say) in each one of the four figures. Our diagrams would then appear as follows:



PARTS OF THE SYLLOGISM

We proceed now to summarize these results and to define a certain number of technical terms. If we imagine that the A's below may be replaced in any way by any one of the other letters, E, I, O, then the **syllogism** is a form of implication belonging to one of the following types:

1. A(ba) and A(cb) implies A(ca),
2. A(ab) and A(cb) implies A(ca),
3. A(ba) and A(bc) implies A(ca),
4. A(ab) and A(bc) implies A(ca).

These differences are known as the first, second, third, and fourth **figures** of the syllogism, respectively. The two forms conjoined in the antecedent are called the **premises** and the consequent is called the **conclusion.** The predicate of the conclusion is called the **major term** and points out the **major premise,** which by convention is written first in the antecedent. The subject of the conclusion is called the **minor term** and points out the **minor premise,** which by convention is written second in the antecedent. The term which is common to the premises

and which does not appear in the conclusion is called the **middle term.**

ARRAY OF THE SYLLOGISM

There will evidently be sixty-four syllogistic variations, obtained by taking the permutations of the four letters, A, E, I, O, three at a time. Each one of these may be expressed in each one of the four figures, so that we shall have two hundred and fifty-six cases in all to consider. These are known as the **moods** of the array of the syllogism. True propositions of the array are known as **valid moods** of the array. The remainder are known as **invalid moods** of the array.

In representing the array of the syllogism it will prove convenient, as in the case of immediate inference, to omit the word *and* and the word *implies,* as well as the parts (a, b), (b, c), (c, a) and to exhibit each mood as a simple combination of the three letters. In constructing the array, the best method to employ will be to add to each one of the sixteen permutations of the four letters, A, E, I, O, taken two at a time, each one of the four letters in succession. The array under each figure will then appear thus:

AAA	EAA	IAA	OAA
E	E	E	E
I	I	I	I
O	O	O	O

AEA	EEA	IEA	OEA
E	E	E	E
I	I	I	I
O	O	O	O
AIA	EIA	IIA	OIA
E	E	E	E
I	I	I	I
O	O	O	O
AOA	EOA	IOA	OOA
E	E	E	E
I	I	I	I
O	O	O	O

The student should now construct the array for himself and examine a great number of the moods in each one of the four figures, in order to determine the validity or invalidity of each one, by the method of inspection explained at the beginning of this chapter. We remark that six true propositions will be found under each figure, but in different positions in the array.

We shall assume now that the student has made a list of the valid moods of the syllogism, having applied the method of inspection to the two hundred and fifty-six possible cases. In order that he may verify his results, the six that are valid under each figure are set down below:

1.	2.	3.	4.
A A A	A E E	A A I	A A I
A A I	A E O	A I I	A E E
A I I	A O O	E A O	A E O
E A E	E A E	E I O	E A O
E A O	E A O	I A I	E I O
E I O	E I O	O A O	I A I

THE MNEMONIC LINES

The valid moods of the Aristotelian syllogism are conveniently remembered by means of the following mnemonic lines, the vowels in each separate word standing for the mood in question,

> *Barbara, Celarent, Darii, Ferio*que prioris;
> *Cesare, Camestres, Festino, Baroko,* secundæ;
> Tertia, *Darapti, Disamis, Datisi, Felapton,*
> *Bokardo, Ferison,* habet; quarta insuper addit
> *Bramantip, Camenes, Dimaris, Fesapo,*
> *Fresison.*

This mnemonic first appears in the *Summulæ Logicales* of Petrus Hispanus, who was afterward Pope John XXI, but without the line which records the fourth figure. He does not, however, profess to be the author of it. Several other versions are found in later writers. A Greek mnemonic of the same kind is inserted in early editions of the *Organon* of Aristotle. The moods not listed are

gotten by weakening the universal conclusions where they occur, to particular conclusions. Jevons remarks: "This device, however ingenious, is of a barbarous and wholly unscientific character; but a knowledge of its construction and use is still expected from the student of logic, and the verses are therefore given and explained." What Jevons overlooks is the fact, to be explained immediately, that this is really a first crude attempt at a deduction of the moods and, consequently, a matter of historical interest.

Besides the vowels in each word which stand for the mood in question, the initial consonants, as well as *m, p, s,* and *k,* have each a special significance. Thus, *s* means: convert simply in the preceding premise or conclusion. The letter *p* requires a conversion *per accidens* and *m* indicates an interchange of premises. By performing the indicated operations a mood in the second, third, or fourth figure will be reduced to the first, the initial consonant indicating to which mood of the first figure the reduction will be effected. Two illustrations will suffice to indicate the method.

(1) The mood *Cesare* is E A E in the second figure, or

$$\mathrm{E}(ab) \text{ and } \mathrm{A}(cb) \text{ implies } \mathrm{E}(ca).$$

Here only one change is indicated, that of simple

conversion in the major, the letter *s* following the first vowel. There results, evidently,

$$\mathrm{E}(ba) \text{ and } \mathrm{A}(cb) \text{ implies } \mathrm{E}(ca),$$

and this is the mood *Celarent* recorded in the first line.

(2) The mood *Bramantip* is A A I in the fourth figure, or

$$\mathrm{A}(ab) \text{ and } \mathrm{A}(bc) \text{ impress } \mathrm{I}(ca).$$

Converting the conclusion *per accidens,* which is required by the letter *p,* we get $\mathrm{A}(ac)$, and transposing the premises, as indicated by the letter *m,* the mood becomes

$$\mathrm{A}(bc) \text{ and } \mathrm{A}(ab) \text{ implies } \mathrm{A}(ac).$$

The student will have no difficulty, if he resorts to the method of triangular representation already explained, in recognizing this as A A A in the first figure, the mood recorded as *Barbara* in the first line of the mnemonic verse.

REDUCTIO AD IMPOSSIBILE

The moods *Baroko* and *Bokardo* require a special treatment known as indirect reduction, or *reductio ad impossibile,* and indicated by the letter *k*. In the old logic the premises were taken to be true by

presumption. Consider, now, the mood *Baroko* and suppose the conclusion does not follow from the premises. If O(*ca*) is false, then A(*ca*) is true. Combine this latter form with the major premise and we have

A(*ab*) and A(*ca*) implies A(*cb*),

a mood in *Barbara* whose conclusion contradicts the minor of *Baroko*. Our supposition, then, that the conclusion of *Baroko* does not follow, turns out to be impossible, and the proof depends upon the validity of *Barbara*.

INDIRECT REDUCTION BY OTHER PROCESSES

Indirect reduction may also be effected by other processes, either by attaching the negative particle to the predicate term, or else by the process of conversion by contraposition (see the exercises at the end of Chapter VII and the account of negative terms in Chapter II). Thus, converting the major of *Baroko* by contraposition and attaching the negative particle in minor and conclusion to the predicate term, we have

All *non-b* is *non-a*,
Some *c* is *non-b*,
Some *c* is *non-a*.

If *non-a* and *non-b* be represented by *a′* and *b′*, respectively, this becomes

$$A(b'\ a') \text{ and } I(cb') \text{ implies } I(ca')$$

which will be readily recognized as A I I in the first figure, a mood recorded in the first line of the mnemonic verses as *Darii*.

A similar process may be applied to *Bokardo* as follows: Attach the negative particle to the predicate terms and we should have:

$$I(ba') \text{ and } A(bc) \text{ implies } I(ca').$$

This is the mood *Disamis,* which reduces to *Darii* in the usual way by following out the operations indicated by the letters.

Other moods besides *Baroko* and *Bokardo* are susceptible to this method of indirect reduction. Thus, *Camenes,*

$$A(ab) \text{ and } E(bc) \text{ implies } E(ca),$$

reduces to *Barbara,* if we employ the two operations of conversion by contraposition and by negation—that is,

$$A(b'\ a') \text{ and } A(cb') \text{ implies } A(ca'),$$

and the mood, *Ferison*—that is,

$$E(ba) \text{ and } I(bc) \text{ implies } O(ca),$$

reduces to *Darii,* when we have converted simply in the minor premise—that is,

$$A(ba') \text{ and } I(cb) \text{ implies } I(ca').$$

Exercises

1. Would any of the geometrical images employed in the determination of figure be changed for *Alice Through the Looking Glass?*
2. Reduce the moods of the other figures to those of the first, following the operations indicated in the mnemonic verses.
3. By indirect reduction change *Camestres* to *Barbara, Felapton* to *Darapti,* and *Fresison* to *Datisi.*
4. Reduce *Bokardo* by the method of *reductio ad impossibile.*
5. Remembering that contraries cannot both be true, reduce *Camestres* by the method of the last example.
6. If (*a b c*) is taken in cyclical order—that is, read *ab, bc, ca*—will any other figures result on permuting the three letters?
7. If *ab, bc, ca* stands for the fourth figure, what will be the effect of permuting these pairs in every possible way, regard being had to the proper order of the premises.

CHAPTER X

DEDUCTION OF THE SYLLOGISTIC MOODS

We shall now, as in the case of immediate inference, by postulating the truth of the smallest possible number of the valid moods of the syllogism. deduce the remainder by the aid of two principles. The assumptions which we shall have to make, are as follows:

Postulate 1.—A(*ba*) and A(*cb*) implies A(*ca*),

Postulate 2.—E(*ba*) and A(*cb*) implies E(*ca*),

Principle I.—If in any valid mood either premise and the conclusion be interchanged and each be replaced by its contradictory, another valid mood will result.

Principle II.—If in any valid mood a premise be strengthened or the conclusion be weakened, another valid mood will result.

Theorems.—The remaining (22) valid moods.

EXAMPLES OF DEDUCTION

When the student has carefully studied the examples which are set down below, he should be able to carry out the entire deduction without further aid and the work of doing this should have been

completed before reading the remainder of the chapter.

(1) Suppose that we were to combine the first postulate and the first principle. Interchanging minor premise and conclusion and replacing each by its contradictory we obtain

A(*ba*) and O(*ca*) implies O(*cb*).

Here the major term is *b*, so that the premises are in the normal order, the minor term is *c* and the middle term has become *a*. The figure is now determined in one of the ways already described, *viz.*,

b *a*
c *a*
c *b*

so that if our first theorem, AOO in the second figure, be written according to the original convention, our result becomes

Theorem 1.—A(*ab*) and O(*cb*) implies O(*ca*).

Similarly, by contradicting the major premise and the conclusion and replacing each by its contradictory, we should have obtained OAO in the third figure and this mood, if we employ the original convention of the third figure, becomes

Theorem 2.—O(*ba*) and A(*bc*) implies O(*ca*)

(2) The mood AOO in the second figure being now established as valid, we may apply to it either one of the principles in the same sense as to the

postulates. Let us begin by writing the mood with the terms ordered as in the original convention and, applying Principle II, let us strengthen the minor premise O(*cb*) to E(*bc*). This will be possible by applying a result of immediate inference already established, *viz.*,

$$E(bc) \text{ implies } O(cb).$$

Accordingly, our next result becomes

Theorem 3.—A(*ab*) and E(*bc*) implies O(*ca*), or, AEO in the fourth figure is a valid mood.

(3) Suppose that we were to return now to the first principle and apply it to the result which has just been obtained. Contradicting major and conclusion and interchanging, we obtain immediately

$$A(ca) \text{ and } E(bc) \text{ implies } O(ab).$$

It is important that the student should not fail to observe that the premises are no longer in the normal order and that the normal order must be restored before the figure can be ascertained. Failure to make this change might result, as he will readily see, not only in a mistake in the figure but also in the mood. Our result is, accordingly, EAO in the fourth figure, or, if the terms be ordered as in the original convention,

Theorem 4.—E(*ab*) and A(*bc*) implies O(*ca*).

Had we chosen to contradict and interchange

minor and conclusion of AEO in the fourth figure, we should have obtained in the same way

Theorem 5.—A(ab) and A(bc) implies I(ca). Or A A I in the fourth figure is a valid mood.

It will now be observed that the application of Principle I to any mood in the fourth figure places the premises out of the normal order, but leaves the figure unchanged. Employing a more technical language, we should say that the fourth figure is invariant under Principle I.

Having deduced the twenty-two theorems, the student should set himself the exercise of deriving the valid moods under each figure separately, and he should try to arrive at each result by the fewest possible number of steps. In deducing those under the fourth figure, it will economize steps and so add to the elegance of his demonstration, if he will keep in mind the rule stated in the last paragraph. The following rules, which the student will do well to verify for himself, show the effect on mood and figure of contradicting and interchanging either premise and the conclusion.

Rules of Contradiction and Interchange

Contradicting and interchanging major and conclusion, we should have:

(1) The first figure changes to the third and conversely, and the premises remain in normal order;

(2) The second figure changes to the third with the normal order of the premises reversed;

(3) The fourth figure remains invariant with the normal order of the premises reversed.

Contradicting and interchanging minor and conclusion we should have:

(1) The first figure changes to the second and conversely, and the premises remain in normal order;

(2) The third figure changes to the second, with the normal order of the premises reversed;

(3) The fourth figure remains invariant, with the normal order of the premises reversed.

It will also be found advantageous to state in the form of rules the effect of simple conversion in either premise or in the conclusion.

Rules of Simple Conversion

(1) Simple conversion in the major premise changes the first figure to the second and conversely, the third figure to the fourth and conversely.

(2) Simple conversion in the minor premise changes the first figure to the third and conversely, the second figure to the fourth and conversely.

(3) Simple conversion in the conclusion changes the first figure to the fourth and conversely and the second and third figures remain invariant.

DEDUCTION OF THE INVALID MOODS

It remains in order to complete the solution of the syllogism, to deduce all of the two hundred and thirty-two invalid variants from the fewest possible number of initial assumptions. The most elegant way to proceed will be to begin with a single postulate and a single principle and to introduce further assumptions only when we are compelled to do so. We state, accordingly,

Postulate 3.—E(*ba*) and E(*cb*) does not imply I(*ca*),

Principle III.—If in any invalid mood a premise be weakened or the conclusion be strengthened, another invalid mood will result.

Let us begin by weakening the major to E(*ab*), since E(*ba*) implies E(*ab*); and secondly, by weakening the minor to E(*bc*). Finally, let us weaken the premises to E(*ab*) and E(*bc*) respectively. We shall then have established by postulate and theorem the invalidity of EEI in all four figures. If, now, the E- premises be weakened to O-premises and the I- conclusion be strengthened to an A- conclusion in every possible way, the untruth of

E E I	E O I	O E I	O O I
E E A	E O A	O E A	O O A

will have been established in each one of the four figures. The invalidity of thirty-one moods has, accordingly, been made to depend upon the invalid-

ity of E E I in the first figure alone. It should be noted in this connection that the application of Principle IV (below) to any mood in this set of thirty-two will yield no mood that is not already contained in the set and that Postulate 4 (below) will yield no mood of the set by either principle. We now introduce the second postulate and the second principle.

Postulate 4.—A(*ab*) and A(*cb*) does not imply I(*ca*).

Principle IV.—If in any invalid mood either premise and the conclusion be interchanged and each be replaced by its contradictory, another invalid mood will result.

The application of this principle will offer no difficulty that has not been already overcome, and no doubt the practice which the student has had in the derivation of the valid moods, will enable him to dispense with further illustrations here. Thus we should obtain at once the theorems:

a. A A A (second figure) by 4, iii,
b. A E O (first and third figs.) by 4, iv,
c. A E E (first and third figs.) by b, iii,
d. A I I (second and fourth figs.) by c, iv,
e. I A I (first and second figs.) by d, iii,
f. E A E (third and fourth figs.) by e, iv.

Other moods which follow from this postulate

and whose invalidity may be easily established in all four figures are:

E I E I E E I E O I I I I I A

and of this set of theorems it can be said that each one is independent of the original set of thirty-two.

In order to deduce the invalid moods that remain, it will be necessary to assume five other postulates, of whose independence the student will be able to satisfy himself by considerations similar to those set forth above. These are:

A A O (first fig.)
A A O (fourth fig.)
O A O (first fig.)
A A A (fourth fig.)
E E O (first fig.)

THE RULES OF SYLLOGISM

It was a part of the traditional treatment of the syllogism to formulate certain rules for the immediate detection of the invalid moods. We shall state these and we shall then prove that they are necessary and sufficient for the purpose which they effect.

Rule 1.—Two negative premises do not imply a conclusion.

Rule 2.—Two affirmative premises do not imply a negative conclusion.

Rule 3.—An affirmative premise and a negative premise do not imply an affirmative conclusion.

Rule 4.—Two premises in neither of which the middle term is distributed do not imply a conclusion.

Rule 5.—Two premises in which a given term occurs undistributed, do not imply a conclusion in which that same term occurs distributed.

These rules are *sufficient,* for they declare invalid all moods already recognized as invalid. They are all *necessary,* for we can point to at least one example that falls uniquely under each rule. In seeking unique illustrations of each rule, the student will do well to write out in full the mood to be examined and to underline the distributed terms.

Exercises

1. Beginning each time with *Barbara* and *Celarent,* deduce the valid moods of the second, third, and fourth figures.
2. From A A A (fourth fig.) deduce twenty-six other invalid moods of the syllogism.
3. Construct the array of the syllogism and place after each invalid mood the number of a rule that declares it to be invalid.
4. Make a list of examples that fall uniquely under each one of the five rules.
5. Prove that there can be only one invalid mood that will illustrate the second rule uniquely.
6. Show that, as the result of a complete induction of all of the moods in question, it follows from the rules as a corollary that two particular premises do not imply a conclusion.
7. Show similarly, that it follows from the rules that a universal premise and a particular premise do not imply a universal conclusion.

8. Prove that all moods of the first figure are invalid, wherein the minor is not affirmative or the major is not universal.
9. Prove that all moods of the second figure are invalid, wherein the major is not universal or both premises affirmative.
10. Prove that all moods of the third figure are invalid, wherein the minor is not affirmative or the conclusion is not particular.
11. Establish the following rules of the fourth figure:

    If the major is affirmative, the minor must be universal.
    If the minor is affirmative, the conclusion must be particular.
    Neither premise can be a particular negative nor can the conclusion be a universal affirmative.
    If one premise be negative, the major must be universal.

CHAPTER XI

THE HYPOTHETICAL SYLLOGISM

The forms of implication to which I shall now invite the attention of the reader are generally known as **conditional arguments.** They possess a peculiar attraction for minds whose interest is not readily aroused, save by the applications of a science, or by the enumeration of specific cases, for they conform to certain modes of rhetorical expression which seem natural, because they have become habitual. We cannot do better than begin with the citation of a few examples. The first we shall borrow from the logical compendium of Archbishop Whately. Suppose some one were to argue for the reality of miracles in the following way: "If no miracles had been displayed by the first preachers of the Gospel, they could not have obtained a hearing; but they did obtain a hearing; therefore, some miracles must have been displayed by them." He would, then, employ a form of argument known as the **hypothetical syllogism.** Or, again, suppose a certain theologian of opposite faith were to say: "If the doctrines of Calvin conform with the word of God, it is not necessary to publish them separately, and if they are at variance with the word of

God, they are wicked; but either they conform or they do not; accordingly, either these doctrines are wicked or their publication is unnecessary." An argument of such a form is known as a **dilemma.**

It would be well to examine these cases with especial care, regarding the form and the content of each and endeavoring to settle, without any of the apparatus of logic, the question as to whether the argument is good or bad. After the reading of this chapter it may be profitable to return to consider them again in the light of what will have been learned. The difference between our first judgments, together with the grounds on which we base them, and our later more sophisticated ones, which will then be founded on developed theory, will yield a rough measure of the practical value of this undertaking. The word *dilemma* is from the Greek δι- *two* and λῆμμα *assumption,* and the two parts of the disjunction appearing after the first semicolon are known as the *horns* of the dilemma. Some of the dilemmatic arguments which will be set down below are historically famous, and deservedly so, for it will not always be easy to put our finger on the "screw that is loose in our logical conundrum."

DILEMMA OF THE CROCODILE

The following account of the well-known dilemma denominated "The Crocodile" we shall quote in full from one of the essays of De Quincey:

"I recall at this moment a little metrical tale of Southey's, in which the *dramatis personæ* are pretty nearly the same, *viz.*, a crocodile, a woman and her son. In that case, however, the crocodile is introduced as a person of pattern morality, for the woman says of him—

" 'The king of the crocodiles never does wrong:
He has no tail so stiff and strong
Petitioners to sweep away,
But he has ears to hear what I say.'

Not so the crocodile known to the Greek dialecticians. *He* bore a very different character. If he has no tail to interfere with Magna Charta and the imprescriptible right of petitioning, he had, however, teeth of the most horrid description for crushing petition and petitioner into one indistinguishable pulp; and, in the particular case contemplated by the logicians, having made prisoner of a poor woman's son, he was by her charged with the same purpose in regard to her beloved cub as the Cyclops in the 'Odyssey' avows in regard to Ulysses, *viz.*, that he reserved him in his larder for an *extra bonne bouche* on a gala day. The crocodile, who, generally speaking, is the most uncandid of reptiles, would not altogether deny the soft impeachment, but, in order to sport an air of liberality which was far from his heart, he protested that, no matter for any private views which he might have dallied with

in respect to the young gentleman, he would abandon them all on one condition (but, observe, a condition which he privately held to be impossible for a woman to fulfil), *viz.*, that she should utter some proposition which was incontrovertibly true. The woman mused upon this; for though she knew of propositions that no neutral party could dispute—as this, for instance, that crocodiles are the most odious of vermin—it was evident that her antagonist would repel *that* as an illiberal and one-sided personality. After some consideration, therefore, she replied thus—'You will eat my son.' There and then arose in the crocodile's brain a furious self-conflict, from which it is contended that no amount of Athenian chicanery would ever deliver him; since, if he *did* eat her son, then the woman had uttered a plain truth, which the crocodile himself could not have the face to deny, in which case (the case of speaking truth), he had pledged his royal word *not* to eat him; and thus he had acted in a way to make the word of a crocodile, or his bond, or even the tears of a crocodile, a mere jest among philosophers. On the other hand, if in contemplation of these horrid consequences he did *not* eat her son, then the woman had uttered a falsehood in asserting that he would, and it became a royal duty in *him,* as a guardian of morality, to exact the penalty of her wickedness. . . . Truth absolute was provided for; in that case the son was to be spared.

Absolute falsehood was also provided for; in that case the son was to die. But truth conditional was *not* provided for. Supposing the woman to say something contingent on a case that might or might not be realized, then it became necessary to wait for the event. But here there was no use in waiting, since, whichever of the two possible events should occur, either equally and irretrievably landed the crocodile in a violation of his royal promise."

CONSTRUCTIVE HYPOTHETICAL SYLLOGISM

The **constructive hypothetical syllogism** is of the following general form:

If x is true, then y is true;
but x is true;
therefore y is true.

This argument is called *modus ponens,* or the mood which affirms. Here the minor asserts the antecedent of the major; or, otherwise, what is asserted only hypothetically in the major is asserted absolutely or without qualification in the minor. This condition, of course, allows us to *suppress* the antecedent altogether and to assert the consequent by itself. The general rule is: whenever the antecedent is verified, the consequent is verified itself, provided the implication is a valid one. Thus suppose that I say: if the spring is late, the fruit crop will be abundant; but the spring *is* late; therefore, the

fruit crop will be abundant. The conclusion may be asserted by itself, if the premises are granted.

But it is important to observe that the conclusion *follows* whether the premises are true or not. Let us suppose the possible cases:

(1) x true and y true;
(2) x true and y false;
(3) x false and y true;
(4) x false and y false.

In the first case the major and minor are true and the conclusion may be asserted without qualification; in the second case the major is false and the minor is true and the conclusion cannot be asserted by itself; in the third case the major is true and the minor is false and the conclusion cannot be asserted by itself; in the fourth case the major is true and the minor is false and, again, the conclusion cannot be asserted by itself. Observe, however, that in the third case the conclusion, while it cannot be asserted because of the argument, because the premises cannot be suppressed, may yet be asserted on *extra-logical* grounds—*i.e.*, because it is true in point of fact; and the same remark applies to the first case.

PARADOX OF TRISTRAM SHANDY

In order to illustrate the "common-sense" tendency to suppress the antecedent when the implication seems to be a valid one, we shall quote an argu-

ment of Mr. Bertrand Russell's, an argument known as the paradox of Tristram Shandy: Mr. Russell says: "Tristram Shandy, as we know, employed two years in chronicling the first two days of his life, and lamented that, at this rate, material would accumulate faster than he could deal with it, so that, as years went by, he would be farther and farther from the end of his history. Now I maintain that, if he had lived forever, and had not wearied of his task, then, even if his life had continued as eventfully as it began, no part of his biography would have remained unwritten. For consider: the hundredth day will be described in the hundredth year, the thousandth in the thousandth year, and so on. Whatever day we may choose as so far on that he cannot hope to reach it, that day will be described in the corresponding year. Thus any day that may be mentioned will be written up sooner or later, and therefore no part of the biography will remain permanently unwritten. This paradoxical but perfectly true proposition depends upon the fact that the number of days in all time is no greater than the number of years."

Leaving out of account the question as to whether or not there is a paradox involved in the comparison of the two infinites, let us examine the following hypothetical syllogism: "If Tristram Shandy should live forever, and should not weary of his task, he will complete his biography; but it is agreed

that he shall live forever and shall not weary of his task; accordingly, he will complete his biography." The argument being formally correct, the only question is whether or not the premises may be suppressed and the conclusion asserted by itself. But in the minor it seems that we have agreed that an impossibility shall transpire; not because one cannot live forever for biological reasons, but because one cannot pass through each term of an infinite series, because one cannot come to the end of something that has no end by definition. We have agreed in the minor to regard an impossibility as possible, to regard a false proposition as true. There is no paradox, as soon as we have seen that the premises cannot be suppressed and that, therefore, the conclusion cannot be asserted by itself.

FALLACY OF AFFIRMING THE CONSEQUENT

A familiar fallacy, known as the **fallacy of affirming the consequent,** may be conveniently cited in this connection. Thus, suppose one were to argue:

"If the study of logic furnishes the mind with a multitude of useful facts it will deserve cultivation; now, we agree that it deserves cultivation; accordingly, it must furnish the mind with a multitude of useful facts."

This argument would be formally fallacious. The premises might easily be regarded as true and the conclusion as false under the same circum-

stances, for the consequent might follow from any one of a great number of antecedents. The study of logic might deserve cultivation as an aid to forensics or to legal studies; or, because its history is connected with the general history of philosophical speculation, or, because its technical vocabulary has passed into common use and cannot be properly understood by the mere help of a dictionary; or, because its foundations are presupposed by those of arithmetic and geometry; or, because constituting one of the few intellectual disciplines of the Middle Ages, a knowledge of it casts a flood of light upon the workings of the mediæval mind; and so on for any number of other reasons that might be enumerated.

A similar fallacy, and one not mentioned, so far as my knowledge extends, in the manuals of logic, consists in the inference that, because the conclusion of a true syllogism may be asserted, at least one of the premises may be asserted to be true. This we shall call the **fallacy of affirming the conclusion.** Consider the following argument:

"If all the Troglodytes are virtuous and this man is a Troglodyte, then this man is virtuous; but this man is virtuous; therefore, this man is a Troglodyte, or else all of the Troglodytes are virtuous."

The Troglodytes of the *Lettres Persanes* of Montesquieu were a mythical people, for the most part so savage and evil that the notions of human

justice and equity had ceased to operate practically in their relations with one another. They perished of their own injustice, with the exception of two families, who "were humane and loved virtue." The argument is evidently fallacious, but part of the antecedent of the major, which is a true syllogism, is false.

DESTRUCTIVE HYPOTHETICAL SYLLOGISM

The **destructive hypothetical syllogism** is of the following general form:

If x is true, then y is true;
but y is untrue;
therefore x is untrue.

This argument is called *modus tollens,* or the mood which denies. Thus: "If perfect justice prevailed on earth, then virtue would receive its reward in this life; but virtue is not compensated for here below; therefore, perfect justice does not prevail on earth."

Voltaire, ridiculing the dictum of Leibniz that "all things are for the best in the best of all possible worlds," prefers to believe in a finite rather than a wicked God. An argument commonly given is: "If God were both omnipotent and good he would moderate the grosser evils in the world; but he does not do this; accordingly, either he is an evil being, or else his power is limited."

FALLACY OF DENIAL OF THE ANTECEDENT

The characteristic fallacy to be noticed in connection with this type of argument is the **fallacy of denial of the antecedent.** We quote from Jevons:

" 'If the study of logic furnished the mind with a multitude of useful facts like the study of other sciences, it would deserve cultivation; but it does not furnish the mind with a multitude of useful facts; therefore it does not deserve cultivation.' This is evidently a fallacious argument because the acquiring of a multitude of useful facts is not the only ground on which the study of a science can be recommended. To correct and exercise the powers of judgment and reasoning is the object for which logic deserves to be cultivated, and the existence of such other purpose is ignored in the above fallacious argument."

A valid argument, of a form more general than the destructive hypothetical syllogism, may be described as follows:

> If x and y are true, then z is true;
> but x is true and z is false;
> therefore, y is false.

Thus we might imagine Horatio to address Hamlet: "If my name is Horatio and I speak truth, it was thy father's ghost."

And Hamlet to reply: "Thy name is Horatio, but 'twas no ghost; ergo, thou speakest falsely."

The corresponding fallacy may be termed the **fallacy of denial of a premise.** A bad argument would result, if one were to reason as follows:

"The Germans may win on land, but if the British navy remains intact, they will not be able to dictate the peace. Therefore, if they win both on land and on sea, they will be able to dictate the peace."

COMPLEX HYPOTHETICAL SYLLOGISM

There is a further form of the hypothetical syllogism, to which attention may be profitably directed, but which is not specifically mentioned, I believe, in the elementary compendiums. We shall term it the **complex hypothetical syllogism.** Its general expression is:

> If x and y are true, then z is true;
> but z is untrue;
> therefore, either x is untrue or y is untrue.

The corresponding fallacy, or the one most commonly to be met with in connection with this argument, will be illustrated by a single example. It consists in interchanging minor and conclusion in the form given above.

"If all Shakespearean scholars are Englishmen and Churchill is a Shakespearean scholar, then Churchill is an Englishman; but either not all

Shakespearean scholars are Englishmen, or Churchill is not a Shakespearean scholar; therefore, Churchill is not an Englishman."

Another case would arise, if we were to infer, because the two premises of a true syllogism are false, that the conclusion is false.

Exercises

Select from the following such as are valid arguments:

1. If a thing can be conceived as nonexistent, its essence does not involve existence; but it is not of the essence of a centaur to exist; therefore, a centaur can be conceived as nonexistent.
2. The world cannot have existed always if it had a beginning in time; but it can have existed always; therefore, it had no beginning in time.
3. There would be no such thing as freedom, if all causation were according to natural law; but human freedom is a fact; therefore, not all causation is in accordance with natural law.
4. Human freedom is meaningless if God is omniscient, for he is then aware of what our decision in any case will be, before we decide; but man *is* a free agent; therefore, it cannot be that God is altogether omniscient.

CHAPTER XII

THE DILEMMA

The **dilemma** is an argument very commonly employed whenever it can be shown that any one of a number of possibilities leads to the same result. We shall introduce our theory of this mode of reasoning with a quotation from Archbishop Whately. It was "urged by the opponents of Don Carlos, the pretender to the Spanish throne; which he claimed as male heir, against his niece the queen, by virtue of the Salic law excluding females; which was established (contrary to the ancient Spanish usage) by a former king of Spain, and was repealed by King Ferdinand. They say 'if a king of Spain has a right to alter the law of succession, Carlos has no claim: and if no king of Spain has that right, Carlos has no claim; but a king of Spain either has or has not such right; therefore (on either supposition) Carlos has no claim.' " It will be a good exercise for the student, when he has finished his reading of this chapter, to undertake to retort this argument.

THE PARADOX OF GORGIAS

Another example is to be found in the contention of the Greek Gorgias that nature does not exist. Thus, if the world had a beginning in time, an in-

finite time must have elapsed before the moment of creation; but an infinite time never can elapse, and hence the moment of creation could never have arrived. Accordingly, the world is *uncreated.* If the world had no beginning in time (*i.e.,* has always existed), an infinite time must have elapsed before the present moment; but this is impossible; we cannot come to the end of something that has no end; therefore, the world must have been *created.*

The fact that time is infinite would have to be established by a separate proof. Thus, if past time were only finite, there must have been a *time* when there was no time (a formal contradiction); and if future time were only finite, there will come a *time* when there is no time (a formal contradiction). Consider the statement: x is both a and not-a, where x is some individual thing or class and a is a property, which it may or may not possess. It is evident that, of classes, the only values of x that will make this a true statement are classes that contain no objects. It will be untrue that triangles are both three-sided and not three-sided, but true that square-triangles are both square and not-square at the same time. Similarly, if x stands for *nothing,* the statement, nothing is both a and not-a, is true. Now, as regards the word, it is forced upon us that it is both *created* and *uncreated;* and since this is true, it is forced upon us that the world is *nothing* (*i.e.,* a nonexistent something).

THE PARADOX OF CORAX AND TISIAS

For the benefit of those who will refuse to consider seriously a philosophical dispute of this sort (and there are many such) we shall furnish an instance related to the experience of daily life. Before there was any science of logic, the Greek sophists (the traveling teachers) taught an art of argumentation, which was often applied practically within the courts of law. We cite the following well-known case from the *Lectures* of Sir William Hamilton: It is known as the *Litigiosus* or *Reciprocus.*

"Of the history of this famous dilemma there are two accounts, the Greek and the Roman. The Roman account is given us by Aulus Gellius, and is there told in relation to an action between Protagoras, the prince of the sophists, and Euathlus, a young man, his disciple. The disciple had covenanted to give his master a large sum to accomplish him as a legal rhetorician; the one half of the sum was paid down, and the other was to be paid on the day when Euathlus should plead and gain his first cause. But when the scholar, after the due course of preparatory instruction, was not in the same hurry to commence pleader as the master to obtain the remainder of his fee, Protagoras brought Euathlus into court and addressed his opponent in the following reasoning: "Learn, most foolish of

young men, that however matters may turn up (whether the decision to-day be in your favor or against you), pay me my demand you must. For if the judgment be against you, I shall obtain the fee by decree of the court, and if in your favor, I shall obtain it in terms of the compact, by which it became due on the very day you gained your first cause. You thus must fail, either by judgment or by stipulation." To this Euathlus rejoined: "Most sapient of masters, learn from your own argument that whatever may be the finding of the court, absolved I must be from any claim by you. For if the decision be favorable, I pay nothing by the sentence of the judges, but if unfavorable, I pay nothing in virtue of the compact, because, though pleading, I shall not have gained my cause." The judges, says Gellius, unable to find a *ratio decidendi,* adjourned the case to an indefinite day, and ultimately left it undetermined. I find a parallel story told, among the Greek writers, by Arsenius, by the Scoliast of Hermogenes, and by Suidas, of the rhetorician Corax (*anglicè* Crow) and his scholar Tisias. In this case, the judges got off by delivering a joke against both parties, instead of a decision in favor of either. We have here, they said, the plaguy egg of a plaguy crow, and from this circumstance is said to have originated the Greek proverb, *κακοῦ κόρακος κακὸν ᾠόν.*"

COMPLEX CONSTRUCTIVE DILEMMA

The **complex constructive dilemma** has the form: If x is true, then y is true, and if z is true, then w is true; but either x is true or z is true; therefore either y is true or w is true.

Our illustrations are taken from Whately. Thus, "If the obedience due from Subjects to Rulers extends to religious worship, the ancient Christians are to be censured for refusing to worship the heathen idols; if the obedience, etc., does not so extend, no man ought to suffer civil penalties on account of his religion; but the obedience, etc., either does so extend, or it does not; hence, either the ancient Christians are to be censured, etc., or else no man ought to suffer civil penalties on account of his religion.

Or, again: "If man is capable of rising, unassisted, from a savage to a civilized state, some instances may be produced of a race of savages having thus civilized themselves; and if man is not capable of this, then the first rudiments of civilization must have originally come from a superhuman instructor; but either man is thus capable, or not; therefore, either some such instance can be produced, or the first rudiments, etc."

COMPLEX DESTRUCTIVE DILEMMA

The **complex destructive dilemma** has the form: If x is true, then y is true, and if z is true, then w

is true; but either y is untrue or w is untrue; therefore, either x is untrue or z is untrue.

Thus: "If this man were wise, he would not speak irreverently of Scripture in jest; and if he were good, he would not do so in earnest; but he does it either in jest or in earnest; therefore, he is either not wise, or not good."

The commonest fallacy to be noticed in connection with the dilemma is the case in which the minor is not a true disjunction—*i.e.*, the case in which the minor does not exhaust all of the possibilities. The conclusion can only be asserted when the premises are true, unless, to be sure, it is true in independence of the argument. We quote from Jevons:

"Dilemmatic arguments are, however, more often fallacious than not, because it is seldom possible to find instances where two alternatives exhaust all the possible cases, unless one of them be the simple negative of the other in accordance with the law of excluded middle. Thus if we were to argue that if a pupil is fond of learning he needs no stimulus, and that if he dislikes learning no stimulus will be of any avail, but as he is either fond of learning or dislikes it, a stimulus is either needless or of no avail, we evidently assume improperly the disjunctive minor premise. Fondness and dislike are not the only two possible alternatives, for there may be some who are neither fond of learning nor dislike it,

and to these a stimulus in the shape of rewards may be desirable."

A dilemma is said to be retorted, whenever an equally cogent dilemma to the contrary effect is produced. The retort of Euathlus to Protagoras is a case in point, and the argument of Gorgias contains two cogent dilemmas in the opposite sense, both of which the arguer accepts as valid. An Athenian mother, according to Aristotle, addressed her son in the following words: "Do not enter into public business, for if you say what is just, men will hate you; and if you say what is unjust, the gods will hate you." To which Aristotle retorts: "I ought to enter into public affairs; for if I say what is just, the gods will love me; and if I say what is unjust, men will love me."

PROOF OF THE DILEMMATIC ARGUMENT

In concluding this chapter we shall establish the formal validity of the dilemmatic argument, basing our proof on the principles which follow, and assuming (as is commonly done) the identity of the implication, *x* is untrue implies *y* is true and the disjunction, either *x* is true or *y* is true.

Principle I.—If antecedent and consequent of a valid implication be contradicted and interchanged, a valid implication will result.

Principle II.—If in any valid implication a factor

in the antecedent be strengthened, or the consequent be weakened, a valid implication will result.

Principle III.—If in any valid implication the same factor be conjoined to both antecedent and consequent, a valid implication will result.

(1) If (major) y is untrue implies x is untrue; and (minor) x is untrue implies z is true; then (conclusion) y is untrue implies z is true.

For (Principle II) the minor allows us to weaken the consequent of the major.

(2) If (antecedent) x is true implies y is true; then (consequent) y is untrue implies x is untrue.

For (Principle I) the antecedent and consequent of the principal antecedent may be contradicted and interchanged.

(3) If (major) x is true implies y is true; and (minor) x is untrue implies z is true; then (conclusion) y is untrue implies z is true.

For the major (1), being the same as the consequent of (2), may be strengthened (Principle II) to the antecedent of (2).

(4) If x is true implies y is true; and z is true implies w is true; and x is untrue implies z is true; then (consequent) y is untrue implies z is true and z is true implies w is true.

For (Principle III) the same factor (z is

true implies w is true) may be conjoined to both antecedent and consequent of (3).

(5) If (major) y is untrue implies z is true; and (minor) z is true implies w is true; then (conclusion) y is untrue implies w is true.
For (Principle II) the minor allows us to weaken the consequent of the major.

(6) If x is true implies y is true; and z is true implies w is true; and x is untrue implies z is true; then y is untrue implies w is true.
For the consequent of (4) being the same as the antecedent of (5) may be weakened (principle II) to the consequent of (5).

(7) If x is true implies y is true; and z is true implies w is true; and either x is true or z is true; then either y is true or w is true.
For we shall assume the right (as is commonly done) to replace the last premise and the conclusion of (6) by the disjunctions that appear in (7).

The result (7) will be recognized as the complex constructive dilemma, which has, accordingly, been derived from the three principles, which we assumed at the outset. The proof is laborious, when expressed without the aid of symbols. In that case the whole derivation could be set forth in a few lines. The proof of the complex destructive dilemma is left as an exercise for the student.

THE DILEMMA

Exercises

Select from the following such as are valid arguments:

1. If this man is a realist, he believes that the order of nature is independent of mind, and if he is an idealist and believes it dependent on mind, he must assume an absolute object; but either he believes it dependent or not; therefore in either case, he must profess belief either in an absolute object or in an absolute order of nature.
2. If a body moves, it must move in the place where it is or in the place where it is not; it cannot move where it is, for then it would not be there, and obviously it cannot move where it is not. Accordingly, its motion is impossible.

CHAPTER XIII

THE SORITES

The **sorites** is of the same form as the syllogism, for its terms are arranged in the same way in a cyclical order, but it is of a more general character. The number of terms is greater than three and, as in the case of immediate inference and syllogism, the number of premises is one less than the number of terms. Because there is sometimes a large number of premises, it will be more convenient to employ in place of the class-symbols, *a, b, c,* etc., the ordinal numbers, *1, 2, 3,* etc.

CONSTRUCTION OF THE VALID MOODS

We shall begin by illustrating the manner of constructing a valid mood of the sorites from a chain of valid syllogisms. Suppose that we were to be given the chain,

A(*21*) and A(*32*) implies A(*31*),
A(*31*) and A(*43*) implies A(*41*),
A(*41*) and A(*54*) implies A(*51*),

and were asked what valid moods of the sorites is thereby implied. It is clear that the major premise of the last syllogism, being the same as the con-

clusion of the second, may be strengthened to A(*31*) and A(*43*). The immediate result of this strengthening is a valid mood of the sorites, *viz.*,

A(*31*) and A(*43*) and A(*54*) implies A(*51*).

The major premise of this last implication may in turn be strengthened to A (*21*) and A (*32*) because of the first syllogism, and we should have

A(*21*) and A(*32*) and A(*43*) and A(*54*) implies A(*51*).

This, then, is the valid mood of the sorites whose truth is implied by the chain of generating syllogisms.

Another method of constructing a valid mood of the sorites from a chain of syllogisms depends upon another principle.

Principle.—If in any valid implication the same factor be conjoined to both antecedent and consequent, a valid implication will result.

Let our chain of syllogisms be

E(*21*) and A(*32*) implies E(*31*),
E(*31*) and I(*34*) implies O(*41*),
O(*41*) and A(*45*) implies O(*51*),

and suppose that we conjoin to antecedent and con-

sequent of the first syllogism the minor premise of the second and so obtain

E(*21*) and A(*32*) and I(*34*) implies
E(*31*) and I(*34*).

The second syllogism allows us to weaken the consequent of this result to O(*41*) and upon carrying out this operation we should obtain

E(*21*) and A(*32*) and I(*34*) implies O(*41*).

Now conjoin to antecedent and consequent of this mood of the sorites the minor premise of the third syllogism, A(*45*)—that is,

E(*21*) and A(*32*) and I(*34*)
and A(*45*) implies O(*41*) and A(*45*),

and weaken the consequent of this implication to O(*51*) by authority of the last member of the chain. Accordingly,

E(*21*) and A(*32*) and I(*34*)
and A(*45*) implies O(*51*),

is the valid mood of the sorites which was to be generated.

THE INVERSE OPERATION

Finally, let us consider the operation which is inverse to the preceding. Suppose, being given a valid mood of the sorites, we should be asked to find

the chain of syllogisms upon which it depends. Let the mood be

A(*12*) and A(*23*) and O(*43*)
and A(*45*) and A(*56*) implies O(*61*).

The premises of the first syllogism of the chain will be the same as the first two premises of the sorites and the minor of the second syllogism will be the same as the third premise of the sorites and so on. The fragment of the chain so far ascertained will be:

A(*12*) and A(*23*) implies
and O(*43*) implies
and A(*45*) implies
and A(*56*) implies

Now the conclusion of the first syllogism, whose premises appear out of the normal order, is evidently A(*13*) and this must be the major of the syllogism which follows. The conclusion of this in turn is determined as O(*41*). If we were to continue this process, each member of the chain in succession would be ambiguously determined as,

A(*12*) and A(*23*) implies A(*13*),
A(*13*) and O(*43*) implies O(*41*),
O(*41*) and A(*45*) implies O(*51*),
O(*51*) and A(*56*) implies O(*61*).

RULES OF THE SORITES

From the considerations that have gone before we conclude that certain valid moods of the sorites can be constructed from chains of valid syllogisms. A complete solution of the sorites would contain a proof that the only valid moods that exist can be built up from chains of valid syllogisms in the manner described. This proof is too advanced for a work of this character. We observe, however, that it depends upon the following truths:

1. If the conclusion is affirmative, then all the premises are affirmative.

2. If the conclusion is negative, then one and only one premise is negative.

3. If the conclusion is universal, then all the premises are universal.

4. If the conclusion is particular, then not more than one premise is particular.

Exercises

1. What valid mood of the sorites can be generated from the following chain of syllogisms?

$$\begin{gathered} A(21) \text{ and } A(32) \text{ implies } A(31), \\ A(31) \text{ and } A(43) \text{ implies } A(41), \\ \cdot \quad \cdot \quad \cdot \quad \cdot \quad \cdot \quad \cdot \quad \cdot \quad \cdot \quad \cdot \\ A(n\text{-}1\ 1) \text{ and } A(n\ n\text{-}1) \text{ implies } A(n\ 1). \end{gathered}$$

2. From what chain of valid syllogisms can we build up the sorites,

A(*21*) and A(*32*) and . . .
. . . and A(t t-*1*) and I(t t+*1*) and A(t+ *1* t+*2*) . . .
. . . and A(n-*1* n) implies I(n *1*)?

3. Which one of the rules enunciated at the end of this chapter will establish the invalidity of the sorites,

E(*12*) and E(*23*) and E(*34*) implies E(*41*)?

4. State a rule analogous to one of the rules of the syllogism which will declare to be invalid:

A(*12*) and A(*32*) and A(*43*) implies A(*41*).

CHAPTER XIV

THE VERIFICATION OF THE CLASSICAL SYSTEM

In order that the classical system should hold true in all of its parts, certain characteristic conditions must be satisfied. Besides the moods *Barbara* and *Celarent,* which have been set down as postulates, we should have to have:

(1) Corresponding to each member of the set, A, E, I, O, there is another member of the same set which stands for its contradictory.

(2) Subalternation, A implies I, and E implies O, holds true.

(3) The subject and predicate of E and I alone are simply convertible.

SUPPOSED BREAKDOWN OF THE CLASSICAL SYSTEM

To-day it is all but universally taken for granted that not all these conditions hold for all meanings of the terms, and it is usual to retain the first and last and to assert that the relation of subalternation breaks down. Citations similar to the two set down below might have been selected from any one of a dozen separate authors. Thus Mr. Bertrand Russell remarks:[1] "With our definitions, All S is P

[1] *Introduction to Mathematical Philosophy,* p. 164. London, 1919.

does not imply Some S is P, since the first allows the nonexistence of S and the second does not; thus conversion *per accidens* becomes invalid, and some of the moods of the syllogism are fallacious—*e.g., Darapti:* All M is S, All M is P, therefore Some S is P, which fails if there is no M." Or, to quote from Padoa's exposition of Peano's logic[1]: "The untruth of the traditional moods of the syllogism, by means of which from two *universal* judgments one would deduce a *particular* judgment, has been recognized separately by Miss Ladd (1883), Schröder, Nagy, Peano, etc. It is one of the first and most remarkable results of the adoption of a logical ideography."

In order to understand how this breakdown occurs, the student must become acquainted with what is termed in modern logical theory a *null*-class—that is, a class which contains no objects, or whose value in extension is zero. Thus, the class "square circles" is null and so is the class "fractional integers." The implication,

> All square circles are circles implies
> that some square circles are circles,

is supposed to break down, because the antecedent is taken to be true and the consequent is taken

[1] *"La Logique Déductive,"* etc., *Revue de Métaphysique et de Morale,* vol. 20, p. 67.

to be false; it being commonly assumed that the particular affirmative, some *a* is *b*, is untrue unless members of the *ab* class (what is *a* and *b*) exist.

To consider the case of a syllogism that is supposed to be fallacious let us select the mood *Darapti*,

All square circles are circles,
All square circles are squares,
Some squares are circles,

which appears to be invalid if the premises are taken to be true.

REASON FOR THIS MISAPPREHENSION

This apparent breakdown of the classical system depends, however, upon the fact that the interpretation of the Aristotelian propositions has been too narrowly rendered. Thus, it has seemed altogether natural to the workers in this field to recognize the following identities:

A (*ab*) = *a* is included in *b*,
E (*ab*) = *a* is included in non-*b*,
I (*ab*) = *a* is not included in non-*b*,
O (*ab*) = *a* is not included in *b*.

It will be observed that on this interpretation A and O, and E and I are contradictory pairs. Also it is

true that E and I alone are simply convertible; for, in the first place,

> If *a* is included in non-*b*
> then *b* is included in non-*a*,

is a true statement in the modern Boolean algebra and the corresponding implication holds for the case of I; and, secondly,

> If *a* is included in *b*,
> then *b* is included in *a*,

is untrue, and the same holds for the corresponding case of O.

Subalternation, however, breaks down, for if *a* and *b* are both *null,* and non-*a* and non-*b,* consequently, *universe,* we should have:

> If the members of the null-class are included among the members of the null-class, then the members of the null-class are not contained among the members of the universe.

Here the antecedent is true and the consequent is false, so that subalternation fails, when the terms are taken to represent empty classes.

SOLUTION OF THE DIFFICULTY

We shall now give a rendering of the propositional functions, A, E, I, and O, which not only will verify all of the implications of the classical logic set down in the preceding chapters, but which will accord equally well with the usage of language and with common sense.[1] These somewhat more extended meanings are:

A(ab) = a is included in b **and** a is not null **and** b is not null,
E(ab) = a is included in non-b, **or** a is null **or** b is null.
I(ab) = a is not included in non-b **and** is not null **and** b is not null.
O(ab) = a is not included in b **or** a is null **or** b is null.

If the student will recall what was said in Chapter III of the manner in which a conjunction may be expressed as a disjunction and conversely, he will have no difficulty to verify the fact that A and O, and that E and I are contradictory pairs. Moreover, it will be clear that E and I alone are simply convertible. It will prove a more difficult task for him to verify the relation of subalternation, but he may, perhaps, satisfy himself by considering the case in which the terms are allowed to become null.

[1] Professor Singer has suggested an interpretation of these forms which retains A(aa), but gives up E(aa'). No interpretation will conform *altogether* with common usage.

In the case of *Darapti* he will be able to see that the premises become false when the middle term becomes null and that, consequently, the mood remains valid under all conditions. If the reader happens to be conversant with the modern calculus of classes, and so habitually employs symbols to designate the operations of logic, he will be able easily to verify all of the postulates that have been set down in the chapters that have gone before.

RECONCILIATION WITH COMMON SENSE

The classical logic, therefore, does not break down, as is commonly supposed, but may be taken to hold true in all of its parts. It only remains to be shown that the interpretations of the propositions, A, E, I, and O, which we have given above, are as much in accord with common experience and with common sense as the ones that are ordinarily accepted. Consider the proposition "all *a* is *a*." On our interpretation this will be true for all meanings of *a* except when *a* is null. Thus,

All Athenians are Athenians

means, when expressed in full,

> The members of the class Athenians are included among the members of the class Athenians; and Athenians are not included among non-Athenians."

And this is a true statement.

There are cases, too, in which common sense agrees with the interpretations of the categorical forms that have just been given, and disagrees with those that are commonly recognized. Suppose the proposition:

> Every aged Achilles who is mentioned in the "Iliad" is there celebrated as the swift of foot.

Now, since only one Achilles is mentioned in the "Iliad" and since he died in his youth, the subject of this proposition is a null or an empty class. On the rendering usually given the above statement would be true; on the amended rendering suggested above it would be false, and it is certain that common sense is in agreement with the last interpretation and not with the former.

Again, the assertion, no *a* is non-*a*, is true by both renderings. On the first interpretation it becomes

> Athenians are included among non-non-Athenians,

and, on the second interpretation, it becomes the same with the added condition,

> Or else Athenians is a null-class,

it being allowed to omit this last part from the com-

plete disjunction, because it is (empirically) untrue.

EFFECT ON CONTRAPOSITION AND ON OBVERSION

It is appropriate to mention here some of the transformations that are recognized in traditional logic. The operation of conversion of the terms by *contraposition* as explained before, consists in replacing the terms by their negatives and interchanging them. It is supposed to hold of A and O, but not of E and I. Thus,

All *a* is *b*

is taken to be equivalent to

All non-*b* is non-*a*.

We observe that, except for the meanings *null* and *universe*—that is, for all concrete meanings of the terms but these—contraposition holds in the rendering of A and O which we have given. Thus,

All Athenians are Greeks

becomes as a result of this operation:

> Non-Greeks are included among non-Athenians; and non-Greeks are not Greeks; and non-Athenians are not Athenians,

a statement which is manifestly true, and

Some Greeks are not Athenians

becomes, when converted by contraposition,

> Non-Athenians are not included among non-Greeks; or else non-Greeks are Greeks; or else non-Athenians are Athenians.

the latter parts of the disjunction seeming in common sense rather to reinforce the truth of the part that is first expressed.

Again, except for the meanings *null* and *universe* —that is, for all other meanings of the terms—the identity commonly assumed for "no *a* is *b*" and "all *a* is non-*b*," will hold true. In general it may be observed that the interpretation which we have given of the propositions, A, E, I, and O are identical with the ones that are traditionally offered, for all meanings of the terms except for these limiting values. We conclude, then, that the classical logic may be considered to hold true in all of its parts and that the modern view, that subalternation and some of the valid moods of the syllogism are fallacious, is based upon a misapprehension.

BIBLIOGRAPHY

For the benefit of the student who may desire to acquaint himself with the more recent trend of logical research a few references in English are listed below. The work of Boole may furnish him a starting point, but in such a field there is no set manner of beginning, just as there is no royal road to the end. In German there is Schröder's *Abriss*, by Müller, Leipzig, Teubner, 1909; and in French, Padoa's introduction to Peano's system, Paris, Gauthier-Villars, 1912. Before he attempts the *Principia Mathematica* of Whitehead and Russell he will do well to consult the admirable *Survey* of Mr. C. I. Lewis. He will find there a bibliography that will be quite sufficient for all of his purposes.

A BRIEF TEXT-BOOK

OF

LOGIC AND MENTAL PHILOSOPHY

By REV. CHARLES COPPENS, S. J.

$1.25. (*Discount is allowed to Schools.*)

PHILADELPHIA, Jan. 14, 1893.

MY DEAR FATHER COPPENS:

I received from your publisher your admirable work on "Logic and Mental Philosophy." It is just the work needed at the present time, and I earnestly recommend its use in our colleges.

† P. J. RYAN, *Archbishop of Philadelphia.*

CATHOLIC PUBLICATION SOCIETY CO.:

I received your note kindly sending to my address the precious work "Logic and Mental Philosophy"....I read the work and I consider it most useful for our colleges as a text-book, and of great advantage for those who have finished their studies, as well as for Catholics in general.

† F. MORA, *Bishop of Monterey and Los Angeles.*

Father Coppens, we think, has produced a book which will meet all the requirements of the English student of philosophy. It embodies a thorough course of Logic and Metaphysics, expressed in clear, concise language, and is printed with a care for those details—division of questions, diversity of type, accentuation of paragraphs, etc.—which go to make up a text-book, and cannot fail to arrest and fix the attention of the reader. Needless to say, the Encyclical of the Holy Father has been the inspiration of the learned author, and the philosophy of St. Thomas permeates the whole work. We feel assured it will meet with a hearty welcome in all our schools and colleges.—*Ave Maria.*

If we were to characterize the present work of Father Coppens in a sentence, we would call it Philosophy Simplified; for in treatment, style and terminology, the technical is eschewed as far as possible; and we are indebted to Father Coppens for some English equivalents to philosophical Latin which cannot fail to prove of great service to the reader of metaphysical principles in every day discussions. But praise is superfluous. Father Coppens' work supplies the need, and this not only in the class-room for advanced students, but for the general reader who has stepped over the threshold of graduation.—*Church Progress.*

LOGIC AND MENTAL PHILOSOPHY.

. . . . Father Coppens' book will be a safe, a very safe guide, and a very easy one, considering the subject matter, for young students of philosophy. Their Latin text-books will be better understood and appreciated for this help, of which we urge everyone who may begin the study of philosophy to avail himself at once. Indeed, we have not the slightest misgiving that the small manual will prove a most valuable aid both to those who pursue the two years' course, and much more to others who can devote only one year to it, or who, having failed in the thorough mastery of a system of philosophy heretofore, are anxious to supply the loss at the least possible cost of time and severe application.—*American Ecclesiastical Review.*

It is almost impossible to read newspapers or magazines without encountering articles on topics not to be understood without a knowledge of these subjects, and it is well that the young student should be prepared to detect their fallacies. This book will give him the necessary knowledge, and will also increase his pleasure in reading really able arguments.—*The Pilot.*

Those who are acquainted with Father Coppens' text-books of "Rhetoric" and "Oratorical Composition," will be prepared to find in this new work of his a model of order and thoroughness, combined with an attractive style, and they will not be disappointed. The treatment of logic in its dialectic side is the best brief statement for school use that we have yet seen in English. The critical side of the logic is compendious, but by no means dry. The latter two-thirds of the work is devoted to mental philosophy. The views of the Stonyhurst Manuals are reflected in this book, only that the American Jesuit has systematized the matter in a way to make all teachers grateful to him. The work is printed and set out with the usual elegance that has characterized the press-work of the Catholic Publication Society Company.—*Catholic Review.*

Father Coppens has fully carried out his aim to give "a brief outline of sound philosophy." The only fault we might point out is that, in parts, it would seem a little too brief. Apart from this the teaching is clear, orderly, and exact; and, what is of great consequence, thoroughly loyal to the scholastic doctrine.—*Dublin Review.*

The aim of this little volume, in the modest words of the author, is simply "to present to pupils unfamiliar with Latin a brief outline of a sound philosophy conformable to the teachings of the schoolmen." It is chiefly meant for "class use in academies and similar institutions"; and we will add, for use in our Catholic reading circles, to which we take great pleasure in heartily recommending it. We conceive that, in the hands of a good director, it would soon make logic and mental philosophy extremely popular with our young men and women.—*American Catholic Quarterly Review.*

PREFACE.

THESE pages are a modest contribution towards the accomplishment of an important purpose. They are written in compliance with an earnest desire repeatedly expressed in the solemn utterances of our venerated Supreme Pontiff Leo XIII. "The more active," he says, "the enemies of religion are to teach the unlearned, the young especially, what clouds their intellect and corrupts their morals, the more should you exert yourselves to establish not only a well-adapted and solid method of instruction, but a method in perfect conformity with the Catholic faith, especially as regards Mental Philosophy, on which the right teaching of all the other sciences in a great measure depends—a Philosophy which shall prepare the way for Divine Revelation instead of aiming at its overthrow."

Thus spoke the Holy Father in his Encyclical "Inscrutabili" at the opening of his Pontificate. What this Philosophy should be, he soon after explained in a special Encyclical "On the Higher Studies." It should be the Philosophy of the Schoolmen, the system founded upon the teachings of Aristotle, which was carried to its perfection by St. Thomas in the thirteenth century, and which has held its place in most of the Catholic Colleges and Universities to the present day. "Among the doctors of the Schools," he says, "St. Thomas stands forth by far the first and master of

215265

all. . . . . To this we must add," the Encyclical continues, "that this Angelic Doctor extended the sphere of his philosophic conclusions and speculations to the very reasons and principles of things, opening out the widest field for study, and containing within themselves the germs of an infinity of truths, an exhaustless mine for future teachers to draw from at the proper time and with rich results. As he used the same intellectual process in refuting error, he succeeded in combating single-handed all the erroneous systems of past ages, and supplied victorious weapons to the champions of truth against the errors which are to crop up in succession to the end of time."

Of this Philosophy there exist many excellent text-books in the Latin, but very few in the English tongue; the present little volume does not attempt to rival their perfection. Its aim is simply: to present to pupils unfamiliar with Latin a brief outline of a sound Philosophy conformable to the teachings of the Schoolmen. It was composed before the excellent Stonyhurst Series of English Manuals of Catholic Philosophy was published; but it is chiefly meant for a different purpose, viz.: for class use in Academies and similar institutions, for which that collection of Manuals is too voluminous, though invaluable as works of reference for professors and pupils. The author sincerely hopes that his modest efforts will contribute to the propagation of sound Philosophic learning.

THE AUTHOR.

DETROIT COLLEGE, August 20, 1891.

INTRODUCTION.

1. **Philosophy** is the science which investigates the highest causes of all things in as far as they are knowable by reason. That portion of Philosophy which terminates in theory or speculative knowledge is called *Theoretical* or *Mental Philosophy*, or *Metaphysics*. That portion which applies first principles to practice, directing the moral conduct of men, is styled *Practical* or *Moral Philosophy*, or *Ethics*.

2. Since reason is to be our guide in all these investigations, we must begin by examining, (*a*) What process our reason must follow that it may guide us with safety, and (*b*) How far our natural powers of mind can give us unerring certainty. This double task is the scope of **Logic**, which science must first be studied, because it is the foundation of the mental and moral structure. It is as truly a part of Philosophy as the foundation is a part of the building.

3. **Human reason and Divine Revelation** are two means by which truth is manifested to man; they cannot contradict one another: as a matter of fact, that which is evident to reason is never found in conflict with Revelation. Hence arises a precious advantage for the Christian philosopher, of which he were foolish not to avail himself. For, knowing that the path of reason, often difficult to trace correctly, must run parallel to the high road of supernatural Revelation, he will be guarded by the clear and infallible teachings of the

Faith against the vain pursuit of false theories. Thus, Faith, far from enslaving, liberates his intellect from the shackles of ignorance and error. Philosophy looks not for novelties, nor does it aim at originality of thought, but it studies the eternal and unvarying principles of truth.

4. Among the purely human sciences, Philosophy is the **noblest and most important**; for its final purpose is the most exalted, its process the most intellectual, and its teachings secure the foundation of the other sciences. These receive from it their principles, the laws of their investigations, and the ends or purposes to which they should be directed.

PART I.

LOGIC.

5. **Logic** is the science which directs the mind in the attainment of truth. By a **science** we mean the knowledge of things in connection with their causes. Logic is properly called a science, because it considers not only the rules which direct the mind in the attainment of truth, but also the causes or reasons why they do so.

6. It comprises **two parts.** That portion which considers the modes or forms of mental action, and, in particular, the rules to be observed in reasoning or discussing, is called *Formal Logic* or *Dialectics* (διαλέγομαι, I discuss); that portion which studies the matter or truth attained, criticising the reliability of mental action, is *Material Logic*, also styled *Critical* or *Applied Logic.*

BOOK I.

DIALECTICS.

7. In treating of Dialectics, the **main purpose** of a text-book is to teach pupils how to reason correctly themselves, and readily to detect flaws in the false reasonings of others. To this practical purpose we shall almost exclusively confine ourselves. Setting aside, therefore, all other details usually insisted on in works on Formal Logic, we shall here treat of reasoning only, and of a few such preliminary matters as must be understood before the reasoning process itself can be properly explained. We shall therefore treat, in Chapter I., of *simple apprehensions and judgments*, and, in Chapter II., of *reasoning* itself.

CHAPTER I.

SIMPLE APPREHENSIONS AND JUDGMENTS.

8. We shall consider: 1. *The nature of simple apprehensions.* 2. *The most important distinctions regarding ideas*, and 3. *Judgments*, together with the expression of them in *propositions.*

Article I. The Nature of Simple Apprehensions.

9. **Simple apprehension** is the act of perceiving an object intellectually, without affirming or denying anything concerning it. To *apprehend* is to take hold of a thing as if with the hand; an *apprehension*, as an act of the mind, is an intellectual grasping of an object. The mind cannot take an object physically into itself; but it knows an object by taking it in intellectually, in a manner suited to its own nature, forming to itself an intellectual image, called a *species* of the object. The act of forming this mental image is called a *conception*, and the fruit of it, the image itself, is the *concept*, *idea*, or *notion* of the object. The word *simple* added to apprehension emphasizes the fact that the apprehension neither affirms nor denies the existence of the object; it affirms nothing and denies nothing, it simply conceives the idea of the object.

10. This intellectual image should not be confounded with the sensible image, or **phantasm**, which is a material representation of material objects, and which is formed by the imagination, by means of the material organ of the brain.

The difference between these two images is great, and distinction between them is of vital importance in Philosophy. For instance, I intellectually *conceive* a triangle by apprehending a figure enclosed by three lines and thus having three angles. My notion or idea contains this and nothing more; it is very precise, and every one who conceives a triangle conceives it exactly the same way. But when I *imagine* a triangle, I cannot help imagining it with sensible material accidents, as being of such or such a size and shape, a foot long at one time, a mile long at another. The picture may be vague, various pictures of triangles may be blended together; but it can never be universal, representing all possible triangles, as my idea does. This imagination is a *phantasm.* True, phantasms are often called 'ideas' by English writers; in fact, the whole school of Berkeley, Hume, and their followers fail to trace any difference between them; it is the fundamental error of their pernicious philosophy. Thus, for instance, Huxley maintains that God, the soul of man, etc., are unknowable and unthinkable,* because we can form no phantasm of them. This makes them simply unimaginable, not unknowable nor unthinkable; we know what we mean when we speak of them. (On the difference between ideas and phantasms see, further, *Logic*, by Richard Clarke, S.J., c. vi.)

Our ideas are expressed by words, or *oral terms;* the ideas themselves are often called *mental terms.*

Article II. Distinctions regarding Ideas.

11. Logicians go into much detail on a variety of distinctions with respect to ideas; it will be sufficient for our present purpose briefly to notice a few of them.

* *Essay on Science and Morals.*

A first distinction lies between *abstract* and *concrete* ideas. A **concrete** idea expresses a subject, *e. g.*, 'this gold,' 'some men,' 'all flowers'; or a quality as belonging to a subject, *e. g.*, 'heavy,' 'virtuous,' 'fragrant.' An **abstract** idea expresses a quality by itself, drawn forth, as it were (*abstraho*, I draw away), from the subject to be separately considered, *e. g.*, 'heaviness,' 'virtue,' 'fragrancy.'

12. A second distinction exists between *singular*, *particular*, and *universal* ideas. An idea is **singular** if it expresses a definite single object, *e. g.*, 'this book,' 'that army,' 'that gold,' 'James,' 'the Angel Gabriel,' 'the United States,' meaning this one country.

An idea is **particular** if it represents one or more objects without determining which, *e. g.*, 'a man,' 'an army,' 'a Nero,' 'a spirit,' 'three books,' 'some states.'

An idea is **universal** when it expresses a note or notes common to many objects, found in each of them, no matter how much those objects may differ in other respects; *e. g.*, 'animal' and 'rational' are notes common to all men; they are conceived in the universal idea 'man,' and each of them corresponds to a universal idea. The term *note* designates anything knowable in an object.

13. All universal ideas can be ranked under five heads, called **the five heads of predicables**, because it is always in one of these five ways that a universal idea is predicated of an object.

1. What is apprehended as common to many objects, found in each of them, and therefore predicable of them all in exactly the same sense, may be the whole nature, the essence of those objects, *i. e.*, all that without which those objects cannot exist nor be conceived. For instance, it is the nature or essence of all men to be 'rational animals'; unless I conceive an

object as being both 'rational' and 'animal,' I do not conceive a man at all. This common essence of a class is called a *species*. The **species**, therefore, is defined as all that constitutes the common nature or essence of a class of objects; *e.g.*, 'man,' 'rational animal.'

2. The universal idea may express a part only of the nature common to many objects. Thus, when I conceive 'animal,' I conceive only a part of man's nature, a part found in other species of objects as well, viz., in brutes. 'Rational' is the other part of man's nature, and it is not found in brutes, but it distinguishes man from the brute. Now, that universal concept which seizes upon what is common to different species is the idea of the **genus**; *e.g.*, 'animal' is the genus, to which belong the two species 'man' and 'brute.'
3. On the other hand, the universal concept which expresses the peculiar note by which one species differs from another species of the same genus is styled the **specific difference**; *e.g.*, 'rational' is the specific difference of the species man as distinguished from the species brute.
4. When the concept expresses something that flows or results so necessarily from the very essence that the essence cannot exist without it, and that note never exists but in such an essence, such note is called a **property** or **attribute** of that essence. Thus, 'the power of laughing,' 'the power to express one's thoughts by articulate speech,' cannot be found but in a being that is both animal and rational, and they result as natural consequences from its compound nature. The use of them may be accidentally im-

peded, as is that of reason itself in the infant and the idiot; but they belong to human nature as such, as distinct from other natures, and are therefore properties of man, proper or peculiar to man. Properties need not be conceived in order to apprehend the nature from which they flow; thus, to conceive man, I need not think of his risible power.

5. Lastly, the universal may express what is found in one or many individuals of a class, or even perhaps in all of them, yet in such a way that it could be absent without the individuals' ceasing to be of the same nature. In that case it expresses an **accident** of the species. For instance, a man may be white or black, tall or small, gentle or fierce, young or old, a European or an American; all these are accidental notes of man. All men are larger than ducks; and yet, if a dwarf should be born, who, when full-grown, should not be so large, being nevertheless a rational animal, he would be truly a man, his particular size being only an accident, not a property of his essence.

14. When we conceive a note common to two or more genera, *e.g.*, 'living,' which note belongs to animals and to plants alike, we have then a **higher genus**, of which the former genera may be considered as the species. 'Body' expresses a still higher genus; for it is predicated not only of living but also of non-living substances, such as stones and metals. 'Substance' itself is the **highest genus**, to which not only bodies but also spirits belong.

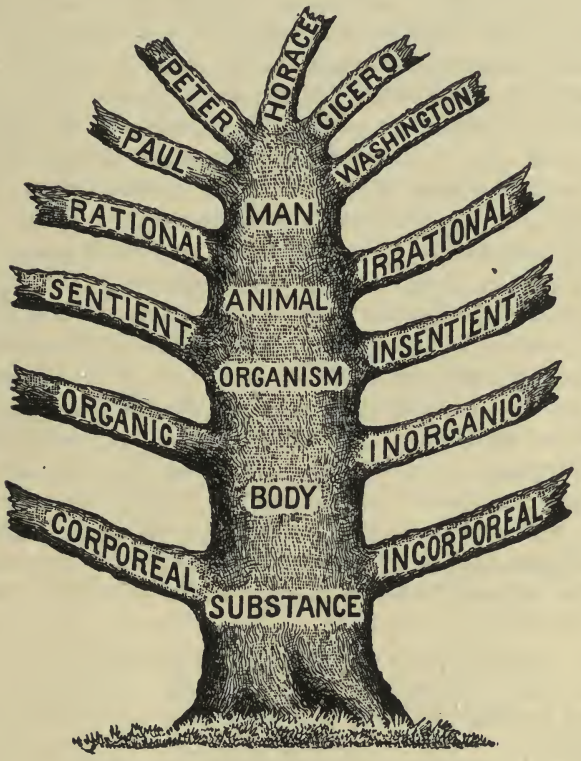
Reversing the process, we may start with the highest genus, say 'substance,' and call 'material' and 'immaterial' substances, or 'body' and 'spirit,' its species. The species 'body' becomes next a **subordinate** genus, of which 'living,' or 'organic,' and 'inorganic' will be the two species. Of

'organisms,' as a new subordinate genus, the species will be 'sentient' and 'non-sentient,' 'animals' and 'plants.' Of 'animals' we have two species, 'rational' and 'irrational,' 'man' and 'brute.' We have various species of 'brutes,' but not of 'man'; for, while brutes have very different natures or essences, and, flowing from these, very different properties, all men have the same essence and the same properties; these differ not in kind but in accidental degrees of perfection. Therefore 'man' is not a genus, but the **lowest species**; 'animal' is his proximate or **lowest genus.** The genera and species between the highest and the lowest are called *subaltern*, *subordinate*, or *intermediate.*

15. This ramification of a highest genus into subaltern genera and species is presented to the eye in the **Porphyrian** tree. The trunk of the tree contains the genera and the species, the branches the specific differences, the top exhibits individuals. (See page 17.)

16. In connection with universal ideas we must explain, as matters of the very highest importance in Logic, the *comprehension* and the *extension* of an idea. **Comprehension** means the total signification, all the notes comprehended or contained in an idea; thus, the concept 'man' comprehends the notes 'animal' and 'rational'; 'animal' itself means 'sentient, living, material substance.'

Extension means the total number of individuals to which the idea extends or applies; the extension of the concept 'man' is all men, that of 'animal' is wider still, extending to all men and all brutes. It is thus apparent that *the greater the comprehension of an idea is, the less is its extension*, and *vice versa;* because the more numerous the qualities apprehended, the fewer the individuals that will possess them all; thus, the genus 'animal' has more extension but less comprehension than the species 'man.' 'Animal' has more



I. e., substance is corporeal or incorporeal; corporeal substance, called matter or body, is organic or inorganic; an organic body or organism is sentient or insentient, etc.

THE PORPHYRIAN TREE.

extension than 'man,' because there are more animals than men; it has less comprehension, because the term 'animal' signifies fewer notes than 'rational animal' or 'man.'

When a term is taken in its full or widest extension, it is said to be **distributed**; it denotes then every one of the objects to which it can apply. Thus, when we say 'all men are creatures,' we mean 'every man is a creature.' Terms expressing particular ideas (No. 12) are **undistributed**; *e. g.*, 'gold is found in California'—*i. e.*, 'some gold.'

A distributed term is applied to all its objects in exactly the same meaning or acceptation. Now, many words are capable of two or three different acceptations: 1. When the meaning of a word is exactly the same, the term is called **univocal**; as when we give the name of 'box' to a case or receptacle of any size or shape. 2. When the meanings are entirely different, without any connection between them, the term is styled **equivocal**; as when the word 'box' is applied, now to a case, then to a blow on the head. 3. When the meanings are different but connected with one another, the term is **analogous**; thus the same word 'box' may stand for a case and for the wood out of which cases used often to be made, the box-tree.

Article III. Judgments and Propositions.

17. A **judgment** may be defined as *an act of the mind affirming or denying the agreement of two objective ideas.* The mind in judging compares two ideas, and consequently the objects represented by those ideas, and affirms or denies that they agree with one another; *e. g.*, 'modesty is praiseworthy,' 'ebriety is not worthy of man.' If, as in these examples, the agreement or disagreement is seen to exist by the mere consideration or analysis of the ideas compared, the judgment is **analytic**; it is also styled *a priori, i. e.*,

formed antecedently to experience; or *pure, i. e.*, formed by pure reason, not learned by sense-perception; or again, it may be called *necessary*, *absolute*, or *metaphysical*, according to the obvious meanings of those terms. But if the agreement or disagreement is discovered consequently on experience, *e. g.*, 'gold is malleable,' the judgment receives the opposite appellations of **synthetic**, *a posteriori*, *experimental*, *contingent*, *conditional*, and *physical*.

18. If a judgment of either kind is arrived at by reasoning, it is **mediately evident**; if the agreement or disagreement is seen without the aid of reasoning, the judgment is **immediately evident**. That 'ice is cold,' is an immediate *a posteriori* judgment; that 'there is nothing without a reason for it,' is immediately known *a priori*; that 'the sum of the angles of a triangle is equal to two right angles,' is known mediately *a priori*; the physical laws are known mediately *a posteriori*.

19. A judgment expressed in words is called a **proposition**. The subject and predicate together are its **matter**, and the affirmation or negation its **form**; the **copula** is always the verb 'to be' in the present indicative, expressed or implied: 'I see' is equivalent to 'I am seeing,' 'He said' to 'He is one who said,' etc.

That a proposition be **negative**, it is necessary that a negative word affect the copula. Now, it often requires some reflection to see what word is intended to be affected by the negation: 'No criminal is a happy man' means 'A criminal *is not* a happy man'; 'A tyrant has no peace' means 'A tyrant *is not* one having peace.'

20. In propositions it is of the highest importance for correct reasoning that we carefully attend to the *extension* and the *comprehension* of the terms used and of the ideas for which they stand.

I. If we consider **the extension of the subject**, a proposition is styled *singular*, *particular*, or *universal*, according as its subject expresses a singular, particular, or universal idea (No. 12). The form of the term expressing that idea may be misleading, the meaning must be carefully considered. Thus, 'a man is a creature,' 'man is a creature,' 'all men are creatures,' 'every man is a creature,' 'no man is necessary,' are all universal propositions; while 'a man was slain' is particular (for here 'a man' means, not every man, but 'some one man'), and 'that man is generous' is a singular proposition.

II. If we consider **the extension and the comprehension of the predicate**, we have the following rules:

1. *In an affirmative proposition the predicate is taken in its full comprehension, but not* (*except in definitions*) *in its full extension.* For instance, 'gold is a metal' means that gold has all the notes constituting a metal, but not that it is every metal. We say 'except in definitions,' for in these the defining words, which are the predicate, must have the same extension as the thing defined, expressed in the subject; *e. g.*, 'man is a rational animal,' *i. e.*, 'any rational animal.'
2. *In a negative proposition the reverse holds true, i. e., the predicate is taken in its full extension, but not in its full comprehension.* For instance, 'a diamond is not a metal' denies that the diamond is contained in the whole class of metals; but it does not deny that it has qualities in common with metals, since it is a substance, material, lustrous, etc., as well as metals. The extension of the subject determines the **quantity** of a proposition; its **quality** depends on its form, *i. e.*, on its being affirmative or negative.

21. In reasoning we must distinguish between *hypothetical* and *categorical* propositions.

The **hypothetical** proposition does not affirm or deny the agreement of subject and predicate absolutely, but dependently on some supposition or condition, or with a possible alternative. It is distinguished from the **categorical,** which directly affirms or denies the agreement between a subject and a predicate without any condition or alternative.

The hypothetical may be of *three kinds:*

(*a*) The **conditional,** consisting of two parts, one of which is declared to be the condition of the other. The part expressing the condition is called the *condition* or *antecedent,* the other the *conditioned* or *consequent.* If the connection is true, the proposition is true. Thus, 'If you knew God well, you would love him,' is certainly true; 'If you get old, you will be wise,' may be false.

(*b*) The **disjunctive,** which connects incompatible clauses by the disjunctive particle 'or'; as, 'A being is either created or uncreated.' The proposition is true, if it leaves no alternative unmentioned.

(*c*) The **conjunctive,** which denies that two things can exist, or hold true, at the same time; as, 'A being cannot be created and independent.'

CHAPTER II.

REASONING.

22. **Reasoning** is the mental act or process of deriving judgments, called conclusions, from other judgments, called premises.

The principle underlying all valid reasoning is that the conclusion is implicitly contained in the premises; therefore whoever grants the truth of the premises thereby really grants the truth of the conclusion. For instance, in this reasoning, "Every good son is pleased to see his mother honored; but Christ is a good Son; therefore He is pleased to see His Mother honored," whoever grants the first two propositions must grant the third, since it is contained in them.

Reasoning is styled *pure*, if the judgments are analytic judgments; *empiric*, if they are synthetic, and *mixed*, if one premise is analytic and the other synthetic. Reasoning expressed in words is called **argumentation.**

Article I. The Categorical Syllogism.

23. All argumentation may be reduced to the *categorical syllogism*. A **syllogism** is an argument consisting of three propositions so connected that from the first two the third follows. If all the propositions are categorical, the syllogism is categorical. It will be remembered that a proposition is called **categorical** if it affirms or denies absolutely the agreement of a subject with a predicate. (No. 21.) "All virtues are desirable; but sobriety is a virtue; therefore sobriety is

desirable," is a categorical syllogism. This conclusion, "Sobriety is desirable," is implicitly contained in the first or major premise, "All virtue is desirable"; and the second or minor premise, "Sobriety is a virtue," points out the fact that it is therein contained. Such reasoning is, therefore, perfectly valid.

§ 1. *Constructing Syllogisms.*

24. **To prove a thesis by a syllogism** we begin by finding a proposition which really involves the truth of the thesis, and in a second proposition we state that it does so. Thus, if I am to prove that every one must honor his father and mother, I may start with the premise, "Every one must do what God commands"; I add the minor premise, "But God commands to honor father and mother." Hence I legitimately draw the conclusion, "Therefore every one must honor his father and mother."

25. We must next examine in what ways premises may contain conclusions. **If the major is a universal proposition, it may contain the conclusion in four different ways:**

1. The proposition being universal, the subject is distributed or taken in its widest extension; thus, "Every stone is matter," means that the predicate 'matter' applies to everything that is a 'stone.' If, therefore, the minor states that something, say 'marble,' is a stone, the conclusion will follow that marble is matter. Thus *the major affirms that a predicate belongs to a whole class; the minor affirms that a certain thing is of that class; the conclusion affirms that the same predicate belongs to that certain thing.*
2. Similarly, if the major is negative, as, "A stone is not a spirit," and the minor declares that "Marble is a stone of some kind," the conclusion will be that "Marble is not a spirit." That is: *the major*

denies a predicate of a whole class; the minor affirms that a certain being is of that class; the conclusion denies that same predicate of that same being.

3. A third form reasons thus: *The major denies a predicate of a whole class; the minor affirms that a certain being has that predicate; the conclusion denies that said being is of said class;* for if it were of that class, it would not have that predicate. Thus, "A stone is not a spirit; but an Angel is a spirit; therefore an Angel is not a stone."
4. In the three cases just explained the minor is affirmative. A fourth form of syllogism arises if *the major affirms some predicate of a whole class, and the minor denies that a certain being has that predicate; the conclusion will then be that said being does not belong to said class;* since all the individuals of that class have been affirmed to possess that predicate. "Every stone is matter; an Angel is not matter; therefore an Angel is not a stone."

In these four forms the major is a universal proposition, and the reasoning is founded upon the wide extension of the subject. The major need not be universal in the **fifth form,** which derives its validity from the full **comprehension of the predicate.**

5. The fifth form reasons thus: *The major affirms that a being has a certain predicate, i. e.,* that it has all the notes comprehended in that predicate; *the minor affirms that a certain note is comprehended in that predicate; the conclusion affirms that said being has said note.* Thus, "This stone is matter; but all matter is extended; therefore this stone is extended." By changing the order of the premises, this fifth form is reducible to the first.

26. The **first and second of these five forms** are the most obvious modes of argumentation and the most constantly used. The reasoning so familiar in Mathematics, A=B, B=C, ∴ A=C, is an application of the first form. The argument, if expressed in full, would read thus: "Any two things equal to a third thing are equal to each other; but A and C are equal to a third, B; therefore they are equal to each other." Similarly, from the second form we have the following reasoning: "Two things, one of which is equal to a third thing and the other unequal, are not equal to each other; but A is equal to B, and C is not equal to B; therefore A is not equal to C.

27. In these two special modes of reasoning the major propositions are usually suppressed, because they are so obvious; and the arguments assume an **abridged form,** so constantly in use and so practically useful, that we must explain it with special care. In fact, many logicians reduce all syllogisms to these two abridged forms, which they call the *affirmative* and the *negative syllogism.*

28. The **affirmative syllogism,** *i. e.*, that in which both the premises are affirmative, is based on the principle that *two things equal to a third are equal to each other:* A=B, B=C; therefore A=C

The **negative syllogism,** *i. e.*, that in which one premise is negative, is based on the principle that *two things, one of which is equal and the other unequal to a third, are unequal to each other:* A=B; B is not equal to C; therefore A is not equal to C.

29. The purpose of comparing A with B, and B with C, in the premises is to bring A and C together in the conclusion, as equal or unequal to each other. A and C are to be brought together; they are therefore called the **extreme terms,** and B, which brings them together, is **the middle**

term. The subject of the conclusion is styled the *minor extreme;* its predicate, the *major extreme.* The premise containing the major extreme is the *major premise,* and that containing the minor extreme is the *minor premise;* still, practically the first expressed is usually called the major, and the second the minor premise. All the propositions together are the **matter** of the syllogism; the proper connection between them is its **form** or **sequence,** a term not to be confounded with consequent or conclusion.

30. **A syllogism is valid** when both the matter and the form are without a flaw. The following is materially true, formally false: "All virtue is good; intemperance is not a virtue; therefore intemperance is not good." The following is materially false, formally true: "Gloomy things are hateful; but virtue is a gloomy thing; therefore virtue is hateful."*

§ 2. *Criticising Syllogisms.*

31. In the mathematical formula, A=B, B=C, ∴A=C, there is no danger of error; but when we substitute ideas for the letters, there is need of great care to avoid mistakes. Thus, suppose that for A I substitute "silver," for B "a certain metal," for C "yellow," and instead of the formulas, A=B, B=C, ∴ A=C I write: "Silver is a certain metal; but a certain metal is yellow; therefore silver is yellow," the conclusion is not legitimate; for 'a certain metal' is taken in two different significations, and consequently 'silver' and 'yellow' are not compared to one thing, but to different things. To

*Exercises like the following will be found to be of great advantage: Construct syllogisms proving the following theses: The Saints deserve to be honored, No man is to be hated by his fellow-man, Theft should be punished, Good books are valuable treasures, Bad books are injurious, Riches are not lasting possessions, The study of music should be encouraged, Jealousy cannot please God, No time is useless.

avoid and to discover errors in syllogistic reasoning, the following **eight rules** must be applied:

1. The terms are only three, to this attend;
2. Nor let the consequent a term extend.
3. Conclusions ne'er the middle term admit;
4. At least one premise must distribute it.
5. Two negatives no consequent can show,
6. From affirmations no negations flow.
7. A universal premise you'll provide,
8. And let conclusions take the weaker side.

32. *Rule* 1. *The terms are only three, to this attend.* There must be three terms, representing three ideas, and only three terms and ideas; this is the most important rule of all: it virtually contains most of the other rules. We evidently need three terms, that two things may be compared with a third; and, as each term must occur twice, there is no room for a fourth term. This rule is often violated by using one of the terms in two different meanings, especially the middle term; as:

Chewing is a bad habit;
But *chewing* is necessary to man;
Therefore a bad habit is necessary to man.

Rule 2. *Nor let the consequent a term extend.* Let no term have a wider meaning in the conclusion than in the premises; else there would really be more in the conclusion than is contained in the premises; as:

You are not what I am;
I am a *man;*
Therefore you are not a *man.*

'A man' is distributed in the consequent; for it stands for 'any man at all,' 'you are not any man at all'; but 'man' is particular in the minor; it means 'a certain man,' 'some man.'

Rule 3. *Conclusions ne'er the middle term admit.* This rule is evident, as the conclusion has nothing to do but to compare the extremes. We could not argue:

> Lincoln was President;
> Lincoln was of Illinois;
> Therefore *Lincoln* was President of Illinois.

Rule 4. *At least one premise must distribute it.* The middle term must be used in its widest meaning in at least one of the premises. If the middle term were taken twice in a particular meaning, it might denote different objects; as:

> *Some monks* were very learned;
> Luther was a *monk;*
> Therefore Luther was very learned.

Notice that a *singular term* is taken in its widest meaning, as 'Cicero,' 'Columbus,' 'the Eternal City,' etc.; *e. g.*, "Columbus discovered America; but Columbus was disgraced; therefore the discoverer of America was disgraced."

Rule 5. *Two negatives no consequent can show.* From the fact that two things are not equal to a third, it does not follow that they are equal to each other, nor that they are unequal.

Rule 6. *From affirmations no negations flow.* If the two premises are affirmative, they declare that two things are equal to a third; whence it follows that they are equal, not unequal, to each other.

Rule 7. *A universal premise you'll provide.* If both premises are particular, no conclusion will follow. For their subjects are particular (No. 20), and if both are affirmative, their predicates are particular (No. 20); thus all their terms are particular, and the middle term is not distributed as it should be by Rule 4. If one is negative, its predicate is distributed (No. 20), but that is not enough; we need then

two universal terms, one for the middle term and one for the predicate of the conclusion. For that conclusion will be negative (Rule 8), and therefore must have a universal predicate (No. 20). We cannot reason thus:

> Some Inquisitors were cruel;
> Some good men were Inquisitors;
> Therefore some good men were cruel.

Rule 8. *And let conclusions take the weaker side.* The meaning is that, if one of the premises is negative, the conclusion is negative; if one is particular, the conclusion is particular. The first assertion is evident: it regards the negative syllogism explained above (No. 28). As to the second, if one premise is particular, two cases may occur: 1. If both are affirmative, they can contain only one distributed term, since one subject and both predicates are particular. The distributed term must, of course, be their middle term, for the middle term must be at least once distributed; and therefore the subject of the conclusion must be particular. 2. If one premise is negative, there may be two distributed terms in the premises, viz., the subject of the universal proposition, and the predicate of the negative—one of these is needed for the middle term, and one for the predicate of the negative conclusion; thus the subject of the conclusion will again be particular.*

33. These same rules apply to all syllogisms having

* **Exercise.** Criticise the following syllogisms:

1. "The beings conjured up by spiritists are spirits;
   But the souls of the dead are spirits;
   Therefore the beings conjured up by spiritists are the souls of the dead."
2. "Blessed are the poor in spirit;
   The Apostles are blessed;
   Therefore the Apostles are poor in spirit."
3. "Scientists deal with physical laws;
   But Huxley and Darwin are scientists;
   Therefore they deal with nothing but physical laws."

LIBRARY OF THE

categorical premises, even though the premises be **compound** propositions. The rules may seem at first sight to be violated, but they will be found, on careful inspection, to be observed in all correct reasoning of this kind. Attend especially to that part of the compound premises in which the stress of the argument lies. Thus, when we say, "God alone is *eternal*, but Angels are not God; therefore they are not *eternal*," the term 'eternal' is distributed in the conclusion, while it seems to be the predicate of an affirmative proposition in the major premise. But the major is compound, and contains a negative part, "Whatever is not God is not eternal." Hence the rule is not violated.

Article II. The Hypothetical Syllogism.

34. **A hypothetical syllogism** is one whose major is a hypothetical proposition (No. 21); and such it always is when the syllogism is not categorical. We have seen that there are three kinds of hypothetical propositions: the *conditional*, the *disjunctive*, and the *conjunctive*. Hence there are three species of hypothetical syllogisms.

35. I. **Conditional** syllogisms derive their force from an affirmed connection between a condition and a consequent; so that, if a certain condition is verified, a certain consequent must be admitted. Therefore, if the consequent does not exist, the condition is thereby known not to be verified. Hence this argument may validly conclude in two ways:

4. "Monopolists are rich;
Some rich men are proud;
Therefore monopolists are proud."

5. "Many men are rich:
Many men oppress the poor;
Therefore the rich oppress the poor."

6. "The free-traders wish to reduce the tariff;
Mr. C. wishes to reduce the tariff:
Therefore Mr. C. is a free-trader."

1. *Affirmatively: The condition being affirmed, the consequent must be affirmed;* but not *vice versa.* Thus we say rightly:

> "If the sun shines, it is day;
> But the sun shines;
> Therefore it is day."

But if the minor were "It is day," it would not follow that the sun shines. Or, 2. *Negatively: The consequent being denied, the condition must be denied;* but not *vice versa.*

> "If the sun shines, it is day;
> But it is not day;
> Therefore the sun does not shine."

If the minor were "The sun does not shine," it would not follow that it is not day.

These and all other conditional syllogisms can be reduced to the categorical form. For instance, we can reason thus:

> "All times of sunshine are day;
> But this is a time of sunshine;
> Therefore it is day."

36. II. The **disjunctive** syllogism has a disjunctive major premise; *e. g.*, "Either the father, or the mother, or the child is the natural head of the family." It is supposed that the disjunction is complete, *i. e.*, that no fourth alternative is possible. From this major we may reason in three ways:

1. *The minor may deny one member of the disjunction, and the conclusion affirm the other members disjunctively.*

> "But the child is not the natural head of the family;
> Therefore either the father or the mother is such."

2. *The minor may affirm one of the members, the conclusion deny the other members copulatively:*

> "But the father is the natural head;
> Therefore neither the mother nor the child is such."

3. *The minor may deny all the members but one, the conclusion affirm that one:*

"But the mother and the child are not;
Therefore the father is."

37. III. The **conjunctive** syllogism has a conjunctive major premise; as: "No one can love God and hate his neighbor." From this premise we can reason validly by affirming one of the incompatible predicates in the minor, and denying the other in the conclusion: "But the Martyrs loved God; therefore they did not hate their neighbor," or "But Nero hated his neighbor, therefore he did not love God."

Article III. Other Species of Demonstrative Arguments.

38. 1. The **Enthymeme**, as now usually understood,* is an elliptical syllogism, one of the premises being understood (ἐν θυμῷ, in the mind); *e. g.*, "The world displays a wonderful adaptation of means to an end; therefore it is the work of an intelligent Maker." The major is understood, viz., "Whatever displays a wonderful adaptation of means to an end is the work of an intelligent maker." To **criticise** the validity of an enthymeme we have only to supply the omitted premise, and then apply the ordinary rules of the syllogism.

39. 2. The **sorites** (σωρός, a heap) is an abridged series of syllogisms; it is an argument consisting of more than three propositions so connected that the predicate of the first becomes the subject of the second, the predicate of the second the subject of the third, etc., till the conclusion joins the subject of the first with the predicate of the last premise. "Man is accountable; whoever is accountable is free; whoever is free is intelligent; whoever is intelligent cannot be mere matter; therefore man cannot be mere matter."

* The word was differently derived and explained by Aristotle.

40. **To test such reasoning,** it should be resolved into connected syllogisms, thus:

"Whoever is accountable is free; but man is accountable; therefore man is free."

"Whoever is free is intelligent; but man is free; therefore man is intelligent."

"Whoever is intelligent cannot be mere matter; but man is intelligent; therefore man cannot be mere matter."

41. 3. The **dilemma** (δις-λῆμμα, a twofold assumption) is an argument which offers an adversary the choice between two or more alternatives, from each of which a conclusion is drawn against his position. The alternatives are called the *horns* of the dilemma. Such was the reasoning of one whom a Protestant parent was preventing from becoming a Catholic. He answered: "Either Protestantism or Catholicity is right. If Protestantism is right, every one must be guided by his own judgment in religious matters, and you should not prevent me from judging for myself. If Catholicity is right, you ought not only not to prevent me, but even to follow my example."

42. To be **conclusive,** the dilemma must leave no escape from the alternatives presented; thus, the dilemma just quoted would not be conclusive against a Pagan; for he would deny the major. Besides, the partial inferences must follow strictly from their respective premises; else the argument may often be retorted. A young man, striving to dissuade his sister from devoting herself to the exclusive pursuit of holiness, argued thus: "Either you have still a long or but a short life before you: if a long life, you will forego countless pleasures; if a short life, you cannot get far on the path of holiness." She retorted: "If a short life, I shall forego few pleasures; if a long one, I can get far on the path of holiness."

43. 4. When proofs of the premises or of one of them are inserted in a syllogism, the argument is called an **epichirema** (ἐπὶ χείρ, at hand, ready for use), which is rather an oratorical form of the syllogism than a distinct species of reasoning; *e. g.*, "Education should promote morality; but it fails to do so when severed from religious teachings, since morality derives all its force from religious convictions; therefore education should be religious."

44. 5. **Induction** requires careful consideration, on account of its constant application to the Physical Sciences. It follows a process the reverse of the syllogistic; for it argues not from universals to particulars, but from particulars to universals. It may be defined as an argument in which we conclude that what is found by experience to hold true of single objects of a class holds true of the whole class. Induction may be *complete* or *incomplete*.

45. **Complete induction** examines every single object of a class, and then enunciates universally that all the class has certain properties; for instance, after exploring every zone of the earth, we may conclude, "All the zones of the earth's surface are capable of supporting human life." Complete induction rests for its validity on this **syllogism**: "Whatever is true of every individual of a class is true of the whole class; but a certain proposition is true of every individual of a class; therefore it may be predicated of the whole class."

46. **Incomplete induction,** the ordinary process of Physical studies, does not examine every single object of a class, but a sufficient number of such objects, and under sufficiently varied circumstances, to make it certain that the property or action observed cannot be owing to any accidental cause, but must be due to the very nature of the objects, and therefore must always accompany them, even in such cases as have not been examined. As long as any doubt remains whether, perhaps,

the peculiarity constantly observed may not be owing to some accidental circumstances, induction cannot give truly scientific certainty; but when all such doubt is excluded, the argument is conclusive. It rests then upon this clear **syllogistic reasoning**: "Whatever property or action flows from the very nature of objects must always accompany those objects; but a certain property or action is known by a sufficient variety of experiments to flow from the very nature of certain objects; therefore it must always accompany them." For instance, heavy bodies when left unsupported have been found in most varied circumstances to fall to the earth, and therefore we judge without fear of error that this tendency must be due to their very nature, and we formulate the natural law: "Heavy bodies when unsupported fall to the earth."

47. The only **danger** is that scientists, in their eagerness to formulate general laws, will not always examine a sufficient variety of cases to exclude all doubt as to the real cause of the phenomena observed. Thus, Laplace laid it down as a natural law that all the parts of the solar system revolve from west to east; while it is now known that some of the solar planets and their satellites perform motions in the opposite direction.

48. It is evident that no conclusion is **valid**, except in as far as it is contained in the premises from which it is derived. Therefore the fact that an assertion is found to hold in ninety-nine cases is no certain proof that it will hold true in the hundredth case, since this hundredth case is not contained in the cases observed. Incomplete induction, therefore, cannot by itself, without resting on a syllogism, furnish a scientific proof. But we have scientific proofs of many things. Hence it is evident that Materialists and Positivists (*i. e.*, those pretended philosophers who admit nothing but matter and sensible phenomena) are entirely mistaken when they teach that the

mind has no knowledge of any universal propositions whatever, except as far as it has observed and generalized individual facts; that all reasoning, therefore, is only the generalizing of facts, or that all the elements of our knowledge are only inductive, without any universal proposition on which their certainty rests. Some of these philosophers maintain that we do not even know that a circle must be round, but only that it is always known to be so on this earth, while elsewhere it may, for all we know, be square. But the proposition, "A circle is round," is self-evident, independently of observation and induction. A system is known to be false if it leads logically to absurd consequences, as their system does.

Article IV. Probable Reasoning.

49. In all the forms of argumentation so far explained, the process is every way reliable and the conclusion certain; such reasoning is called **demonstrative**; to distinguish it from **probable** reasoning, which fails to remove all prudent fear of error.

A syllogism one or both of whose premises are only probable will, of course, yield only a probable conclusion; it is called **dialectic**, *i. e.*, open to discussion (*διαλέγομαι*, I discuss). We shall here consider two important species of probable arguments, *Analogy* and *Hypothesis*, both of frequent application, chiefly in the Physical Sciences.

50. I. **Analogy** (*ἀνάλογος*, parallel reasoning) is an argument by which we conclude that a certain line of reasoning will hold in one case because it is known to hold in a similar case. Thus, because we see that the actions of brutes are to a great extent similar to those of men, and in men they are prompted by certain feelings, we conclude, with very strong probability, that in brutes also they are prompted by similar feelings.

51. **The principles underlying analogical reasonings** are such as these: "Similar causes are apt to produce similar effects," "Similar properties suggest similar essences," "Things similarly constructed appear to be governed by similar laws," etc. Sometimes the probability thus obtained is very strong; at other times the argument is deceptive, because, though alike in many other ways, the two cases may differ on the very point in question. Such are many of the analogies urged in support of the Evolution of Species. "The vile grub is evolved into a beautiful butterfly; why may not a hawk be developed into an eagle?" asks the popular scientist. But from the egg of the butterfly comes the vile grub again, and the species remains ever the same. Varieties of type within the same species of animals are numberless, but no single case of an evolution from one species into another has ever been scientifically established.

52. The argument of analogy is more **useful** to the orator than to the philosopher. It supplies the former with the topics of Similitude and Example. It suggests much effective reasoning *a majori*, *a minori*, and *a pari*.

In scientific investigations analogy is often suggestive of solutions, which may afterwards be proved demonstratively to be correct; till they are so proved, they are called *hypotheses*.

53. II. An **hypothesis** (ὑπόθεσις, a supposition) is a proposition provisionally assumed as if true, because it accounts plausibly for many facts. For instance, it was formerly supposed that light consisted of particles emitted by luminous bodies; the present hypothesis explains the phenomena of light more plausibly by the vibrations or undulations of ether. When an hypothesis is so far confirmed by experience that it leaves no reasonable doubt as to its correctness, it ceases to be an hypothesis and becomes a *thesis*.

That an hypothesis may be probable and truly **scientific**,

it is necessary: 1. That it explain a considerable portion of the facts in question. 2. That it do not certainly contradict any well-established truth; for, as two contradictories cannot both be true, whatever hypothesis contravenes a well-established truth is thereby known to be false. Numerous important discoveries have been made, especially in the Physical Sciences, by means of ingenious hypotheses. On the other hand, science has often been much retarded by false hypotheses, which led investigations into wrong directions. To point out such false assumptions is to render most important services to the cause of progress. For one Copernican theory retarded a while till supported by stronger proofs, numerous wild vagaries have been discountenanced by the Roman tribunals, and the energies of the learned diverted from wasting themselves in the pursuit of idle fancies.

Article V. Indirect Reasoning.

54. Reasoning, whether demonstrative or probable, is styled **indirect** when, instead of proving the thesis, it simply aims at clearing away objections against it, or at establishing some other proposition from which the truth of the thesis may be inferred. Indirect reasoning may assume various forms:

1. The **self-contradiction**, or *reductio ad absurdum*, is a form of argument showing that the denial of the theses leads to absurd consequences; thus we argue the necessity of admitting certainty from the fact that the denial of all certainty leads a man to stultify himself.
2. The **negative argument** points out the absence of all proof from an opponent's assertions. "Mere assertions go for nothing," "*Quod gratis asseritur gratis negatur*," are received axioms of discussion.
3. The **instance** or **example** adduces a test case in

which the assertion or the reasoning of an opponent is shown to be at fault. Thus, if one asserted that all history is unreliable, we might instance our Declaration of Independence as an undeniable fact of history.

4. An **argumentum ad hominem** draws from an opponent's principles, true or false, a conclusion against him; *e. g.*, when a Fatalist philosopher was about to flog his slave for the crime of theft, the latter argued that he could not be justly punished for a crime which he was *fated* to commit.
5. A **retort** turns an adversary's argument or some portion of it against himself; as when the same philosopher answered that he likewise was *fated* to flog the slave.
6. We **evade** an argument when, without discussing his proofs, we call on an adversary to explain what he is unwilling or unable to explain; thus many a specious theorizer is silenced by summoning him to explain the consequences of his theories.
7. The argument **ad ignorantiam** shows that an opponent is unable to prove his point or answer our objections.
8. The argument **ad invidiam** makes an adversary's thesis or his proofs odious or ridiculous.

55. In **answering objections** we should attend with special care to distinguish what is true from what is false in the arguments of our opponents.

Most objections contain some element of truth; for falsity, as such, is not plausible: it is the truth blended with falsity that gives plausibility to an objection. To separate the one from the other, by drawing clear lines of demarcation, is the keenest test of logical skill, and the direct road to complete victory. To facilitate for the student this task of neatly dis-

tinguishing the true from the false, we shall now point out the chief forms which fallacious arguments are apt to assume.

Article VI. Sophisms or Fallacies.

56. A **sophism** or **fallacy** is an argument which, under the specious appearance of truth, leads to a false conclusion. The deception is caused either by some *ambiguity in the expression*, or by some *confusion in the thoughts expressed.*

57. I. The fallacies arising from **ambiguity in the expression** are chiefly two:

1. The **equivocation,** or **ambiguous middle,** uses a middle term in two different meanings; *e. g.*, "The soul is immortal; but a brute animal has a soul; therefore a brute animal has something immortal." We answer by distinguishing the two meanings of the word 'soul.' In the major it denotes the human soul, in the minor the principle of life in any animal: there are four terms.
2. The fallacy of **composition and division** confounds what holds of things separate with what holds of them united; *e. g.*, "It is absolutely impossible that the dead should live" is true in the sense that they cannot live and be dead at the same time, *i. e.*, in the sense of *composition;* but it is not true in the sense of *division:* those now dead can, by the power of God, be made to live again.

58. II. Fallacies result from **confusion of thought** in six ways, chiefly:

1. The fallacy of the **accident** confounds an essential with an accidental property; *e. g.*, "We buy raw meat, and we eat what we buy; therefore we eat raw meat."

What we eat has the same essence as what we buy, but not the same accident of rawness.

2. What is true in the proper sense of the word, '*simpliciter*,' is often confounded with what is true in a qualified sense or **under a certain respect** (*secundum quid*); *e. g.*, "A sea-captain who willingly throws his cargo overboard ought to indemnify the owner; but A did so; hence A ought to indemnify the owner." The major would be true, if the captain were absolutely willing to destroy the cargo entrusted to him; but not if he is willing in a way only, *i. e.*, as a necessary means to save vessel and crew.

3. An **irrelevant conclusion,** *ignoratio elenchi*, or *missing the point*, proves what is not in question, refutes what is not objected; as when Evolutionists prove elaborately that the body of man resembles in various ways the bodies of brutes—a fact which no sensible man denies.

4. The *petitio principii*, or **begging the question,** consists in taking for granted the point which is to be proved; when this very point is used as a premise in the reasoning, the fallacy is called a **vicious circle.**

5. The fallacy of the **false consequence,** often called a *non-sequitur*, or want of sequence, is used when a conclusion is drawn which is not contained in the premises; *e. g.*, "There exists a wonderful gradation in the perfection of plants and animals; therefore the more perfect are evolved from the less perfect."

6. The **undue assumption,** or false cause, *non causa pro causa*, assumes as a cause what is not a cause; as when the Reformation is assumed to be the cause of scientific progress. This fallacy often arises from

the fact that mere priority in time is mistaken for causality; *post hoc; ergo propter hoc.**

Article VII. Method in Reasoning.

59. **Order** is a proper arrangement of parts for any purpose whatever, theoretical or practical; **method** is a suitable arrangement of parts with a view to a practical end. In reasoning, the end is the acquisition or the communication of knowledge.

60. All reasoning must **begin with undoubted premises,** which themselves need not to be supported by reasoning: no science is expected to prove its first principles. Thus, Geometry starts out with a number of axioms, from which the whole science is derived by logical reasoning. Such axioms are not blindly or arbitrarily taken for granted; but they are self-evident, they need no proof. Thus, too, in Philosophy the first principles are self-evident and need no proof.

61. As the mind must, of course, apprehend the premises before it draws conclusions from them, we say that in the **logical order,** *i. e.*, in the order of thought, the premises are always prior to the conclusions. But in the **ontological order,** *i. e.*, in the order of being, a truth stated in the premises may be really posterior to the truth expressed in the conclusion. Such is the case whenever we reason from an effect to its

* **Exercise.** Point out the fallacies contained in the following arguments:

1. "Liberty is desirable; but the laws restrict liberty; therefore the laws restrict what is desirable."

2. "The liberty of the press is a blessing; but blessings should not be restricted; therefore the liberty of the press should not be restricted."

3. "The Inquisition was the cause of much cruelty; but the Popes approved the Inquisition; therefore the Popes approved the cause of much cruelty."

4. "The Spanish Inquisitors were often cruel; but St. Peter Arbues was a Spanish Inquisitor; therefore the Saints are often cruel."

5. "Galileo was condemned by a Roman tribunal; therefore the Pope is not infallible."

6. "The Supreme Court of the United States is a fallible tribunal; therefore its decisions are not to be regarded."

cause, say from a beautiful picture to the skill of the painter; for the effect is posterior to the cause, is dependent on the cause.

62. Reasoning thus from effect to cause is reasoning **a posteriori,** and, *vice versa*, reasoning from cause to effect is called **a priori,** since causes are ontologically prior to their effects.

63. It will be noticed that the terms *a priori* and *a posteriori* have not exactly the same meaning when applied to reasoning and when applied to judgments. A **judgment a priori,** as explained above (No. 17), is one formed independently of experience, while a **reasoning a priori** is one proceeding from a cause to its effect.

64. While in *a priori* and *a posteriori* reasonings we consider relations between two things, one of which is ontologically prior to the other, in **analytical** and **synthetical** reasonings we consider only one thing, studying the relations between the whole being and its parts, between a substance and its qualities. If we are first acquainted with the whole being and from the study of it strive to discover its parts, we are said to analyze the subject (ἀναλύω, I take apart): we then proceed analytically. But if we know the parts first, and put them together to find the whole, we proceed synthetically (σύνθεσις, a putting together). The chemist analyzes a mineral to discover its simple ingredients; the apothecary combines simples into compounds. The synthetic geometrician puts together lines and angles to find the properties of surfaces and solids; while the analytical geometrician finds the particular mathematical relations implied in a general formula.

65. The metaphysician considers **an idea as a whole,** and the **notes of it as its parts.** For instance, knowing that an oak is a tree, he examines the notes involved in the concept

'tree,' and finds analytically that an oak is a substance, material, vegetable, etc. On the other hand, seeing that the human body is a substance, extended, living, sensitive, he concludes synthetically that it is of an animal nature. Now, it is obvious that the idea analyzed is less extended than the notes; *e. g.*, 'tree' is less extensive than 'substance,' for every tree is a substance, but not every substance is a tree. Therefore, when we reason analytically, we proceed *from the particular to the universal*, and *vice versa* we reason synthetically *from the universal to the particular.*

66. A science may use either **analysis or synthesis,** or now the one and then the other. Thus, in this treatise on Dialectics, while first explaining ideas, next the union of ideas into judgments, then the combination of judgments into arguments, we have used synthesis; and, in analyzing the nature of reasoning to discover the rules that must guide it, we have used analysis. This latter process is, in most studies, better suited for the investigation of truth, synthesis for the imparting of truth to others.

67. While treating of scientific methods, it is proper to speak of the **distinctions existing between various sciences.** These are distinguished according to their objects; thus, Astronomy is evidently distinct from Botany, because it treats of a different class of objects. When sciences treat of the same object, as do Geology, Geometry, and Geography, all of which study the earth, they view that object differently; and the view they take of their objects is called their *formal object*, the object itself being called the *material object.* Sciences are therefore more correctly said to be **specified by their formal objects.** It naturally follows that a science is esteemed as more or less noble in proportion as its formal object is more or less worthy of man. Theology is therefore the noblest of all, since it views all its objects as they are known

by the highest light, viz., by the supernatural light of Divine Revelation. Philosophy is the noblest of the merely human sciences, since its formal object is what is most intellectual in all things, viz., their very essences and their relations to the highest good.

68. The true teachings of any science can never come into **conflict** with the true teachings of any other science; for truth objectively considered is something absolute, not merely relative; it is *that which is*. In the case of an apparent conflict between two sciences, it will always be found that one of the conflicting teachings is not demonstrated nor capable of demonstration.

Article VIII. Exercise in Reasoning.

69. The most useful exercise in philosophic studies is the manner of discussion called **The Circle.** We shall here explain it at some length:

One pupil is appointed to defend on a given day, during about half an hour, any thesis that has been explained in the class; two others are appointed to object; and the whole discussion is to be conducted in strict syllogistic form. The discussion is opened by the first objector, who challenges the defender to prove the thesis. The latter begins by explaining the exact meaning of the thesis; he next gives the proof in a formal syllogism, adding, if necessary, the proof of the major or the minor, or both. The objector then attacks the thesis or its demonstration: he offers a syllogism the conclusion of which is contradictory to the thesis or to the validity of the proof. The defender repeats the objection in the very words of the opponent; next, he replies separately to each of its propositions.

Let us suppose that the third thesis of *Critical Logic*—**the theory of universal scepticism is self-contradictory** (No.

94)—is the subject of discussion. The defender, at the summons of the first objector, explains and proves the thesis. Then the first *objector:* "That is not self-contradictory which does not affirm and deny the same thing; but the theory of universal scepticism does not affirm and deny the same thing; therefore it is not self-contradictory." The *defender* repeats the objection word for word, and then adds: "The major, 'That is not self-contradictory which does not affirm and deny the same thing,' I grant. The minor, 'The theory of universal scepticism does not affirm and deny the same thing,' I deny." *Objector:* "I prove the minor: that does not affirm and deny the same thing which affirms nothing whatever; but the theory of universal scepticism affirms nothing whatever; therefore it does not affirm and deny the same thing." The *defender* repeats the syllogism, and adds: "The major, 'That does not affirm and deny the same thing which affirms nothing whatever,' I grant. The minor, 'The theory of universal scepticism affirms nothing whatever,' I deny." *Objector:* "I prove my new minor: the theory which doubts of everything affirms nothing whatever; but the theory of universal scepticism doubts of everything; therefore it affirms nothing whatever." *Defender*, after repeating the syllogism, adds: "The major, 'The theory which doubts of everything affirms nothing whatever,' let that pass. The minor, 'The theory of universal scepticism doubts of everything,' I deny." *Objector:* "I prove the last minor: universal scepticism is defined as the theory which doubts of everything; therefore universal scepticism doubts of everything." *Defender* repeats the enthymeme, and adds: "The antecedent, 'Universal scepticism is defined as the theory which doubts of everything,' I distinguish: as the theory which pretends to doubt of everything, I grant; as the theory which really doubts of everything, I deny; and therefore I deny the consequent."

Objector: "But the sceptic really doubts of everything; therefore the distinction is of no avail." *Defender* repeats, and adds: "The antecedent, 'The sceptic really doubts of everything,' I deny." *Objector:* "May I ask your reason for denying it?" *Defender:* "I deny it because no man can really doubt of everything; even his own existence; the fact that he is reasoning, speaking, etc." *Objector:* "But the sceptic sincerely affirms that he doubts of everything." *Defender:* "Then he affirms something, and thereby contradicts himself."

The Second Objector: "That should not be maintained as a thesis which cannot be validly proved; but it cannot be validly proved that universal scepticism is an absurd theory; therefore it should not be maintained as a thesis." The *defender* repeats, then adds: "The major, 'That should not be maintained as a thesis which cannot be validly proved,' I will let that pass for the present. The minor, 'It cannot be validly proved that universal scepticism is an absurd theory,' I deny, and therefore I deny the conclusion." *Objector:* "I prove the minor: that proof is not valid which takes for granted what cannot be proved; but the proof of this thesis does so; therefore it is not valid." *Defender* repeats, and adds: "'That proof is not valid which takes for granted what cannot be proved,' I distinguish that major: if that which is taken for granted needs proof, I grant; if it needs no proof, I deny. As to the minor: 'But the proof of this thesis takes for granted what cannot be proved,' I distinguish this the same way: it takes for granted what is evident, and therefore needs no proof, I grant; it takes for granted that which needs proof, I deny. And therefore I deny the conclusion, etc., etc."

BOOK II.

CRITICAL LOGIC.

70. We have studied, in *Dialectics*, the laws which govern the *form* of reasoning; in **Critical Logic** we are to examine the certainty of the propositions, *i. e.*, of the *matter* of reasoning, and the validity of the reasoning process itself. For this purpose we are to consider: 1. *The nature of certainty;* 2. *The existence of certainty;* 3. *The means of attaining certainty, and* 4. *The ultimate test or criterion of certainty.*

CHAPTER I.

THE NATURE OF CERTAINTY.

71. **Certainty** is defined as that state of mind in which we firmly adhere to a truth, on account of motives that exclude all fear of error. To study its nature, we must examine: (*a*) *The nature of truth and of its opposite, falsity;* (*b*) *The various states of our minds with regard to truth, and* (*c*) *The elements that make up certainty.*

Article I. Truth and Falsity.

72. **Truth** denotes *conformity between a mind and an object.* This conformity may be differently viewed:

1. When we consider the knowledge of the mind as conformable to the object known, we have **logical truth**; thus we speak of 'true judgments,' 'a true understanding of a fact or of a theory,' etc.
2. When we consider an object as cognoscible, *i. e.*, as conformable to real or possible knowledge, we have **metaphysical truth.** In this sense the truth of an object is really identical with the very being of the object, for an object is cognoscible inasmuch as it has being; therefore all things have metaphysical truth.
3. When we consider language as conformable to the knowledge of him who uses it, we have **moral truth**; thus we say: 'a true account,' 'a true statement,' etc.

Logic treats of logical truth.

73. **Falsity** is the opposite of *truth.* The mere absence of truth is sometimes called *negative falsity;* but this is not falsity in the proper sense of the word. We never speak of metaphysical falsity, for all things have metaphysical truth: even a false coin is truly what it is, and cognoscible as such; when we call it 'false,' we use a figure of speech by which we mean 'calculated to deceive.' **Logical** falsity exists when there is something in the intellect which is not conformable to the object; **moral** falsity, or falsehood, exists when there is something in the expression not conformable to what is in the mind.

74. **Logical falsity may occur in a judgment in three ways:**

1. The intellect may affirm something which is not in the object; as when it affirms that matter can think, or it counts six stars where there are but five.

2. It may affirm as real what is only apparent; *e. g.*, that the sun moves around the earth.
3. It may deny what really is, *e. g.*, the motion of the earth.

75. The terms 'true' and 'false' are chiefly applied to **judgments** and propositions. Still, a mere **apprehension** or idea may also be called true; for it contains conformity between the mind and an object. But a mere apprehension is never called 'a truth'; this expression is confined to a judgment or a proposition.

76. **Thesis I.** *A mere apprehension, as such, cannot be false.* *Proof.* A mere apprehension, as such, is merely a mental image of something real or possible (for we cannot have an image of something absolutely impossible, *e. g.*, of a square circle, nor of a mere nothing); but every image, as such, *i. e.*, in as far as it is an image, is necessarily conformable to that of which it is the image; else it would not be the image of it. Therefore, inasmuch as it is an image at all, it is true, not false. A portrait may not resemble the person who sat for it, but it represents what it represents, and so far it is a true image.

77. If it be **objected** that we may have a wrong idea or notion of a thing, *e. g.*, of a spirit, conceiving it as a being composed of thin air, we *answer* that our concept of a being composed of thin air is a true idea; for such a being is possible; but, if we go on to judge that such a being is what is called a spirit, we do more than conceive an idea—we join two ideas, we pronounce a judgment. It is not then the mere apprehension but the judgment which is false.

But can we not have an idea to which no possible being corresponds, *e. g.*, of a 'square circle'? We have ideas of 'square' and of 'circle'; but we cannot either imagine or conceive a square circle. If we proceed to form a judgment that these ideas are compatible with each other, the error is

in our judgment, not in our apprehensions. We do not deny that many men have wrong ideas, *e. g.*, of religion, of the Catholic Church, of indulgences, of literary excellence, of honor, etc.; but the falsity in those ideas is due to the false judgments which those ideas implicitly contain, not to the ideas as ideas. For instance, a man conceives of an indulgence as 'leave to commit sin,' and he judges that this is the meaning of the word in Catholic doctrine.

Article II. States of the Mind with Regard to Truth.

78. 1. **Ignorance** is the state of a mind to which the truth is not presented at all; thus, we are all ignorant whether the number of the stars is odd or even. Ignorance is *vincible* if it is in our power to remove it; else it is *invincible*.

2. **Doubt** is the state of a mind hesitating whether to assent to a truth or not. A *positive* doubt sees reasons for and against assent; a *negative* doubt sees no reasons for either side; it comes to the same as ignorance. A mere doubt inclines the mind to neither side; but doubt may be accompanied by suspicion or opinion.

3. **Suspicion** is the state of a mind which has more leaning to one judgment than to its contradictory, but still pronounces no judgment.

4. **Opinion** is the state of a mind pronouncing a judgment, but not without fear of error. The motives for assenting are called the *probability* of a judgment. **Probability** is said to be *intrinsic* when the motives for assent are drawn from the consideration of the matter; *extrinsic*, when they are drawn from the statements of other persons.

5. **Certainty** is the state of a mind assenting to a truth without fear of error. If this fear of error is excluded by motives which leave no room for reasonable doubt, we have certainty in the *proper* sense of the word; if the fear of error is excluded without such motives, we have certainty *improperly* so called. In the latter case, the fear of error is excluded by the free action of the will, which turns away the intellect from considering all reasons of doubt.

79. It is useful to distinguish **speculative** from **practical** judgments: the former regard the certainty of knowledge, *e.g.*, "The bread before me is not poisoned"; the latter, the prudence of action, *e. g.*, "I may eat that bread without further examination." We act prudently when we look for the best guidance of reason that circumstances allow; strict certainty cannot be had concerning every step of daily conduct.

80. Since prudence is not inconsistent with a possibility of error, there may be **invincible error** connected with prudent practical judgments; but all error is inconsistent with strict certainty, and there can be no invincible error connected with judgments which are strictly certain.

81. Error in judgments of any kind, speculative or practical, is always **traceable to free will.** It cannot, of course, be caused by the objective truth; nor can the intellect be necessitated to judge falsely, since its very essence consists in the power of knowing, *i. e.*, grasping, truth. There remains only one possible cause of error, viz., man's freedom to embrace a proposition. The free will of man can often bend the intellect so to fix its attention on the probabilities of a proposition as to overlook all reasons to doubt, and thus form a false judgment, firmly adhering to it without fear of error: this is not certainty, however, in the proper sense of the word (No. 78. 5).

82. **Error** or falsity cannot strictly be predicated of *ignorance*, *doubt*, or *suspicion*; for these states of the mind neither affirm nor deny anything whatever. Ignorance may be culpable, doubt may be unreasonable, suspicion unfounded and rash; but none of these is properly called false. Error can be predicated of nothing but *opinion* and *certainty* improperly so styled, *i. e.*, of that state of mind which excludes the fear of error by the force of the will.

83. While the will is the ultimate source of all error, there are various **proximate sources**; the chief are:

1. *Prejudices*, *i. e.*, judgments formerly assented to without proper examination.
2. Imperfect *teaching* or false information regarding facts and principles.
3. *Confusion of ideas*, whether resulting from dulness, *i. e.*, slowness to distinguish between things similar, or from present inattention, owing to fatigue, negligence, multiplicity of cares, etc.
4. *Passion*, *i. e.*, violent desire or aversion, which prompts our will to accept as true what is pleasing to us.
5. *Impatience* to arrive at a conclusion, either because we are eager to act, or too conceited to doubt our judgment, or too vain to acknowledge our ignorance. From all this it is evident that virtue is favorable to the acquisition of sound knowledge.
6. Another frequent source of erroneous judgments in many persons is a diseased condition of the nervous system or a portion of it. This abnormal state of the body may give rise to a variety of phantasms so vividly presented to the mind as to prevent calm consideration of the reasons for or against the formation of a judgment.

ARTICLE III. THE ELEMENTS THAT MAKE UP CERTAINTY.

84. We have defined *certainty proper* as the state of mind in which we firmly adhere to truth, on account of motives which exclude all fear of error. Several elements are here combined: 1. **Subjectively**, *i. e.*, considering the acts of the mind, we have a firm adhesion (a positive element), and the exclusion of all fear of error (a negative element). 2. **Objectively**, *i. e.*, considering the object known, we have such a manifestation of a truth as is sufficient to exclude all fear of error. The subjective adhesion is caused by the objective manifestation of truth. It is called *subjective certainty*, the manifestation of the truth being designated as *objective certainty*.

85. When the mind reflects on the fact that it has this firm adhesion, its certainty is called **reflex**; when it does not reflect on this fact, its certainty is **direct**. **Philosophical certainty** does not differ from ordinary reflex certainty except in this, that it notices distinctly and scientifically the motives of adhesion to a truth.

86. If we examine objective certainty still further, we find that the truth manifested may be of *three species*, which give respectively three different names to certainty; viz.:

1. Certainty is called **metaphysical** when the mind sees that a proposition is essentially true because its contradictory would be absurd; in such a case an exception is absolutely impossible; *e. g.*, "Virtue is praiseworthy," "A triangle has three sides."
2. Certainty is **physical** when a fact is seen to be so necessary, according to the laws of material nature, that no one but the Author of those laws can make an exception; *e. g.*, "The dead do not return to life."
3. Certainty is **moral** when the mind sees that something

is constantly and universally true in the conduct of men, although dependent on their free choice; *e. g.*, "Serious men do not tell a falsehood on important points without weighty motives."

87. The term 'moral certainty' is often used in a **looser sense** to denote a strong probability; *e. g.*, I have a moral certainty that this house is not on fire just now, though I have no real certainty on the subject.

88. Subjectively considered, all kinds of certainty are alike in the **negative element**, *i. e.*, all exclude fear of error; but the **positive element**, *i. e.*, the intensity of the mind's adhesion to the truth, may be more or less firm: in some cases, as in axioms, and generally in all that is immediately evident, the mind cannot doubt the agreement of subject and predicate. Thus, we cannot help seeing that a whole is greater than its parts, that some bodies exist, that virtue and vice differ from each other, etc. Even in many things that are only mediately evident we cannot entertain a doubt; *e. g.*, no well-informed man can doubt that ancient Rome existed. In many matters, however, we can refuse to admit the objective truth; and in others we even find it difficult to steady our attention sufficiently on the object to exclude all doubt. Metaphysical certainty admitting no possible exception is, as such, nobler than the other kinds; still, it is not always stronger in a given case; thus, I am more intensely convinced of Cæsar's death, which is a matter of moral certainty, than of many theses in Mathematics or Philosophy, which rest on metaphysical principles.

CHAPTER II.

THE EXISTENCE OF CERTAINTY.

89. Scholastic Philosophy begins, as the Physical Sciences pretend to do, by ascertaining and examining **undeniable facts;** in this particular it differs strikingly from many false systems in Philosophy which commence with theories directly contradictory to all experience. When entering on the subject of the existence of certainty, we are at once brought face to face with a patent fact which may be stated thus: *All men having the full use of reason exhibit a direct and natural adhesion to many truths as objectively certain.*

90. We are not yet maintaining that those truths *are* objectively certain; we are only stating the undeniable fact that all men adhere to them as objectively certain. We call this adhesion *direct, i. e.*, antecedent to reflection and to philosophic analysis. For instance, all men consider their own existence, the existence of bodies, the connection between cause and effect, the difference between right and wrong as objectively certain. (See Balmes's *Fundamental Philosophy*, cc. 1, 2, 3; Kleutgen's *Philosophie*, 3d Treatise.) No fact on which any physical science relies is more undeniable. We have called this adhesion *natural*, because in science we call any effect natural if it is found constantly and universally to attend a given cause. Now, this adhesion is constantly and universally found in man; therefore it must be natural to man.

91. **Thesis II.** *This direct and natural adhesion of all men*

to many truths as objectively certain is (*a*) *certainty properly so called;* (*b*) *not indeed philosophical certainty, but* (*c*) *capable of becoming such.*

Proof: (*a*) Certainty properly so called is a firm adhesion to a truth, on account of motives which exclude all fear of error. But the adhesion here spoken of is such; therefore it is certainty properly so called. *We prove the minor:*

1. *It is firm;* in fact, man cannot rid himself of it.*
2. *It excludes fear of error; i. e.,* we do not mistrust these judgments.
3. This fear of error is excluded by the evidence of the *objective truth.* As St. Thomas expresses it: "It is the property of first principles that they not only are necessarily true, but also manifest themselves evidently as objectively true." If this fear of error were not excluded by the evidence of the objective truth, it would be excluded either by the free will of man or by a blind necessity compelling man to judge wrongly. But it is not excluded by our will, for we adhere to the truth even against our will. Nor by a blind necessity to judge falsely; for then our intellect would be no intellect at all, since an intellect is a power to see the truth, not a power to act blindly.

(*b*) *This direct adhesion is not itself philosophic certainty;* for it is antecedent to reflection and analysis, while philosophic certainty is subsequent to both.

(*c*) *It is capable of becoming philosophic certainty;* for, when reflected on and analyzed, it is distinctly seen to contain motives sufficient to exclude all fear of error, and thus the

* The sceptic Pyrrho, when laughed at for fleeing from a falling stone with as much earnestness as if he had no doubt of its reality, replied ingenuously: "It is hard entirely to throw off human nature." If any votary of philosophy should begin to have any real doubts of the existence of certainty, he would need rest of mind and healthy exercise of body, not abstract reasoning, to convince him of objective certainty.

element is supplied which constitutes the accidental difference between ordinary certainty and philosophic certainty, viz., the distinct perception of the motives for adhesion to truth (No. 85).

92. **Objections:** 1. This reasoning supposes several things that have not yet been demonstrated; *e. g.*, that we have understanding. *Answer.* It does not suppose anything that needs demonstration or that could reasonably be doubted.

2. Some judgments in which all men concurred were false; *e. g.*, that the sun moved round the earth. *Answer.* All men *judged* that the sun moved around the earth, we distinguish; they judged about the scientific question whether it was the earth's or the sun's motion that caused the phenomena perceived, we deny; few men gave this question any thought, and those who did would naturally judge that the motion *appeared* to be in the sun. If any judged that it *was* in the sun, they erred freely. All judged that the sun was seen in different directions successively, we grant. They called that change 'motion,' and so do even the learned to-day, when they speak of the sun as rising and setting, and they distinguish apparent from real motion, relative from absolute motion.

93. The only escape from the thesis just proved is that attempted by the **Sceptics**, *i. e.*, by those few philosophers who pretend that man can really be certain of nothing. Sceptics are of two kinds: *universal* or *subjective* Sceptics, who refuse to admit any certainty at all, even that of their own existence; and *partial* or *objective* Sceptics, who admit their own existence and nothing or very little more.

94. **Thesis III.** *The theory of Universal Scepticism is self-contradictory. Proof.* That theory is self-contradictory,

UNIVERSITY OF CALIFORNIA

which affirms and denies the same thing; but such is the theory of universal Scepticism. Therefore it is self-contradictory. *We prove the minor:* Scepticism denies that there is any certainty at all; at the same time it implicitly affirms several things as certain; *e. g.*, that certainty is something different from doubt, that the words used have certain meanings, that those using them exist, etc. If the Sceptic should plead that he does not hold even those points as certain, he must then grant that, for all he knows, he may be saying and even meaning just the contrary of what he teaches, which would be an absurd theory; but even this would implicitly affirm that the Sceptic exists, speaks, etc.

95. In connection with Scepticism, we must consider the **Methodic Doubt** recommended by Descartes, who, under the Latinized name of Cartesius, wrote in the middle of the seventeenth century. He was not a Sceptic; but he traced out a false system of studying the existence of certainty: destroying the solid basis of Philosophy, he substituted for it a weak fabric of his own invention, and left little in the minds of his followers but ruin and confusion. He maintained, (*a*) That every philosopher should begin his speculations by doubting of everything. (*b*) Next, the philosopher will find that he cannot help granting the fact of his own thought, and he will conclude from it his own existence: *Cogito, ergo sum*—"I think, therefore I am." (*c*) Hence the would-be philosopher will infer the general rule that whatever is clearly perceived is true. (*d*) Then finding that he clearly perceives the idea of God, he thence concludes to the existence of God. (*e*) From the veracity of God he infers the reliability of his own faculties. (*f*) Thence, at last, he reasons to the certainty of his knowledge.

96. **Thesis IV.** *Descartes' Methodic Doubt is absurd. Proof.* That is absurd which affirms and denies the same thing; but

the doubt in question does so. For in it the philosopher begins by denying the reliability of reason, and at once implicitly affirms its reliability by using it to prove his own existence: "I think, therefore I am." He pretends to doubt all his faculties, and still he treats the guidance of those same faculties as reliable. Besides, Descartes moves in a vicious circle: he proves the reliability of our faculties by the veracity of God, and the veracity of God by the reliability of our faculties, etc.

97. The error of Sceptics arises from their **false supposition** that nothing is certain which is not demonstrated by discursive reasoning. Now, the science of Mathematics begins by the admission of axioms which are self-evident; *e. g.*, that "the whole is greater than a part," that "two things equal to a third are equal to each other," etc. The science of Philosophy must follow a similar process: it must draw its first conclusions from premises which are evident without proof. Besides, like Mathematics and all other sciences, it must admit without proof the reliability of the reasoning process. If the first premises and the reliability of reason required proof, man could never make the first start in scientific studies; in fact, he would be incapable of reasoning at all: he would not be a rational being.

98. Every philosopher, therefore, must, on entering the field of science, affirm with certainty: 1. His own existence; called *the first fact.* 2. The principle of contradiction, viz., that a thing cannot 'be and not be' at the same time; called *the first principle.* 3. The power of the intellect to know truth; called *the first condition.* These truths are not blindly admitted: they are seen to be objectively evident. There is no alternative between admitting them and admitting the self-contradiction of universal Scepticism.

99. To refute **partial Scepticism**, we must prove the reli-

ability of the various means by which certainty may be attained, as we shall do in the following chapter. Still, the arguments which we shall adduce will, in many cases, be rather *scientific explanations than strict proofs : scientific explanations*, because they will show distinctly what causes or reasons we have for firm adhesion to the truths; *not strict proofs*, because the reliability of the means in question is in several cases proved while taking their reliability for granted, as having no need of demonstration.

CHAPTER III.

MEANS OF ATTAINING CERTAINTY.

100. The **means at our disposal to attain certainty** are, *directly*, our own cognoscive powers or faculties, viz., intellect and sensation, and, *indirectly*, the authority of other men. To explain these clearly we must treat: 1. Of *our cognoscive powers in general;* 2. Of *Intellect* in particular; 3. Of *sensation;* 4. Of *authority*. To all this we shall add a chapter on *common sense*, which, though proceeding from the intellect, requires for the discussion of its certainty the previous understanding of the reliability of intellect, sensation, and authority.

ARTICLE I. A SKETCH OF OUR COGNOSCIVE POWERS.

101. I. **The outer senses.** Our first step in the acquisition of knowledge is the perception of material objects by means of material instruments which are parts of ourselves, and are called the organs of sense.

102. An **organ** is a part of a living body peculiarly constructed by the Creator for the purpose of exercising a function of life. Living bodies are made up of such organs. In man, and in the higher animals generally, five of these organs are intended for the perception of exterior bodily objects; these are called the organs of the five outer or exterior senses, viz., of the *sight*, *hearing*, *smell*, *taste*, and *touch*.*

* Physiologists now split up the touch into two senses, the tactual or skin sense and the muscular sense; the former perceives heat and cold, roughness and smoothness, etc.; the latter perceives resistance, exteriority, and extension. President McCosh

103. II. **The inner sense.** There is, besides, an internal or inner sense, whose organ is some portion at least of the nervous system; it perceives interior modifications of the animal body, such as cause the feelings of hunger, thirst, fatigue, pain, comfort, etc. It also perceives the actions and affections of the various external senses; for an animal not only sees, hears, tastes, etc., but it also *feels* that it sees, hears, tastes, etc. This inner sense, in as far as it takes cognizance of what is done by the outer senses, is often called *the common sense*, and its organ is styled the common sensory; but the term *common sense*, without the definite article 'the,' stands for a very different idea, viz., for the common judgment of men on matters of universal importance to mankind.

104. The inner sense does not perceive the causes of the affections which it perceives, but only the fact that those affections exist. As both the objects of sensation and its organs are material, **the action of all sensation is material,** organic, and is common to man and brute. But the organ is, of course, not dead but living matter; it is one substance with the soul, *i. e.*, with the principle of life; hence the actions of any sense are actions of the living compound soul and body.

105. III. **The imagination.** When an animal perceives

describes it thus, quoting Wundt's *Beiträge zur Theorie der Sinneswahrnehmung:* "When we move our members we come upon external resistances. We observe that these resistances sometimes give way before our pressure; but we find at the same time that this takes place with very different degrees of facility, and that, in order to put different bodies in motion, we must apply very different degrees of muscular force; but to every single degree of the contraction-force there corresponds a determined degree in intensity of the muscular sensations. With these muscular sensations, the sensations of the skin which cover our members of touch so continually mingle, that the intensity of these touch-sensations goes parallel to the intensity of the accompanying muscular sensations. We succeed in this way in connecting the degree of intensity of the muscular sensations in a necessary manner with the nature of the resistances which set themselves against our movement" (*Defence of Fundamental Truth*, p. 173).

material objects, it forms and retains of them material images or representations, called *phantasms*. The organ used for these purposes is the brain. The imagination is the power of forming and retaining those images, of recalling them on occasions, and of combining them in wonderful varieties, thus forming new phantasms which in turn may be recorded and retained, etc. We should not suppose those images to be pictures, for we can have no picture of taste, smell, etc.; they are modifications of some kind.

106. IV. **The sensile memory.** This name denotes that portion of the imaginative power which retains and recalls the phantasms, but it adds a further function, viz., that of recognizing, not intellectually however, present sense-perceptions and present phantasms as identical with former phantasms and former sense-perceptions. By this faculty "The ox knoweth his owner, and the ass his master's crib," as Holy Writ expresses it. The inner sense, the common sense, the imagination, and the sensile memory need not be considered as distinct faculties, but rather as various functions of the same faculty, which may be generally designated as *the inner sense.*

107. V. The **intellect,** understanding, or mind, in the proper meaning of this term, is an entirely different faculty; it does not confine its perceptions to the material qualities of objects, as all sense-action does, but it penetrates into the very essences of things material and immaterial (*intus legit*, it reads within), and it forms concepts or ideas representing essences, *e. g.*, of 'plant,' 'tree,' 'spirit,' etc. Even when it considers mere accidents, *e. g.*, 'color,' 'shape,' 'size,' it need not simply consider this individual color, shape, or size, as material faculties must do, but it can consider the essence of color, shape, and size; so that, by a power peculiar to itself, it forms ideas representing qualities as abstract—*i. e.*, drawn

forth, as it were, from the subjects in which they are found and thus stripped of their individuality.

108. VI. **The judgment.** Besides conceiving ideas, the intellect judges; *i. e.*, it compares two ideas together and pronounces on their agreement or disagreement. This act of the intellect is called *judgment;* it was explained in *Dialectics* (No. 17).

109. VII. **Reason** is not a faculty distinct from the intellect and the judgment; it is the intellectual act or process of deriving judgments from other judgments; it, too, was sufficiently explained above (No. 22).

110. VIII. **The intellectual memory** is another function of the intellect; it enables us to perceive and reproduce ideas, judgments, and reasonings formerly elicited, and to recognize identity or difference between present and former objects of knowledge. The intellectual memory is greatly assisted in its action by the sensile memory, which associates phantasms with mental concepts.

111. IX. **Consciousness** is the intellectual power of perceiving our own internal acts, whether of intellect and will or of our interior sense; it will be more fully explained in the following article.

Article II. The Intellect in Particular.

112. **The intellect** or understanding may be called the *universal means* by which certainty is to be acquired; for certainty is a state of the mind or intellect, and therefore it cannot be reached except by the intellect. That the intellect may begin to act, it must be excited by sensation; and therefore those whose senses are very imperfect remain idiotic. But sense, no matter how perfect, can never elicit a judgment. Still, sense is a means by which the human intellect is brought into communication with many objects of knowledge, and

the reliability of sense-perception will be examined in the next article.

113. We are just now concerned with **the certainty of intellectual knowledge as such.** We must begin this study by recalling to mind that *the first condition* for the attaining of all certainty is the capacity of the intellect to reach truth. We need not, then, prove the reliability of our intellect. But we must here examine *what is involved or included in this capacity of the intellect to know truth.*

It involves the certainty, 1. Of *consciousness;* 2. Of our *primary ideas;* 3. Of *immediate analytical judgments;* 4. Of the *intellectual memory;* 5. Of the *reasoning process.* We shall examine the reliability of these functions of the intellect in detail; in doing so, we shall *scientifically explain* rather than *prove* our theses; for the first condition of certainty needs no proof.

§ 1. *Consciousness.*

114. **Consciousness** is the reflex perception of our own acts, *i. e.*, of ourselves as acting. We not only think and feel, but, when we reflect, our mind perceives that we think and feel. This reflection consists, as the word indicates (*reflectere*, to bend back), in the bending back of the mind upon itself, upon its own acts. Reflection is, of course, not the beginning of our knowledge; for we must first think and feel before we can perceive that we think and feel. But when we scrutinize our own knowledge, this reflection on self is the first act to be examined in the process of our study.

115. This reflection should not be confounded with reflection in the sense of *remembrance.* **Nor should consciousness be mistaken for the inner sense,** explained above (No. 103). It differs from it: (*a*) In the *subject* that elicits the act: consciousness is elicited by the simple intellect, sensation by the human compound; (*b*) In the *object* perceived: con-

sciousness perceives both simple and organic actions, the inner sense organic actions only; (*c*) In the *manner* of perception: the perception of sense terminates in phantasms, that of consciousness in ideas and judgments, affirming that the facts exist, *i. e.*, that we really think or feel as we are conscious we do. But consciousness is not the function which perceives what are the causes of our feelings, *e. g.*, the causes of pain or comfort experienced; such causes are made known to us by reasoning and repeated observation united, *i. e.*, by induction.

116. **Thesis V.** *The reliability of consciousness is included in our capacity to know truth.*

Explanation. We are not proving our capacity to know truth; this capacity needs no proof (Nos. 97, 98); but we maintain here that this same capacity of our intellect to know truth could not exist unless our consciousness were reliable.

Proof. That is included in our capacity to know truth, without which we could never know whether we know or not; but without the reliability of consciousness we could never know whether we know or not. Therefore—

We prove the minor. It is only through consciousness that we know our own intellectual acts; therefore, if consciousness were not reliable, we could not really know whether we are eliciting acts of knowledge.

117. It will be noticed that the field of **consciousness covers** the following objects of knowledge: 1. Our own existence; for we perceive ourselves as being the subjects of our intellectual acts and of our sensations. 2. The existence of our intellectual acts. 3. The existence of our internal sense and of its acts.

118. **It may be objected:** 1. We are not conscious of all our internal acts. *We answer:* We claim certainty for those only of which we are conscious.

2. Many persons are conscious of affections which do not exist; *e. g.*, that they are ill when they are not ill. We *answer:* They are conscious of certain feelings, from which they infer by faulty reasoning that they are ill. Consciousness reveals only the existence of the feelings, not their causes.
3. Lunatics are conscious of being kings, princes, etc. *Answer.* They are conscious of judging themselves to be kings, etc., and they do judge so owing to their diseased imagination. For lunacy supposes an inability to distinguish between imaginations and real perceptions; but the consciousness of even a lunatic is reliable.
4. No one can know that his certainty is not owing to a diseased imagination. *Answer.* If so, universal Scepticism would follow, and the intellect would be incapable of knowing truth.
5. The proof takes for granted the reliability of our consciousness, the point to be proved. *Answer.* We are not giving a strict proof, but only a scientific explanation; for the first truths cannot be strictly proved and need no demonstration.

§ 2. *Primary Ideas.*

119. By **primary ideas** we do not mean inborn ideas; for no ideas are inborn in us: we have no ideas antecedently to sense-perception. But whereas by sense we form phantasms or material images of bodies observed, we form by our intellect ideas or immaterial images of what is cognoscible in those bodies; *e. g.*, of 'being,' 'substance,' 'size,' 'color,' etc. The objects of sense are necessarily individual, extrinsic, and concrete qualities; the proper objects of the intellectual idea are universal and abstract notes.

120. **We call primary ideas** those of 'being,' 'truth,' 'substance,' 'cause,' 'effect,' etc.; all those, namely, that are involved in our commonest perceptions. Of these we assert that they have *objective truth*, and that their objective truth is implied in the very capacity of our intellect to understand truth. Kant makes them *subjective forms* only, to which nothing objective corresponds.

121. **Thesis VI.** *Our primary ideas are objectively true, i.e., conformable to objects really existing.*

Proof. If these ideas were not objectively true, not conformable to objects really existing, our commonest knowledge would be but an illusion; if, for instance, 'being,' 'truth,' 'substance,' etc., were mere figments of the imagination or of the intellect, we could never know anything. Therefore they are objectively true.

122. It must be carefully noticed, however, that the *object of a universal idea* does not really exist as a universal object: everything that really exists is an individual thing. Likewise, the object of an abstract idea does not really exist as an abstract object: every existing being is concrete. For instance, there exists no real abstract or universal cause, nor any real abstract and universal effect, substance, being, etc., just as there exists no real abstract or universal animal, which would be neither rational nor irrational, but simply have the qualities that make up the genus animal. How, then, is the idea 'animal' objectively true? Because the qualities expressed by the term 'animal' really exist in every individual animal. Nothing, then, in nature *exists* in the abstract; but anything may be viewed in the abstract by the intellect, and abstract notes are the distinctive objects of intellectual cognition.

123. Now, the abstract idea is the same as the universal idea: the word '**abstract**' denotes the manner in which such an idea is formed, while the word **universal** denotes its

applicability to many objects. Thus, I form the abstract idea 'animal' by attending to the notes, which I perceive in any individual animal, viz., 'a material substance endowed with life and feeling'; these notes I draw forth, or abstract (*abstraho*), for separate consideration, or, if you wish, I withdraw my attention from the other qualities of that same individual animal which I am considering. Since these same notes conceived are common to all animals, my concept of 'animal' is a universal concept, *i. e.*, it is predicable of a whole class. In as far as my idea 'animal' denotes only the qualities or notes that make up its *comprehension*, it is called a **direct universal**; but when I reflect besides that the idea is applicable to many beings, *i. e.*, when I consider also its *extension*, the idea is then called a **reflex universal.**

124. Philosophers have warmly disputed upon the nature of these reflex universals: the **Nominalists** call them *mere names*, which are given to a confused collection of individuals, but to which no concepts correspond; the **Conceptualists** call them *concepts*, but they suppose those concepts to be mere figments of the intellect to which no real objects correspond; the **Exaggerated Realists** supposed that *universal beings* really exist corresponding to the universal concepts; the **Moderate Realists** maintain that *some reality* in objects corresponds to the abstract idea, yet that such reality does not exist objectively as an abstract or universal being without individualizing notes, but it exists concretely in each individual object. The explanation we have given in the two preceding numbers is that of the moderate realists; but the scientific proofs of our doctrine and the refutation of other systems belong to Psychology.

§ 3. *Immediate Analytical Judgments.*

125. **Analytical judgments,** as explained above (No. 17), are those judgments in which the agreement or disagreement

of the subject and predicate is perceived by the mere analysis of their meaning, without the aid of experience. If this agreement or disagreement is perceived at once, without reasoning, the judgments are said to be **immediate.**

126. **Thesis VII.** *Immediate analytical judgments can never be false.*

Proof 1. That such judgments cannot be false is made evident by considering their very nature; for they consist in affirming or denying explicitly what the very idea of the subject contained or excluded implicitly; *e. g.*, when I conceive 'a part,' I conceive something as distinct from 'the whole,' and distinct from it by being less. Thus all immediate analytical judgments, *e. g.*, 'The part is less than the whole,' do no more than affirm or deny explicitly what the subject of them contained or excluded implicitly before the judgment was formed.

Proof 2. Our intellect has the power to know truth (No. 98). Therefore that can give us real certainty which is implied in the capacity of our intellect to know truth, or which must be objectively true if the intellect can know truth at all. But such are these judgments. For if our intellect could not be relied on in these judgments, *e. g.*, that 'a circle is round,' that 'a part is less than the whole,' etc., then the intellect could never be relied on in any judgments; for none are more evident. Therefore it can be relied on in these: they give us real certainty.

127. **Objections:** 1. This thesis cannot be demonstrated. *Answer.* It need not be; for it is evident.

2. Some of the judgments are false, *e. g.*, "The whole is greater than the part"; for the whole Blessed Trinity is not greater than any of the Persons. *Answer.* The Divine Persons are not parts of God; each of them is the infinite God whole and entire.

3. Another of these judgments is false, viz., "Out of nothing nothing can be made"; for the world was made out of nothing. *Answer.* This analytical judgment means that nothingness cannot be a material out of which a thing can be made, while, in creating, God made the world without using any material; He did not make nothingness the material of His creation.
4. All our judgments are empirical; for they presuppose sensation. *Answer.* They presuppose sensation before we can conceive the ideas, we grant; they compare the ideas by attending to experience and sensation, we deny. Now, the latter is required for empiric judgments. (No. 17.)
5. No judgments are certain; for to err is natural to man. *Answer.* To err sometimes in his opinions, yes; to err in his certain judgments, no.
6. Analytical judgments are useless; for their predicates are contained in their subjects, even though no judgments be elicited. *Answer.* They formally and explicitly discover and express what predicates are implicitly contained in their subjects.

§ 4. *Memory.*

128. **Memory** is the power of retaining and re-awaking former knowledge, and of recognizing it as former knowledge. It is twofold:

1. **The sensile memory** retains and re-awakes phantasms—*e. g.*, of a whip formerly seen or heard and of a pain felt—and it perceives a connection or association between those phantasms. In this way brutes remember as well as men. (No. 106.)
2. **The intellectual memory** retains and re-awakes ideas —*e. g.*, of what we formerly saw, felt, read, thought, or

willed—and it judges that the objects of those ideas were formerly perceived. In man the sensile and the intellectual memory work together and assist each other.

129. The memory acts **voluntarily** when it recalls the past at will; **spontaneously,** when the will has no share in the act. To act spontaneously, the memory must be aroused by a perception in some way associated with a former perception; *e. g.*, the fragrance of a fruit may recall its taste; the idea of eternity may recall the shortness of this present life.

130. **Thesis VIII.** *The reliability of our memory is contained in our power to know truth.*

Explanation. We do not maintain that we can recall all our former perceptions; but simply that, when our memory does recall a former perception, and judges with certainty that the object now recalled is identical with an object perceived before, it is reliable in such a judgment, and that this reliability of the memory is contained in the power of our intellect to know truth.

Proof. That is included in the intellect's power to know truth, without which all connected thought and all expression of thought would be impossible. But the reliability of our memory is such. For, unless our memory were reliable, we could not think connectedly, since one judgment would be forgotten before another could be compared with it; and no thought could be expressed, because no words could be remembered to express them.

131. If it be **objected** that our memory often deceives us, we *answer:* Not when it gives us, on careful consideration, positive testimony, excluding all fear of error. But men are often too careless, impatient, or presumptuous to examine their recollections properly.

§ 5. *Reasoning.*

132. When we attempt to reason in order to prove the

reliability of reasoning, we evidently do not pretend to give a strict proof; we simply give a **scientific explanation**, showing why it is that a conclusion logically derived from true premises must be as certain as the premises themselves.

133. **Thesis IX.** *Whoever grants the premises of logical reasoning cannot deny the conclusion.*

Proof. All logical reasoning, as explained above (Nos. 22, etc.), is based on this principle, that the conclusion is implicitly contained in the premises. Hence, he who would grant the premises and deny the conclusion would thereby affirm and deny the same thing; but one cannot deny what he affirms. Therefore whoever grants the premises of logical reasoning cannot deny the conclusion.

134. **Objections**: 1. If the conclusion were contained in the premises, nothing new would be learned by reasoning. *Answer.* The knowledge of the conclusion is new to us; for, although the conclusion was implicitly contained in the premises, we did not know this conclusion in particular till we arrived at it by reasoning. Thus, all the theorems of Geometry are derived from the preceding theorems and ultimately from the axioms.

2. Reasoning leads men into many errors. *Answer.* Not when it is materially and formally correct.

3. The proof given holds only for the syllogism. *Answer.* All reasoning is reducible to the syllogistic. (See Nos. 35, etc.; in particular, for induction, No. 46.)

Article III. Sensation.

135. The faculty of **sensation** distinguishes all animals from all vegetable substances; for 'sentient' is the *difference* which, added to the *genus* 'living material substance,' con-

stitutes the *species* 'animal.' By saying man is an 'animal' we mean exactly this, that he is a living material substance endowed with sense.

136. Now, sense is a cognitive power, *i. e.*, a power of knowing; its action, or knowledge, is elicited by a living material substance, and its organs consist of the living material nerves. It is a clear and certain principle that no action can be superior to the agent, else the effect would exceed the cause; therefore, as sense is a material power, **it can know nothing higher than material objects.**

137. Besides, any matter is a concrete individual portion of matter; both the organs and the objects of sense are such, and therefore every sense-action will be a concrete individual modification of a concrete individual portion of matter. But it is evident that a concrete individual modification of a concrete individual portion of matter can picture or represent by its own nature nothing but a concrete and individual modification of matter; now, perception of sense consists in such representation, hence **sense can perceive nothing but concrete and individual modifications of matter.**

138. When sense perceives the material modifications that take place within its own animal body, it is called **inner sense**; when it perceives the material modifications that take place outside of its animal body, it is called **outer sense.** Inner sense was more fully explained above (Nos. 103, 104).

§ 1. *The Inner Sense.*

139. The **inner sense** does not testify to the causes of our feelings or affections; for by our inner sense we merely feel a certain affection called pain or comfort; by our animal instinct we are prompted to seek relief of the pain or increase of the comfort; but it is only by a process of inductive reasoning that we have learned intellectually to refer this

certain feeling to a special cause. Thus we have learned by long experience that a peculiar feeling of discomfort arises from want of food, another from want of drink, etc.

140. **Thesis X.** *Inner sense is reliable in its perceptions;* i. e., *the material modifications perceived by it really exist.*

Proof. To say that the inner sense is not reliable in its perceptions, is the same as to say that those identical affections, or inner modifications of the animal body, which are perceived, do not really exist. But this cannot be said without absurdity; for 'to be perceived' means 'to be that which is perceived' or 'to exist as the object of perception.' If, then, those affections did not really exist, they would 'exist and not exist'; which is absurd.

141. **Objections:** 1. The inner sense sometimes testifies to the feeling of a pain in an amputated limb. *Answer.* It testifies to the feeling of a pain, we grant, and there really is a pain; but it does not testify to the exact cause of that pain. The feeling experienced now may be similar to that experienced before the limb was amputated. Then the feeling of pain arose from some lesion in that limb; and now, the imagination reproducing this former relation, affords us an occasion for judging that the present sensation is again owing to the limb which is no longer there. We feel a lesion, which we may be inclined, by the force of habit, to locate in the amputated limb, whereas the nerves are affected elsewhere, namely at their extremity, which is exposed and very sensitive.

2. The inner sense fails to report all affections. *Answer.* We simply maintain that those affections exist which it does report.

3. The proof supposes that the inner affections are really felt and therefore must really exist; but perhaps we

only imagine that we feel them. *Answer.* We know by consciousness that we can imagine a certain pain, for instance the pain of burning, and that we can feel that pain, but that there is a vast difference between these two acts.*

§ 2. *The Outer Senses.*

142. We stated before (No. 102) that we perceive objects outside of us by the five outer senses of sight, hearing, smell, taste, and touch. **Two very different questions** present themselves on this subject: 1. How far is the testimony of our external senses reliable? 2. How do the senses work so as to give us reliable testimony? The full treatment of the latter question belongs to Psychology, that of the former to our present study of Critical Logic. We are absolutely certain of many facts, though we cannot satisfactorily explain how they are brought about: a man exhausted with hunger and fatigue is absolutely certain of the pleasure and the restoration of strength which he derives from a wholesome meal, although he cannot explain the exact process by which the senses and the digestive power contribute to these results; similarly, all men are certain that the outer senses often give reliable information, though few are able to describe the manner in which this is accomplished.

143. **The obvious facts in the case** are these: (*a*) We have various sensations of outer objects in and by our external senses; (*b*) *We judge the cause of these to exist in bodies, i. e.,*

* The objective reality of both sense-perception and intellectual perception is well expressed in the following words of Very Rev. I. T. Hecker (*Cath. World*, Oct., 1887, p. 6): "To see, if one is not a fool or a lunatic, is to see something. To act on any other view of human life, is to tend to imbecility. This law of objective reality applies to the entire realm of human activity. Life is real. 'Wherefore,' says St. Augustine on the Trinity (book ix), 'it must be clearly held that everything whatsoever that we know begets in us the knowledge of itself, for knowledge is brought forth from both, from the knower and the thing known.'"

in substances distinct from our mind, having extension and peculiar powers of action; (*c*) We adhere to this judgment firmly without fear of error. **We maintain** that our firm adhesion to this judgment is due to the objective existence of bodies, and that therefore our external senses are reliable in their sensations of outward objects.

144. But some philosophers argue that we do not know bodies except by means of phantasms and ideas, which are subjective in us, and which, for all we know, may have no objective reality corresponding to them. These philosophers are called **Idealists.** They are divided into two schools: 1. Fichte, the leader of the **subjective school,** maintains that there exists nothing but his own mind which is ever imagining unrealities: "The *Ego* posits itself." 2. Berkeley, the leader of the **objective school,** makes God the direct cause of our phantasms and ideas.

145. Such speculations, instead of resting on solid facts, as all sciences should do, are in direct conflict with all known facts and with the firmest judgments of all mankind. Every sound mind knows for certain **the difference between real perceptions and mere imaginations**; and unsoundness of mind consists precisely in the inability of some men to distinguish between objective realities and mere phantasms. But there is no likelihood that any philosopher of note ever doubted the existence of bodies. Such as pretended to doubt did violence to their own good sense in order to support some pet theory, by which they earned the name of original thinkers.*

* Hume writes in his *Treatise on Human Nature:* "I dine, I play a game of backgammon, I converse and am happy with my friends; and when, after three or four hours of amusement, I would return to these speculations, they appear so cold, so strained, and so ridiculous that I cannot find it in my heart to enter into them any farther" (vol. i. p. 467). Why did Hume and Fichte write books if they really believed that no readers existed?

146. **Thesis XI.** *By our external senses we really perceive bodies*, i. e., *substances distinct from our mind, extended and resisting.*

Proof. Nothing exists without a reason for it; but there exist in us, as we know by consciousness, (*a*) Sensations; (*b*) Irresistible judgments that those sensations are caused by bodies, *i. e.*, by substances distinct from our mind, extended and resisting; therefore a reason must exist for those sensations and for those irresistible judgments. But that reason can be none other than bodies really existing; therefore they really exist.

We prove the last minor: If that reason were not in the bodies, it would be either, 1. In our minds, as Fichte maintains; or, 2. In God, as Berkeley supposes. No other reason is assigned by our opponents. Now, it is, 1. Not *in our minds.* If it were, we should produce those sensations and judgments necessarily or freely; but we do neither: (*a*) Not freely, for we see, hear, feel, etc., many things which we are totally unwilling to see, hear, feel, etc.; (*b*) Not necessarily; for if we were so constituted that we necessarily elicited false judgments, our intellect would be essentially unreliable; it would be a power, not of knowing truth but of deception and falsification. 2. Not *in God.* Those who admit the existence of God at all, as Berkeley and his followers do, admit that He is the infinitely perfect Being; but a perfect being is essentially truthful and cannot be the source of a universal deception, as He would be if He produced those phantasms and gave us at the same time an irresistible impulse to judge falsely of their cause.

147. **Objections:** 1. An evil genius could produce the deception. *Answer.* We deny this; for the deception, if such it were, would be, not accidental, but natural and essential to man, and therefore it would be essen-

tial to man to judge falsely; and thus universal Scepticism would become reasonable.

2. God would not be omnipotent if he could not directly produce on us all the effects that bodies can. *Answer.* He cannot give us an irresistible propensity to judge falsely; this would be against His own perfect nature, and it would leave us incapable of having certainty, of knowing truth.
3. God does so in visions, *e. g.*, when He made Tobias see an Angel. *Answer.* The Angel had assumed a material body.
4. Sometimes a vision is merely subjective. *Answer.* Then the intellect sees reason to suspect the truth.
5. In dreams we judge irresistibly that we perceive real objects. *Answer.* In dreams we do not examine the certainty of our judgments; we have not that reflex certainty which we are here considering. Besides, in dreams we are not in the normal state of rational beings.
6. Those suffering of *mania a potu* cannot rid themselves, even on reflection, of the perception, as they suppose it to be, of snakes, demons, etc. *Answer.* From the fact that a disordered mind cannot know the truth, it does not follow that a sound mind cannot; besides, they no doubt perceive their own abnormal condition and see reasons, when they reflect at all, to doubt their visions.
7. From any act which is only subjective we cannot infer the existence of the objective reality; but sensation is only subjective. *Answer.* Our sensation is not merely subjective; for it is a perception, and a perception is the subjective act of taking in an object: a perception without an object perceived is a self-contra-

diction: there can be no taking in of nothing. Besides, we invincibly judge that our perceptions are due to objects (Nos. 143, etc.)

148. To understand **how far the reliability of our senses extends**, we have only to examine on what points sensation prompts us irresistibly to elicit judgments. As this is a question of great importance, we shall consider it with some detail.*

1. We may see a painting in the distance and judge it to be a statue; we may judge a sound to come from a greater distance than it does. Do our senses deceive us on those occasions? Not at all: in fact, the sight, as such, does not inform us whether all the parts of the object seen are equally near, as in a painting, or unequally, as in a statue. Neither sight nor hearing, as such, tell about distances: sight deals with color and, consequently, with the outlines of colored objects; hearing deals with sound, of which we perceive countless varieties. Each sense has thus its own **proper object of sense-perception** (*sensibile proprium*). The proper object of sight is *color*; of hearing, *sound*; of smell, *odor*; of taste, *flavor*; of touch, *temperature* and *resistance*. The perception of resistance enables us to distinguish between varieties of surfaces, some of which are noticed to be yielding or soft, others unyielding or hard; some are even or smooth; some uneven or rough; some are bounded by straight, others by curved lines; some extend over a large, others over a small space, etc.
2. As extension, outline or figure, number, etc., are perceptible by touch and sight, they, and in general all

* See *The Old Philosophy and Relativity of Knowledge*, by Henry Brown. (*The Month*, September, 1888.)

those qualities of bodies which are perceptible by more than one sense, are called the **common objects of sense-perception** (*sensibile commune*).

3. Sense does not perceive color, sound, resistance, etc., in the **abstract**; but it perceives something colored, sounding, resisting, etc., in the **concrete.**

4. While by our senses we perceive some concrete body as colored, resisting, etc., **our intellect,** by its power of abstraction, abstracts, or considers apart, various notes or marks of that body, such as 'color,' 'resistance,' 'existence,' 'quality,' 'substance,' etc., and thus forms **abstract ideas**; next, by its power of judging, it compares these ideas and the objects perceived together, and pronounces **judgments,** such as 'this substance is colored,' 'something resisting exists,' etc.

5. **The senses usually assist each other**: the eye beholds what the hand touches; the ear perceives the sound, the eye the figure of the rattle or the string which the fingers move. Thus from earliest infancy we have learned by practice to associate our sense-perceptions with one another and with our intellectual acts; we have perfected our associations of phantasms by inductive reasoning, till we have acquired great readiness to judge of the qualities revealed to one sense by the proper object of another sense. For instance, on hearing a familiar human voice we know the presence and the very expression of countenance of a well-known person; from the fragrance of a fruit we can tell its taste; from the aroma we judge the form of a flower.

6. We see many reasons to judge, and on many points no reason to doubt, that **the senses of brute animals** work in the same way as our own. Brutes perceive

the proper and the common objects of sense; and, as their organs and their instincts are often more perfect than ours, brutes may associate phantasms, derived from various senses, more readily and perfectly than we do, as is well exemplified in the scent of the dog and the cunning ways of the fox.

7. Sense does not perceive substance as such; *i. e.*, as distinct from quality; but still, by perceiving the concrete qualities, it puts us into relation with substance. What is thus intellectually perceived on account of sense, is said to be **indirectly sensible** (*sensibile per accidens*). Brutes do not judge at all, in the proper sense of the word; they merely associate, *e. g.*, the stone thrown with the man who throws it, and they do not always do even that: the dog will often bite the stone itself. The Creator, in His wisdom, has given brutes as perfect a power of associating phantasms as is beneficial to themselves and to man, for whose advantage they are evidently intended.

8. Man both associates and judges; for he has instinct and reason. It is, however, only on occasions of some importance that we stop to consider whether our judgments are well enough founded to exclude all doubt. We find them to be such when, on careful examination, we perceive that they give us evidence of the objective truth. That they may do so with regard to our sense-perceptions, the following **conditions** must be fulfilled: (*a*) We must be conscious that we are in a normal or healthy condition; else we can see reason to suspect the testimony of our senses. (*b*) We must be aware that our surroundings appear normal; *e. g.*, if all around us looked yellow, we should see reason to suspect that our eyes were jaundiced. (*c*)

We must find that our senses are concordant with one another and constant in their testimony; *e. g.*, if a passing glance makes me perceive an unusual appearance, I look again with care, I shift my position to dispel all possible illusion of the sight; or I even apply my hands to touch what excites my surprise.

149. **Thesis XII.** *The external senses, acting under proper conditions, are reliable with regard to their proper and their common objects of sensation.*

The proper conditions here spoken of have just been explained. This thesis defines the extent to which the outer senses are perfectly reliable.

Proof. The senses are reliable in their testimony if they perceive nothing but the objective truth; but such is the case. For, being physical powers, they work necessarily, and therefore they can only perceive the objects presented to them; else they would perceive what does not exist; *i. e.*, that which does not exist would be an object of perception; which is absurd.

150. We do not, then, **claim certainty** for every judgment that is formed on occasion of sense-perception, but only for what the senses really report, *i. e.*, the existence of those sensible qualities which are the proper and the common objects of sensation. The substance itself in which those sensible qualities exist is not apprehended, by the senses, as distinct from those qualities. From the knowledge of the qualities perceived by sense, the intellect judges the nature of the substance in which those qualities inhere. In forming its estimate of that substance, the intellect may often be mistaken; *e. g.*, it may judge that to be an orange which is a lump of wax; it may mistake a picture for a body. But even in such cases the intellect is not led necessarily into error, but it can suspend its judgment till all fear of error has been removed.

151. **Objections**: 1. The senses tell us that sugar is sweet, fire hot, etc., while Descartes and others prove that these qualities are not in the bodies perceived, but in the senses. *Answer.* When we say that sugar is sweet, fire hot, etc., we mean that those bodies have real qualities which produce in us corresponding sensations of sweetness, heat, etc.; both the qualities that are in those bodies and the sensations that are in us are denominated by the same terms analogically. Certainly sugar and fire have real qualities which are causes of our sensations.

2. We know by science that the sun is not exactly there where we see it; here the sight deceives us. *Answer.* We know by the sight nothing but the color of the sun; its place, size, etc., are inferred by inductive reasoning.

3. But even the color of the sun is not such as we see it when modified by the atmosphere. *Answer.* We do not claim certainty except for what we perceive; now, we perceive by the sight the color such as it is when it reaches our eyes; with anything else the sense of sight has nothing to do.

4. But the sight distorts its objects; thus, a square tower appears round in the distance. *Answer.* The sight reports only the colors of the different parts of the tower; all inference as to its shape, size, etc., are conclusions of inductive reasoning, which is often too imperfect to give certainty.

5. By admitting that the senses must be concordant and constant in their testimony, we imply that each sense singly can be mistaken in certain cases, at least for a while. *Answer.* All we imply is that the senses give no sufficient ground for certainty till we have

examined whether all the conditions are complied with.

6. When I see a stick plunged into water, I see it broken where it touches the surface; here my sight deceives me. *Answer.* My sight reports the truth, viz.: that the stick appears as if broken.

7. Then our senses can report appearances only; *e. g.*, that I see the appearance of a man, not that I see a man. *Answer.* Sense apprehends appearances only; but our intellect understands that appearances are accidents which naturally exist in substances. When I see the appearance of a man, I understand there must be a cause for that appearance; and, by attending to all the circumstances of the particular case, my mind soon forms a judgment, often absolutely certain, that on the present occasion the appearance of the man is due to the reality of his presence.

8. That our senses may be relied on, we must first know that the order of nature is constant; but we cannot learn this except from the testimony of the senses; therefore we cannot reason on this subject except in a vicious circle. *Answer.* We deny the major and the supposition that we need to reason at all in order to see the evidence of the common and the proper objects of sense, when the required conditions are attended to. We see color, we feel heat and resistance immediately.

9. A color, odor, taste, etc., may please one man and displease another; therefore different men must apprehend objects differently; therefore all do not apprehend them correctly. *Answer.* The apprehensions are the same, but they do not suit all alike. As the organs of men are substantially alike in structure, with

only accidental differences, we reasonably judge that the apprehensions of all men by sense are substantially the same, with only accidental differences. But the pleasure arising from colors and sounds is mostly due to associations of phantasms and sentiments; thus, orange and green please persons of different parties. Odors and tastes, being intended by the Creator to guide us in the selection of suitable food according to our varying bodily conditions, though identical in kind, will often please one and displease another, according to our several needs, thus displaying the wonderful wisdom with which Providence adapts means to an end.

10. In the Holy Eucharist the senses are deceived. *Answer.* They apprehend the appearances which really exist, and thus there is no deception of the senses.

11. Persons who are color-blind misjudge colors. *Answer.* Rather, they are unable to distinguish colors sufficiently to judge with certainty.

Article IV. Authority.

152. Consciousness and intellect put us into direct communication with objective truth, of which they see the evidence. Their perceptions are called **intuitions**, *i. e.*, visions of truth. It is the same with our sense-perceptions of the proper and the common objects of sense: they, too, give us intuitions or immediate evidence. Reasoning brings evidence to us in a more circuitous way; it gives **mediate evidence.** Such, too, is the evidence of sense-perceptions with regard to all testimony that implies the process of induction; *e. g.*, I have only mediate evidence by my sight of the distances of objects; for any judgment I pronounce on that subject is derived from observation and induction united.

153. **Authority** gives us certainty in a still more circuitous way; for it brings us into communication with truth by means of the statements of other persons. The truth thus reached is said to be *believed*, and authority is called an *extrinsic* motive of certainty. **Belief**, or faith, is Divine or human, according as the authority on which it rests is Divine or human. In Philosophy we are concerned with human faith; and the question to be now considered is, whether the authority of human witnesses can be relied upon to give perfect certainty.

154. **Thesis XIII.** *The testimony of men, under proper conditions, can give perfect certainty.*

The **conditions** required are: 1. That the facts testified to are sufficiently open or accessible to observation; 2. That they are of great moment; else they might not be noticed carefully; 3. That the witnesses are sensible men; 4. That they are either undoubtedly sincere, or, if not, that they are many, of sufficiently different characters, opinions, parties, interests, etc., to exclude all reasonable suspicion of collusion in the support of false statements. *Proof.* That testimony gives perfect certainty which convinces us beyond all reasonable doubt that the witnesses could not have been deceived themselves and did not wish to deceive us. But such is the testimony which fulfils the conditions just stated.

For: 1. *The witnesses could not have been deceived*, since: (*a*) The facts are supposed to be open, accessible to observation; (*b*) They are of great moment, so as to invite careful examination; (*c*) The witnesses are sensible men, who do not act rashly and are not easily imposed upon; and, besides, they are of different opinions, characters, etc., so as not to make a mistake in common.

2. *They do not wish to deceive us;* since either they are known for certain to be sincere, and, of course, such men do

not wish to deceive; or, if not certainly sincere, they are supposed to be many, of different characters, opinions, parties, interests, etc. Now, sensible men do not lie wantonly, especially on matters of importance; and, least of all, would they combine to propagate an important falsehood, unless some common grave interest led them into so disgraceful a crime. But they are supposed to have no such interest in common. There is, consequently, no reason to doubt their testimony.

155. **Objections:** 1. Each witness gives only probability, and no number of probabilities can make up certainty. *Answer.* Even one witness who is certainly intelligent, prudent, and sincere may give perfect certainty; but if the testimony of one or several still leaves special reasons to doubt, the testimony of others may show that the doubt is unfounded in the present case; certainty is thus attained, not by an accumulation of probabilities, but by the elimination of all motives for reasonable doubt.

2. Every witness is free to deceive. *Answer.* We can know from the conditions laid down that, in a given case, there was no actual attempt at deceit. Every man is free to commit suicide, and still it is certain that they will not all do so.

3. History contains many falsehoods. *Answer.* We do not defend all history.

4. At least, we cannot be certain of events long since past, because traditions are gradually changed. *Answer.* We can often be certain of such events, viz., when we know that, in a given instance, the tradition was not changed; *e. g.*, we know for certain that Christ died on a cross; that He rose again; that His disciples preached His Resurrection; that they had no motive to do so if He had not risen; that they laid

down their lives in testimony of their sincerity, etc. (See this argument more fully treated in Schouppe's *Course of Religious Instruction*, p. 6.)

5. At least, no amount of testimony can make miracles certain; for it is physically certain that they never occurred, while it is at most only morally certain that they did. *Answer.* It is not physically certain that they never occurred; all that is physically certain is that nature has no power to produce them, but the Lord of nature has; and it is morally certain that they have occurred.
6. Still, plain men could not assure us that any particular miracle was performed; for they are not fit judges of what is miraculous. *Answer.* Sensible men, even though unlearned, can give reliable testimony about obvious facts, of which learned men will judge whether they were natural or beyond all natural power.

Article V. Common Sense.

156. There are many unwavering judgments or convictions common to all men of sound minds; all these may in a wider meaning be called dictates of **common sense**, *i. e.*, of that sense or intellect which belongs in common to all men. Some of these judgments proceed from the testimony of consciousness, others from the immediate intuitions of identity between two ideas, others from intellect and sense-perceptions combined, others are the obvious deductions of reason from intuitive principles and from the perceptions of the senses. But the term common sense, when considered as a special motive of certainty, is taken in a **more restricted meaning**; it comprises those judgments only, common to all sensible men, which are not immediately or intuitively evident, and which are concerned with the direction of moral conduct.

157. The following are **examples** of common-sense judgments: "There is a sovereign Lord and Master of all things," "His Providence directs human affairs," "We must reverence Him," "We must obey His laws," "He is the rewarder of good and evil," "Our soul will survive our body," "There are rewards and punishments after death," "Children must honor and obey their parents," "Friends must help each other," "Brutes may be killed for the use of man," "Men cannot be killed without just cause," etc.

158. To find how far the judgments of common sense are reliable, we must carefully consider whence they proceed and what evidence they give us of the objective truth. We should not suppose that they proceed from the universal consent of men; men agree because each of them individually forms the same judgments, but each one separately does not form them because all agree: **universality is a character, not a cause** of them.

159. True, we may accept a judgment on the authority of men if their united testimony is known to us; but we are then influenced by another motive of certainty, viz., **common consent.** Thus, we may believe that man is fallen from an originally happier condition, because most nations have traditions to that effect; but the judgments of common sense are very different, being formed by each one independently of the consent of others.

160. Nor should we suppose that the judgments of common sense proceed, as Reid and his followers of the Scottish School maintain, from a mere **instinct to believe** certain truths. These writers wished to refute the Scepticism of Hume by the weapon of common sense; but they failed to establish the reliability of common sense by making it a mere blind instinct.

161. Whence, then, do the judgments of common sense

derive their validity? From the evidence of the objective truth, which is presented with sufficient clearness to every sound mind. The objective truth in such cases is not intuitively beheld; we do not see immediately God's existence, nor the action of His providence; nor the soul as surviving the body, nor one being called virtue and another vice; but, starting with premises supplied by sense-perceptions and intellectual action, we go through an **obvious process of reasoning**, of which the evident conclusions are the dictates of common sense. For instance, my senses seize upon the fact of the world's existence, my intellect sees there must be a reason for its existence; and, not finding that reason in the world itself, my mind concludes by an obvious process of reasoning that there is a first cause of the world, distinct from it; besides, since we also understand that a thing made belongs to its maker, we conceive the Cause of this world as the Sovereign Lord and Master of all things, etc. The judgments of common sense, therefore, are reliable, because they are evident conclusions derived from evident premises.

162. This motive of certainty is, then, not entirely distinct from the motives already considered; but it has a special **advantage**, viz., that it furnishes us with a summary proof of many most important propositions, the detailed study of which would require lengthy explanations.

163. **Thesis XIV.** *The judgments of common sense are true.*

Proof. According to the principles that underlie inductive reasoning (No. 47), any constant, uniform, and unvarying effect produced by any class of objects must proceed from the very nature of those objects; but these judgments are constant, uniform, and unvarying in man; therefore they have for cause the very nature of man: in other words, it is natural or essential to man to form these judgments. Now, it cannot

be natural or essential to man to form false judgments; else universal doubt would follow, which, however, has been proved to be absurd; therefore these judgments are not false, but true.

164. **Objections**: 1. Such judgments may have come from tradition, education, prejudices, human laws, etc. *Answer.* The effect cannot exceed the cause: all these causes are variable among men, except just so far as they can be traced to the very nature of man. Besides, mere traditions, etc., would not impose on the consciences of all so stern a sense of duty as belongs to the dictates of common sense.

2. These judgments might come from the passions of men. *Answer.* On the contrary, our passions would rather prompt us to deny these very judgments.

3. Huxley says that religion has been developed from men's instinctive belief in ghosts. *Answer.* Huxley's theory is, as usual with him, a mere theory unsupported by valid proof. The very fact that so determined and able an opponent of religion cannot adduce any more plausible theory to account for the conviction of mankind, is a strong presumption in favor of our thesis.

4. Ignorant men cannot reason well enough to form such judgments; therefore they only receive them from others. *Answer.* The reasoning in question is not difficult, but easy and obvious; though it is not pretended that every mind can give a philosophic account of its own reasonings.

5. Even great geniuses do not always see those conclusions. *Answer.* Geniuses often strive after originality of thought more than after truth, in order to make themselves a name; proud minds disdain to follow the beaten path, simply because it is the beaten path. (See further *Metaphysics*, No. 225.)

CHAPTER IV.

THE ULTIMATE CRITERION OF CERTAINTY.

165. The various sources of certainty, examined in the preceding chapter, furnish us *motives of certainty*, *i. e.*, reasons which move our intellect to elicit firm undoubting judgments. But these several sources do not give certainty except when properly applied to their proper objects; *e. g.*, our senses are not reliable except under the proper conditions. Hence, to have philosophic certainty in any given case, we must examine whether in that case all the necessary conditions have been complied with, and whether no reason remains to entertain any further doubt. For this purpose we need a rule or test by which to judge our very judgments; to ascertain beyond the possibility of error that they are conformable to the objective truth. This rule to judge by is called a **criterion** (*κρίνω*, I judge) of certainty.

166. We maintain that **the ultimate and universal criterion of certainty** is *the evidence of the objective truth.* By calling it *ultimate*, or *last*, we mean that, when this criterion is applied, it leaves no room for further inquiry concerning the existence of certainty; the ultimate criterion answers the last question that we can or need ask in examining the reliability of our knowledge. For instance, if I question myself how I know that bodies exist, I answer that I see and feel them, that by my senses I perceive their existence, and I cannot perceive that which does not exist as an object of perception; in other words, their existence is made evident

to me. If asked why I am certain that the Declaration of Independence occurred in the United States, I answer that I have learned it from reliable witnesses. And why do I believe these witnesses? Because my reason convinces me that their testimony is reliable. But why do I rely on my reason? Because it gives me evident conclusions from certain premises. I can question no further, because I can wish for nothing more evident than evidence.

By calling evidence the *universal* criterion of certainty, we mean that evidence is the crucial test in *all* cases of natural certainty; for it is with natural certainty alone, not with supernatural Faith, that Philosophy is concerned.

167. **What, then, is evidence?** It is important to understand it well, since all certainty is ultimately to be tested by this criterion. As stated above (No. 84), in the analysis of certainty we find that the firm adhesion of our mind to a truth, excluding all fear of error, is the *subjective* element of certainty; and the manifestation of the truth to the mind producing this firm adhesion, is the *objective* element. Now, such manifestation is the evidence of that truth. Evidence is to the mind what the visibility of a body is to the eye. That I may see a body, 1. It must exist; 2. It must give forth, or at least reflect, rays of light; 3. By that light it must impress itself on my eye. So, likewise, that a truth may be evident to me, 1. It must exist; 2. It must shine forth by its intelligibility, as all truth does, for ontological truth is the intelligibility of a thing; 3. Its light or intelligibility must be so presented as to force itself upon my intellect, making me see that the thing is so and must be so, cannot be otherwise. Hence a usual and correct **definition of evidence** is "such a manifestation of a truth as makes us see that the thing is so and cannot be otherwise," or, more briefly, "the manifest necessity of a truth." We do not mean here that the

objective truth is *absolutely* necessary, but only that, *if* I see it, it *must* be, else I could not see it; the truth is *hypothetically* necessary.

168. Before Descartes' time, the fact that evidence is the ultimate criterion of certainty was scarcely disputed; but this writer has so confused the question of certainty that many modern philosophers have assigned and defended false criteria. Descartes himself considers *clear ideas* as the great test or principle of certainty; while Reid, and the Scottish School generally, rely ultimately upon what they call *common sense*, by which they mean a blind instinct to consider a thing as true. But they should prove that such ideas or such an instinct is necessarily a pledge of the objective truth. In fact, these criteria are all internal; now, **no merely internal test** can settle the question whether the external things exist, since it is not necessarily connected with the objective truth.

Others look for the criterion in a merely external rule. Thus, De Lamennais, indignant that human reason had been adored in France during the Reign of Terror, strove to discredit reason and to show that we cannot trust our reason, but must test its reliability by comparing its judgments with the *common consent* of men. But how can we know that men are agreed upon any point, unless we can rely on our senses and our reason to ascertain whether men exist and what they say? **No merely external test** can be ultimate; for we need a further criterion to judge of its existence and its reliability.

169. **Thesis XV.** *The evidence of the objective truth is the ultimate and universal criterion of certainty.*

Proof. It is such if it fulfils the following conditions: 1. To be *a reliable test* of truth, the criterion must be inseparable from the truth, so that it cannot exist without the truth. 2. To be *ultimate*, it must leave no doubt to be removed by a further test. 3. To be *universal*, it must be applicable to

every motive of natural certainty. Now, the evidence of the objective truth, and it alone, fulfils all these conditions: 1. It cannot exist without the truth, since it is the intelligibility of the truth itself made manifest to us. 2. It leaves no doubt to be removed by a further test, since it enables the mind to see the necessity of the truth manifested to it. 3. It is universal, for in no case have we real certainty unless we see that the truth is so and cannot be otherwise; but this supposes the evidence of the objective truth, and is nothing else than the perception of that evidence. Therefore this evidence is the ultimate and universal criterion of certainty.

170. **Objections**: 1. We cannot be certain of anything unless we know that others agree with us. *Answer.* We deny this. In fact, we could not know that others agree with us if our own faculties were not reliable, capable of seeing the evidence of that agreement.

2. We cannot know that we are not insane except by ascertaining that others agree with us. *Answer.* This, too, we deny. Besides, even an insane man cannot err when he has evidence; but he has not evidence in the matters wherein he is insane; for evidence is a manifestation of the truth. It must, besides, be remembered that we claim certainty for man in his normal state, not for crazy, drunken, or sleeping men; and the very reason why these cannot be certain is because they cannot reflect sufficiently to examine their judgments: they imagine that things are so, but they cannot *see* that things cannot be otherwise.

3. Evidence is only in our minds. *Answer.* True evidence is the light of objective truth perceived by our minds; that which is not cannot be perceived.

4. We cannot be certain that we have evidence. *Answer.* We can, as our consciousness testifies.

5. Every man is fallible. *Answer.* Not about matters that are evident.
6. We have no infallible knowledge except through Revelation. *Answer.* We have; and we could not rationally trust a Revelation if we had no evidence that it was made: those who attack the reliability of our reason thereby attack the foundation of Faith.
7. God is the ultimate motive of certainty. *Answer.* He is the first being existing and knowing, but not the first being known to me: His existence is first ontologically, not logically, with regard to me.
8. Consciousness is the ultimate criterion of certainty; for it answers the last question asked about the motives of certainty. *Answer.* We trust our consciousness because it is evidently reliable, thus evidence is the ultimate criterion.
9. Evidence itself requires attention and examination. *Answer.* As motives of assent, no; as necessary conditions for the existence of subjective evidence, yes.
10. Evidence does not reach all kinds of truth; for instance, we have no evidence of what we learn from witnesses. *Answer.* We have no intrinsic evidence of it, but extrinsic, *i. e*, we have evidence that the witnesses could not deceive us.
11. An evident conclusion may be false. *Answer.* Not if the whole reasoning is evident, premises and sequence.
12. It is the part of Protestantism to make one's own judgment the criterion of all certainty. *Answer.* Protestantism errs in making private judgment the criterion of supernatural certainty.
13. Many truths are certain, but not evident. *Answer.* Of natural truths all that are certain are either intrinsically or extrinsically, directly or indirectly, evident to man's natural powers.

INTRODUCTION.

1. The word **Physics** means etymologically the study of nature (φύσις, nature); but even the ancient Greeks restricted the meaning of the term to the sensible or phenomenal properties of the material world. At present the meaning of Physics is still more limited: it now denotes that branch only of the Natural Sciences which explains the sensible properties of *bodies in general*, and the causes (such as gravitation, heat, light, magnetism, etc.) which modify those properties. It is thus distinguished from the sciences of Astronomy, Chemistry, Biology, etc., which deal specially with the sensible properties of only certain classes of bodies.

2. **Metaphysics** is the science of whatever is not sensible, of what lies beyond the reach of the senses, as far as it is cognoscible by human reason. It belongs to the *genus* science,—*i. e.*, the certain and evident cognition of things by their causes; and it is the highest among the purely human sciences, for it traces its knowledge to the highest causes accessible to human reason. Its *specific difference* lies in dealing with whatever is beyond the reach of the senses, the non-sensible being its formal object; whether this be found in spiritual beings, totally beyond the reach of sense, or in material things in as far as these do not affect the senses.

3. What sensation cannot perceive is the formal object of our mind or intellect, the special functions of which are

abstraction and generalization; therefore *abstract and universal knowledge, as such,* is the **formal object of Metaphysics.** Hence this science, being distinctively intellectual, is also denominated 'Intellectual Philosophy,' or 'Mental Philosophy'; while the application of these abstract truths to the moral conduct of men is styled 'Ethics,' or 'Moral Philosophy.'

4. **Metaphysics is divided** into two parts: 1. **General Metaphysics** studies the non-sensible in general, its principal object is 'being,' as such; it is therefore called **Ontology,** or the science of being (*ὄντα,* beings). 2. **Special Metaphysics** studies what is peculiar to special classes of beings; it comprises *Cosmology,* which treats of the material world (*κόσμος,* the world); *Natural Theology,* which treats of the knowledge of God (*Θεός,* God), as far as He is knowable by merely natural means; and *Psychology,* which treats of living things (*ψυχή,* the vital principle), especially of the human soul. Metaphysics does not treat professedly of the Angels, because their existence is not known to us except by Revelation. Some modern Metaphysicians, confining Psychology to the study of the human soul, treat separately of organic bodies under the title of 'Organology,' or 'Biology' (*βίος,* life). Others consider all that is peculiar to man under the head of 'Anthropology.' The division which we have given above is the oldest and, even now, the most commonly adopted.

BOOK I.

GENERAL METAPHYSICS; OR ONTOLOGY.

5. **Ontology** is the science of 'being.' It examines: 1. The nature of being. 2. The transcendental attributes of being. 3. The Categories, or highest genera of beings. 4. The most important link that unites all classes of beings, viz., the relation of cause and effect. 5. The most important perfections of beings.

CHAPTER I.

THE NATURE OF BEING.

6. We shall consider: 1. The meaning of the term 'being.' 2. Possible being in particular. 3. The essence and the existence of beings. 4. The primary philosophical principles derived from the study of being.

ARTICLE I. THE MEANING OF THE TERM 'BEING.'

7. The term **being**, when used as a participle, is a synonyme of 'existing'; as a substantive it expresses the one mark or note common to all that can become the object of thought. It is not, then, confined to *actual* being, but it includes also *possible* being; for we can think, *e. g.*, of golden stars, and

other things only possible. It is not confined to substances, but is also applicable to accidents and relations; *e. g.*, we can think, not only of a tree, but also of its vitality, its color, its age, etc. Even a mere negation, *e. g.*, darkness, may be called being, because we can think of it. Yet, because we cannot think of it except by way of negation of something else—darkness denoting the absence of light—such an object of thought is not called a real being. But we call a **real being** whatever may be known or thought of positively and by itself, whether it is actually existing or only possible,—*i. e.*, capable of existing. That which is not a real being, but the absence of a real being, is a **mere figment of reason,** or *ens rationis*, as it is called by the Schoolmen. This same term is applied to whatever is intrinsically impossible, *e. g.*, a square circle.

8. Real being, viewed as such, is the **formal object of Metaphysics.** In English, the word 'thing' is used as an exact synonyme for real being, except when it is taken in a special sense as opposed to persons, as when we say 'persons and things.' Thus, we say a tree is a thing, its size is something, its fertility is something; blindness is not a real thing, but the absence of something real, etc.

9. Being is called a **transcendental,*** *i. e.*, a note common to all things, and thus transcending any genus or species. Still, it must be noticed that when we say 'a tree is a being,' 'its color is a being,' 'its age is a being,' etc., we evidently take the word 'being' in senses somewhat different from one another; the term being is not taken *univocally* but *analogously.*

10. The **analogy** in this case is not that of mere *proportion* or resemblance; for there is more than resemblance

*Kant attached a new meaning to the term 'transcendental,' viz.: Whatever is beyond the reach of experience. He has thus created a confusion of ideas in many minds.

between the meanings of being; there is identity to a certain extent; it is the analogy of *attribution.* It is called *intrinsic*, because the note expressed by 'being' is contained in every being, and not merely attributed to one owing to some extrinsic relation with another being. But the mere *ens rationis* is called being by an analogy of proportion only, not of intrinsic attribution.

11. We must also distinguish between a *physical* and a *logical* being. Both may be real beings, but analogously. **Logical** being is being viewed as a mere object of knowledge, and therefore it can exist in the mind only, *e. g.*, all universals, all abstract ideas. **Physical** being can exist out of the mind, *e. g.*, this house, two houses, the Angel Gabriel, etc. Still the mind itself has also physical being, and so have its acts, viewed as modifications of the mind; but the terms of its acts, mental terms, have only logical being. All physical being is real being; a logical being is real when it is not an *ens rationis.*

Logical, as distinct from physical being, is the object of Logic.

12. A third distinction lies between *actual* and *possible* being; **actual** here means 'existing,' and **possible** means 'capable of existing.' Both actual being and possible being are real being, provided they be not negative.

13. **Thesis I.** *The term being does not express a genus of which the different classes of beings are the species. Proof* 1. A genus is univocally predicable of all its species; but being is not univocally predicable of all classes of beings, as we have explained (No. 9); therefore being is not a genus of which the different classes of beings are the species. *Proof* 2. If we examine with care how individuals are classified into species, and these into a genus, we shall perceive that the note which constitutes the difference between the

species is a something added to the genus, and not included in the notes which constitute that genus, *e. g.*, 'rational,' which marks the difference between rational and irrational animals, is not contained in the genus animal, but added to it in man and not added in the brute. Therefore, if 'being' were a genus, the difference that would be added to it in order to make a species would be something distinct from it, something not being. But there is nothing which is not being. Therefore no such difference can be added. Therefore being is not a genus; it may at most be called a *quasi-genus*, as bearing some resemblance to a genus.

14. Since being is not a genus, different classes of beings, *e. g.*, substance and accident, finite and infinite being, etc., are not species of beings; but they are called **determinations of being**,—*i. e.*, when I think of a substance, I do not think of a being with something else added to it, but of a being more clearly or less vaguely understood. As when a man looks through a telescope and vaguely discerns something, he knows not what; then, after focussing his instrument and looking again, he sees the same thing, recognizing it to be a ship, and such an individual ship; so when we see being as substance, we see no more than being, but we see it more distinctly; in short, being has not received an addition but a determination. (See this matter fully explained in the excellent work of Rev. Thomas Harper, S.J., *The Metaphysics of the Schools*, vol. i., Props. IV., V.)

15. **Thesis II.** *The idea of being in general is not the idea of the Infinite Being.*

Explanation. This thesis is a most important application of the abstract truths so far considered. It strikes at the root of a philosophic system advocated by the Ontologists, whom we shall refute more directly in our treatise on Psychology (Nos. 187, 188).

Proof 1. The idea of being in general is very indefinite, that of the Infinite Being, or God, is very definite; for the former denotes any being, no matter how imperfect, the latter the union of all perfection in one Being.

Proof 2. Being in general is an abstraction, having only a logical entity; for no being can have physical existence except as a singular concrete being. Now, the Infinite Being has physical and concrete existence, existing not in general, but in an individual nature.

Proof 3. Being is not even predicated univocally of God and of any creature, but only analogically; because the being of all other things is distinct from their actual existence, for other beings may be actual or possible; whereas in God it is not distinct from existence, for a possible God would be no God at all.

True, the scholastic term *ens simpliciter*, 'simply being,' is predicated of God and of being in general, but in different significations; God is simply being, *i. e.*, being without any non-being; being in general is simply being, *i. e.*, being without specification.

How, then, do we get the idea of infinity? We perceive beings which have a certain amount of perfection and no more; we distinguish between perfection and limit, or the absence of further perfection; next, by our power of abstracting, we mentally remove all limit, and thus conceive abstractedly perfection without limit, *i. e.*, infinity.

16. **Objections:**

1. The idea of God is the first idea, but the idea of being in general is the first idea which our mind conceives; therefore, the idea of God and that of being in general are the same. *Answer.* Our idea of God is our idea of the first being, but it is not our first idea: God is first in the order of being or

LIBRARY OF THE UNIVERSITY

ontologically, but He is not first revealed to our knowledge, not first logically.

2. God is the first truth. *Answer.* In Himself, yes; the first truth known to us, no.
3. From the finite we could never form the idea of the infinite: therefore we see the infinite directly. *Answer.* From the finite we could not form the intuitive perception of the infinite; but we can, by mentally removing all limits, form the abstract concept or idea of the infinite.
4. We could not understand what finite means unless we first understood the meaning of infinite; for the finite is only the negation of the infinite. *Answer.* The finite is not the negation of the infinite: it is the complex notion of 'being with limits'; now we see both 'being' and 'limits' all about us, we have only to conceive and unite those two notes in order to conceive the idea of finite.
5. If God is not admitted to be our first idea, we cannot prove the objective reality of our knowledge. *Answer.* In Critical Logic, the objective reality of our knowledge is proved without such admission.

Article II. Possible Being.

17. A being is **possible** if it can exist. Possibility is twofold: *intrinsic* and *extrinsic.* A thing is **intrinsically** or internally possible if the notes of which it consists do not exclude one another; thus a mountain of jewels is possible, but a square triangle is impossible.

A thing is externally or **extrinsically** possible when there exists a power that can produce it; now, because the power of God is infinite, everything that is intrinsically possible is also extrinsically possible to God.

18. That which can be produced by no created power is said to be **physically** impossible. We call an act **morally** impossible when it might, indeed, be done by man, but, considering the uncommon difficulty of the act and the weakness of man, it would scarcely ever be done. Thus, it is morally impossible for a man to be always so careful as never to make any mistakes.

19. We get **our knowledge of what is possible** from the consideration of what is actual. Our imagination can combine various phantasms of material things perceived into new phantasms of things imaginable. Our intellect can combine notes of actual things which have become known to us, and form from them new concepts of merely possible things; but neither the imagination nor the intellect can combine elements that contradict each other; thus, we can neither imagine nor conceive a triangular circle.

20. **God's knowledge of possible creatures** is not derived from the consideration of actual creatures; but, understanding His own essence adequately, He saw from eternity how it could be imitated, or represented, by an endless variety of creatures. His infinite wisdom thus formed in itself the *exemplars* of all possible things, in a manner analogous to that in which an architect conceives the plans of various structures which he can erect. Thus, all things have not only their existence from God when they are created, but even their intelligible nature before creation; for God's intellect plans them.

21. **We do not intuitively behold the exemplars** as they are in the mind of God; but, when we conceive possible things, our concepts are conformable to those exemplars, except, of course, when our concepts imply a false judgment. The reason is that both God's concepts and ours are founded upon the same truth, viz.: that the notes which make up a possible

being can exist together. Various false views have been taken of these possibles by various philosophers, whom we shall now refute.

22. **Thesis III.** *The internal possibility of things does not formally depend on the power nor on the will of God.*

Proof. To say that the internal possibility of things depends formally on the power or on the will of God would mean that God's power as such, or His will as such, determined the difference between what is possible and what is impossible. But this cannot be.

1. God's *power* cannot determine the difference between possible and impossible; else certain things would be impossible simply and formally because the power of God did not extend to them, and thus the power of God would be limited.
2. God's *will* cannot determine this difference, else He could will the impossible to be possible; He could will that notes which contradict each other should nevertheless exist together, *e. g.*, that a circle should be square, that a truth should be false, that a thing could 'be and not be' at the same time; thus all certainty would vanish and universal scepticism would result.

23. **Objections:**

1. If God cannot make the impossible possible, He cannot do all things. *Answer.* This we deny; *an absurdity* is not a thing, a real being; *e.g.*, a triangular square would be a square that is not a square, but this is not thinkable, not intelligible, not a real being (No. 7).
2. Then God in creating would not be independent, He would depend on the possibles. *Answer.* The possibles themselves depend on His wisdom, and thus His dependence would not be on any existing being except Himself, for the possibles have no existence.

3. Then God would not create things out of nothing, but out of their possibility. *Answer.* He creates things out of nothing, actual or pre-existing; for the possibility is nothing actual, nothing existing.
4. If possibles have no existence, how can God know them? *Answer.* From eternity He knows His existing essence as capable of being imitated by beings which do not exist from eternity.
5. If it were not for the power and will of God, nothing were possible; therefore the possibles depend on His power and will. *Answer.* Nothing would then be *externally* possible; we grant that the external possibility of things depends on God's power and will.

24. **Thesis IV.** *The internal possibility of things depends on the intellect of God.*

Proof. The internal possibility of a thing consists in the agreement between its notes; not an actual agreement between actual or existing notes, but a merely logical agreement between notes considered as possible. Now, whatever is merely logical being depends on an intellect which conceives the notes and the agreement between them; therefore the internal possibility of a thing depends on an intellect; and since all things internally possible were so from eternity, their possibility depends on an eternal intellect, *i. e.*, on the intellect of God.

25. **Objections:**

1. Even if we supposed that God did not exist, a round circle would still be internally possible. *Answer.* (*a*) From an absurd supposition it is no wonder if we get any consequence. (*b*) Nothing would be internally possible if there were no mind to conceive notes and associate them.
2. We can think of possibles without thinking of God;

therefore they do not depend on God. *Answer.* We cannot fully understand them without referring them to the intellect of God. From the fact that we do not always think of them as dependent on God, it does not follow that they are not dependent on Him, but simply that we view them imperfectly.

26. **Thesis V.** *The internal possibility of things depends on the essence of God.*

Proof. God, being infinitely perfect, cannot be dependent for the knowledge of His intellect, except on Himself, on His own essence; but He knows all possible things; therefore, He must know them in His essence; but He does not know them as existing in His essence; therefore, He can only know them as having their source in His essence, as dependent on His essence; therefore, they depend on it.

Are, then, the possibles the Divine essence? No; the possibles, as such, or formally considered, have no actual entity, and therefore they cannot be the Divine essence, which has actual entity. But whatever foundation there was from eternity for the formation of these logical concepts, that foundation must have been something actual, and, therefore, identical with the essence of God.

27. **Objections:**

1. God must then have an infinite number of these concepts; but an infinite number of existing things is absurd. *Answer.* God understands all things by one concept, which embraces all that is knowable. Even we, in one concept of a line, embrace any number of parts into which it may be divided. The possibles are numberless (see No. 38); and they are not existing things, as the objection supposes them to be.
2. This explanation makes all things part of God's essence, and thus leads to Pantheism. *Answer.* It

makes all things finite imitations of God's infinite essence.

3. Knowledge supposes its objects and does not make them; hence the Divine intellect supposes the possibles and does not form them. *Answer.* The knowledge of the architect supposes his knowledge of the materials which he is to combine in his plans; thus, also, the intellect of God sees all perfections in His own essence, and understands how imitations of those perfections can be variously combined in finite beings.

Article III. Essence and Existence of Beings.

28. The **essence** of a being is that collection of notes which must be conceived to understand that being, because they make it what it is and distinguish it from every being of another species: the essence (from *esse*, to be) answers the question, 'What is it?' '*Quid est?*' and is also called the 'quiddity.' For instance, the essence of a syllogism is "an argument consisting of three propositions so connected that from two of them the third follows." If any one of these notes is wanting, we have no syllogism, and if any of them is not apprehended, we do not apprehend the syllogism.

29. In its **widest sense**, the term essence is applied to anything, be it substance, property, or accident; for everything has notes which make it what it is, and about everything we can ask, 'What is it?' *e. g.*, What is color? what is figure? what is time? etc. But in a **stricter sense**, essence is said of substance only, and expresses the species to which that substance belongs; *e. g.*, the essence of man is rational animal, or a being composed of body and soul.

30. The essence of a substance may be viewed in two

ways: 1. The real or **physical essence** is the essence as it exists in the substance independently of our way of conceiving it. We conceive the physical essence when we conceive a being as composed of those elements which are really distinct in that being; and we express that physical essence by mentioning the parts really distinct, as body and soul in man. 2. The notional or **metaphysical essence** is the essence conceived as made up of parts which are not really, but only logically distinct. It is expressed by mentioning qualities which do not correspond to distinct parts; as when we call a man a rational animal. For we must not suppose that the animal and the rational are two distinct parts that make up man, as body and soul do, but the animal itself is rational; and if the rational part of man be taken away, there remains not an animal but an inanimate body.

31. **Are essences eternal and immutable?** In their physical existence, essences are not eternal, but created in time; but they may be called immutable, inasmuch as they remain while the substance lasts, for the accidents alone are changed. In their logical entity or intelligibility, essences are eternal and immutable, inasmuch as it ever is and ever was true, *e. g.*, that an intellect supposes a simple substance, that a part is less than the whole, etc.

32. It is clear that **we know the essences** of the things which we make or invent ourselves, as of a watch, a table, etc. We also know the essences of many things in nature, as of a fruit, a tree, an animal, the intellect, etc.; else, we could have no science about such things, since science treats not of singular things but of the essences of things. Still there are many natural agents of which we do not know the specific essences, *e. g.*, heat, electricity, magnetism, etc.; we know what they do, but not what they are. We define

such things by mentioning a genus to which they are known to belong, and, as the difference, we mention the effects which are peculiar to them; thus, we know that electricity has the power to produce certain effects, but we do not know whether it is a distinct substance or a modification of a substance; if it is a distinct substance, we do not know whether it is simple or compound.

33. **Existence** is a simple and primary concept, which, therefore, cannot be defined; the word is said to come from *ex-sistentia*, a standing forth out of its causes. By receiving existence, a possible being becomes actual; *e. g.*, Plato was possible and became actual. Are, then, existence and actual essence the same? This question is usually answered thus: "Between actual essence and its existence there is no real distinction, but only a logical distinction founded on reality." (See Harper's *Metaphysics of the Schools*, vol. i., Prop. XVI.)

34. The essence considered as the principle of actions is called the **nature** of a being. If, therefore, the actions of a being are sufficiently known, and are found to be uniform and constant, we can safely infer attributes belonging to the nature and essence of that being; thus, from the intellectual acts of man we infer the simplicity of his soul. The knowledge thus acquired is true and certain, for it rests on the evident principle that there must be a proportion between an effect and its cause. Therefore Locke and the positive philosophers are entirely mistaken when they teach that we know nothing but phenomena or sensible facts; we know that those facts can only proceed from proportionate causes, and thus from their effects we know something of the natures and essences of these causes.

ARTICLE IV. THE FIRST PRINCIPLES DERIVED FROM BEING.

35. From the very concept of being we derive analytically three primary judgments or **first principles of reason**, viz.:

1. The principle of *identity:* 'That which is, is,' or 'the being is.'
2. The principle of *contradiction:* 'A thing cannot be and yet not be,' or 'Being is not non-being.'
3. The principle of *the excluded middle:* 'A thing either is or is not.'

It is **a disputed question** whether the principle of identity or that of contradiction should be called the first principle. The two are inseparable, and, when properly understood, imply each other; for when we say, 'That which is, is,' we imply that it cannot not be, and when we say that being is not non-being we imply that it is being. There is no judgment prior in nature to these two, for every possible judgment contains these, and these imply no other judgments.

CHAPTER II.

THE TRANSCENDENTAL ATTRIBUTES OF BEING.

36. An **attribute** or **property,** *strictly* so called, is some note which is not the essence but still necessarily flows from the essence. Now, it is evident that from the essence 'being' nothing can flow which is not itself 'being'; therefore 'being' cannot have attributes or properties in the strict sense of these terms.

But in a **wider sense** we may, by analogy, give the name of attribute or property to any special view taken of being, provided such view can be taken of all and every being. Now, three such views are possible: (*a*) We may deny of every being that it is divided in itself; we do so by saying that it is *one;* oneness or **unity** is intrinsic to every being, and since it denies division it is a negative attribute. (*b*) Considering a being extrinsically, or as related to other beings, we may view it as conformable to knowledge, and call it *true;* **truth** is an extrinsic positive attribute. (*c*) We may also view every being as proportionate to an appetite or desire, and call it *good;* **goodness** is therefore also an extrinsic positive attribute. We shall find no other property which is common to all beings and is not identical with one of these three. These, then, are the only three transcendental properties of being; we shall examine them separately.

37. I. **Every being is one.** The term 'one' adds nothing positive to the being of which it is predicated, but it excludes the idea of many or of division into many; that therefore is called 'one' which is not many, which is not divided in itself.

It differs from 'alone,' which term has reference to something else, denying the existence of another being of the same kind. Still, unity is not always taken in its transcendental sense. When not taken in a transcendental meaning, but as a predicable, **unity may be differently considered.**

1. It is *metaphysical* when the being is not only undivided, but also incapable of division, as a spirit.
2. *Physical*, when nature unites real or separable parts into one whole, as in a tree, a man, a stone.
3. *Artificial*, when the parts are united by human skill, as a table, a clock, a book; this unity may be material or mental. Thus, a history in several volumes is an intellectual or mental unit.
4. *Moral*, when persons are united by a moral bond, as a family, a state.
5. *Accidental*, when the union is a mere aggregation without a bond, as a heap of stones. A being may have one of these unities without having the others. Metaphysical and physical unity make a being one in the proper sense of the word; the other unities make a thing one after a fashion, *secundum quid.*

38. The opposite of 'one' is 'many'; the opposite of unity is **multiplicity.** Many taken together constitute a multitude. A multitude measured by the unit is called a number. To number a multitude we must conceive three things: 1. *Oneness*, for number is formally a collection of units. 2. *Distinction*, or division between the units. 3. Some *similarity* between them. If that similarity is generic or specific, we have a **concrete number**, as five animals, twenty men, etc. If the similarity is only transcendental, we have an **abstract number**, as five, twenty, etc., *i. e.*, so many beings. Thus, also, five men, four plants, and five senses make fourteen things. When we have no definite unit to start with, we

can get no number; thus the arcs contained in a circumference are numberless. Since oneness, distinction, and similarity are conceived by means of abstraction, and abstraction requires an intellect, none but intelligent beings can count. Brutes may perceive many things, but they cannot perceive them as making a number.

39. The unity which a being has with itself or with another is called **identity** or **sameness.** When a being is viewed as the same with itself individually, it is said to be *numerically* identical; when as the same in species with another being, it is *specifically* identical; when as the same in genus, it is *generically* identical. Thus we say that two stone houses are of the same material (generically), two houses built of granite are of the same material (specifically), and when a house is taken down another may be built of the same material (individually).

When a thing ceases to be physically the same, but remains the same in the estimation of men, we denominate the sameness as *moral* identity; thus, a house might be called the same building, though all the parts one after another have been renewed.

40. To identity is opposed **distinction,** which means that one thing is not another. All distinction is either *real* or *logical.* 1. The **real distinction** is between the things themselves, independently of the manner in which the mind apprehends them. It is called a *major* or greater distinction when it is between species, as between man and brute; or between individual substances, as between Cæsar and Cicero; or between parts that can exist separately, as soul and body. The distinction between a substance and its accidents, as between a tree and its size; or between the accidents, as between the color and the taste of an apple, is by some called major, by others minor. The *minor,* or lesser distinction, also called

modal, exists between an entity and its mode. Now, by a mode we mean a manner of being that cannot possibly exist without something of which it is the mode; *e.g.*, figure, for there can be no figure without some quantity that has that figure. 2. The **logical** or mental distinction is between two ideas. It is *purely logical* when the ideas are exactly equivalent, as between a definition and the thing defined. The logical distinction is said to be *virtual*, or *to have a foundation in the reality*, when the concepts are not exactly equivalent, as when I distinguish the reason from the intellect of man, the mercy from the justice of God.

41. Under the head of unity we must also explain **individuality.** It is that unity of a being which makes it precisely this or that being. But what is it that thus individualizes a being? It is not the accidents; thus, a man, for instance, remains the same individual throughout his life, though his accidents are constantly changing, and two grains of sand exactly alike are yet not the same individual grain. St. Thomas puts the principle of individuation in matter, because "matter is incapable of being shared by several beings" (*De Ente et Ess.*, c. v.); and he adds that angels, or separated forms, as he calls them, are not individualized except by their specific notes, so that every Angel is a species by himself. Suarez, on the other hand, puts the principle of individuation in the form. Father Harper suggests that everything, be it matter or form, or compound of both, is intrinsically individualized by its own actual entity, and needs no other note; and thus that everything physically existing, or proximately apt to be brought into existence, is thereby individualized without needing any further principle to give it individuality. (Harper's *Metaph.*, vol. i. pp. 208 to 290.)

42. II. **Truth**, viewed as one of the transcendental properties of being, is metaphysical or ontological truth.

(*Crit. Log.*, c. i. a. i.) It means cognoscibility, or conformity of being to knowledge. As the form of a building is determined by the mind of the architect, so all creatures have their being and cognoscibility from God's intellect. The knowledge of God is therefore the *norma*, or *measure*, by which all created things are measured; while we derive our knowledge from creatures, and therefore these are the measure to which our knowledge must be compared in order to be true. Since God cannot fail of creating what He wants to create, the creature is conformable to His knowledge, and thus there can exist no metaphysical falsity. Things are called *false* only by analogy, inasmuch as some circumstance connected with them is apt to produce logical falsity in our mind. While truth is predicated both of knowledge and of being, still it must be primarily attributed to knowledge; in other words, logical truth is the principal analogue. But logical truth is not a transcendental, since many judgments are not true.

43. III. **Goodness** is being viewed in reference to some desire; it is that which is desired or may be desired. The goodness of a being is founded in its perfection. Now, a being is *perfect* when it has all the constituents that its nature requires, and all the power needed to act for the attainment of its end; if anything requisite be wanting, the being is imperfect. Its perfection is the reason of its goodness, and both are its very being; for anything is desirable in as far as it can perfect the being that desires it, and it can do so in as far as it has being; thus, every being is good inasmuch as it is a being. Still, perfection is logically distinct from goodness; for perfection regards the being itself, and goodness regards it in relation to the being that desires it.

44. Goodness is of **three kinds**:

1. *Becoming, fit*, or *proper*, *i. e.*, conformable to right rea-

son. This, when taken in a stricter sense, is *moral* good, *i. e.*, conformity to reason as regulating free acts; in a wider sense, it also includes natural or *physical* good, *i. e.*, whatever perfects the nature of a subject, as health, knowledge, etc.

2. *Pleasurable, i. e.*, apt to give pleasure, to give satisfaction to an appetite.
3. *Useful, i. e.*, conducive to the attaining of some other good.

True good is that which meets the principal longing of a being, or which meets a secondary longing without injury to the principal; **apparent good** meets a secondary longing to the injury of the principal longing; thus, sensual delights, when they control a man's reason, are to him not true but only apparent good, since they withdraw him from the pursuit of duty and eternal happiness.

45. **Evil** consists in the privation of some due perfection; hence it is not real being, but the absence in a being of something which is due; no being can therefore be all evil or unmixed evil, for then it would be no being at all.

The privation of some physical good is *physical evil*, that of some moral good is *moral evil*, or sin; the latter supposes a free agent who departs from moral goodness. The absence of further perfection is called by Leibnitz *metaphysical evil;* incorrectly, for it may be no evil at all, since evil is a privation of some good that is due, and the perfection wanting may not be due to the creature. It may be asked what good there can be in physical suffering or pain. Pain can answer the purpose of punishment, of trial, of warning, etc., *e. g.*, if fire did not hurt animals it might destroy parts of their bodies without prompting them to protect themselves. Moral suffering, or grief, is chiefly an incentive to virtuous action, *e. g.*, grief for the sufferings of others prompts us to relieve them.

46. Among the good things that are of the agreeable or delectable kind, the most elevated is beauty. **Beauty** is the perfection of an object viewed as a source of pleasure to whoever beholds it. Since it is an object of desire, it is a kind of goodness; but taken in a stricter sense it is distinct from goodness; good things delight the possessor, beautiful things the beholder. We say the 'beholder,' because beauty is primarily predicated of objects seen or beheld: *quæ visa placent*, says St. Thomas. Still the word is also by analogy applied to the objects of other sense-perceptions, *e. g.*, to sound, and even to the objects of intellectual actions, *e. g.*, to virtue. *Physical beauty* is the perfection of natural objects, *intellectual* beauty is that displayed by the intellect, or exhibited by intellectual objects, *moral* beauty is that of virtue, *artistic* beauty that of art.

47. Since perfection as such cannot be perceived but by the intellect, beauty in its proper sense can be appreciated by none but intellectual beings. And because the perfection of an object implies a certain unity combining all its parts in proper proportion for the attaining of its one end, therefore many consider the very essence of beauty to consist in *proportion* or symmetry, and others in *unity amid variety;* but the essence of the beautiful is more correctly expressed by the terms 'manifest perfection,' 'striking excellence,' *splendor veri*, 'the brightness of truth.'

True perfection is **true beauty**; that false appearance of perfection which cannot stand the test of sound criticism is false beauty. The more perfect an object is, the more beautiful it is in itself, *i. e.*, the more capable it is of delighting the beholder; thus, God is infinitely beautiful; and, if He does not please us above all things, it is only because we know Him so imperfectly.

CHAPTER III.

THE CATEGORIES.

48. We have so far explained what is common to all being; we must next consider various classes of beings. Aristotle has pointed out ten highest classes under which all beings can find a place; these are known as the **categories** or **predicaments** (κατηγορεῖν, to predicate), because all that can be predicated of any being is found to belong to these ten categories. Such predicates are found in the answers to the following ten questions: What is the being? How great? What qualities has it? Whose is it? What does it do? What is done to it? Where is it? In what posture? When? How equipped?

49. When we ask what a thing is, the answer will be, either it is a **substance**, *i. e.*, something existing by or in itself, or it is something added to substance; it must be one or other. Substance is the first category. If a thing is not a substance, it is called an **accident**, *i. e.*, something added to a substance. Here accident is not taken in the same meaning in which it occurs in Logic. The logical accident is distinguished from the genus, species, difference, and attribute; the metaphysical accident now spoken of is a mere negation of that special manner of existence which belongs to substance. Accident does not constitute a genus of which the nine classes of accidents, *i. e.*, the nine remaining categories, would be the species; because the 'being' which is predicated of each accident is not taken univocally;—*e. g.*,

qualities, relations, time, place, etc., are accidents of substance, but so different from one another that they have nothing strictly in common which is not identical with that which is peculiar to each; and the mere negation of substantiality cannot constitute a genus; still, accident may be called a *quasi-genus.*

50. An **accident affects the substance** intrinsically or extrinsically:

1. *Intrinsically*, it may affect the substance absolutely or respectively. (*a*) Absolutely, it may affect the substance by reason of the matter, viz., *quantity;* or it may affect it by reason of the form, viz., *quality.* (*b*) Respectively, it affects one thing as connoting another, viz., *relation.*
2. *Extrinsically*, it may denominate the substance by reason of something else which affects it, viz.: its *action*, *passion*, *place*, *time*, *posture*, and *habiliment.* Each of the categories requires further explanation.

We shall treat: 1. Of substance. 2. Of the intrinsic accidents. 3. Of the extrinsic accidents.

Article I. Substance.

51. By our senses we perceive things in the concrete, substance and accidents united. By our intellectual power of abstraction we, from the first dawn of reason, distinguish the quantity, the qualities, etc., of an object from the object itself, *e. g.*, the size and the color of an apple from the substance of the apple. We conceive the object as existing *in* or *by itself*, but the quantity, etc., as existing *in the object.* Philosophy is only the systematic teaching of common sense. Speaking philosophically, we say that a **substance** (*sub-stans*, standing under) is that which exists in or by itself,

and whatever does not thus exist we call an accident. An **accident,** therefore, is that which cannot exist in or by itself, but exists in some *substratum;* accidents are said to inhere in their subject.

52. When we say that **substances exist in or by themselves** (*per se*), we do not mean that they have no cause, that they exist by their own power (*a se*). This was a leading error of **Spinoza,** who, by making all substances thus self-existing, made them all necessary, and therefore identified all things with God.

53. **Hume** has fallen into another error, by teaching that we perceive nothing but qualities, and that what we call substance is only an unreal bond imagined as holding those qualities together; his theory contradicts the intuitions of all men, and leads directly to skepticism. **Leibnitz** makes substance a force or power; but a power is a quality of some being that has the power. **Locke** does not deny that qualities exist in something else, which he calls a *substratum,* but he adds: "Of this supposed something we have no clear, distinct idea at all" (*Human Underst.,* b. ii. c. 23, § 37). **McCosh,** on the other hand, appears to accept the Scholastic and common-sense doctrine when he says: "Now I give up the idea of an unknown *substratum* behind the qualities. I stand up only for what I know. In consciousness we know self, and in sense-perception we know the external objects as existing things exercising qualities. In this is involved what we reckon the true idea of substance. We can as little know the qualities apart from an object exercising them, as we can an object apart from qualities. We know both in one concrete act, and we have the same evidence of the one as of the other" (*Agnosticism of Hume and Huxley*).

54. Substances are distinguished: 1. Into **simple,** *i. e.,*

such as have no parts, and **compound**, *i. e.*, such as have parts. 2. Into **complete** and **incomplete**. The incomplete is destined by nature to constitute with some other being a substantial unit; thus, the human soul needs the body to constitute man. The complete is not destined to such union, *e. g.*, an angel, a plant; it is therefore the complete principle of all its natural actions.

55. A complete substance is called a **supposit**; a supposit endowed with intellect is a **person**. As a human soul is not a complete substance, it is not a person. The Infinite Being, since it is complete and intelligent, is of course a personal being.

Since accidents exist in their substance, **actions**, which are accidents, belong to their supposit; the supposit it is which acts, *actiones sunt suppositorum;* the parts and powers of the supposit are not so properly said to act as to be the instruments by which the supposit acts. Thus we say 'A man walks,' not 'His feet walk'; 'I am thinking,' rather than 'My mind is thinking'; 'We see with our eyes, feel with our hands,' etc.

56. Since actions properly belong to the person, and the person who assumed human nature in the mystery of the **Redemption** is the Second Person of the Blessed Trinity, all the acts which He performed in His assumed human nature are really the acts of a Divine person, of God; they are Divine, and therefore of infinite merit. In becoming man He took upon Himself a complete individual human nature, *i. e.*, a soul and a body like ours, but not a human personality; He is not a human person, for person is the ultimate *substratum* of an intellectual nature. If, therefore, the ultimate *substratum* or person in Christ were human, then we could not say with truth what all Christians profess who recite the Apostles' Creed, viz., that the "only Son of God was born of the Virgin Mary, suffered, . . . was crucified; died, and was buried,"

etc., nor could St. John have written in his Gospel, "The Word was made flesh and dwelt amongst us."

57. **Personal identity** consists in the permanence of the intellectual supposit, not in the continuity of his consciousness; for even when we are totally unconscious we are still the same individual persons. Mankind has never believed that a man on losing consciousness ceases to be a person or becomes another person. On this point Locke, like many other philosophers, has written much that common sense does not support. He considers person to be merely a 'forensic term,' and personal identity to be nothing but consciousness. "It (person) is a forensic term appropriating actions and their merit. . . . This personality extends itself beyond the present existence to what is past only by consciousness, whereby it becomes concerned and accountable," etc. (*Human Underst.*, b. ii. c. 28, § 27). This doctrine would make us no longer accountable for acts which we have forgotten, of which we are no longer conscious.

Article II. The Intrinsic Accidents.

58. We have defined an **accident** as a being which cannot exist in or by itself, but needs a *substratum* or substance to exist in. By saying that accidents cannot exist by themselves we mean that they cannot do so as nature is now, or according to the actual physical laws. It is not, however, impossible for the Creator to maintain certain accidents in existence without a substance. God can do all that involves no contradiction; therefore He can keep in existence without inhesion in a substance such accidents as only imply a tendency, an exigency to inhere, and do not, in the very concept of them, imply the act of inhering, or actual inhesion in a subject. As a matter of fact, the Church teaches that

after the consecration of the bread and wine at Holy Mass the substances of the bread and wine cease to exist, and still their accidents of quantity, color, taste, etc., are preserved in existence by the supernatural action of the Divine will. In this doctrine there is nothing against reason. For the accidents have being or entity which is really distinct from the entity of the substance, since it may be changed while the substance remains the same. The substance supports that entity, but God can keep it in existence by His will directly without using the substance to produce that effect. For it is clear that whatever effects God can produce through second causes, *i. e.*, through His creatures, He can produce the same directly by His mere will whenever the effect is not of such a nature as to imply a created cause. Now, although the **accidents of bread and wine** naturally inhere in those substances, still human reason cannot see that quantity, color, taste, etc., essentially imply a substance to exist in. A full treatment of this question does not belong to a brief compendium of philosophy.

59. There are two classes of accidents which in their very concept involve inherence in something else, viz.: 1. **Vital acts**, such as those of will and intellect; and 2, **Modal accidents**, *i. e.*, accidents of accidents, *e. g.*, figure, which is a mode of quantity; for every quantity, by the very fact that it has limits, has necessarily some shape or figure, *i. e.*, some mode or manner of limitation. Those accidents which essentially imply only a tendency to inhere are often called **absolute accidents**, to distinguish them from modal accidents and vital acts. But, as explained above, the term 'absolute accident' is also used in contradistinction to the relative accident or relation.

60. The **intrinsic accidents** are three: *quantity*, *quality*, and *relation*.

I. **Quantity,** in its widest sense, is predicated of all that can be more or less. Thus taken, it is predicated:

1. Of *degrees of perfection*, as when we say that a man has a greater quantity of perfection than a plant. 2. Of *degrees of energy* or power, *e. g.*, a man has more intellect than a child. In a stricter sense, taken as one of the categories, quantity means the amount there is of a substance; it implies divisibility into parts of the same species as the whole, as of water into drops, not into gases. It is predicated: 1. Of *multitude*, which is called **discrete quantity,** because its parts are considered as separate from one another (*discretus*, viewed apart). 2. Of the *extension* of material substances, which is called **continuous quantity,** because its parts are considered as not separate (*continere*, to hold together), the end of one part being the beginning of another. The quantity of bodies has three dimensions: length, breadth, and depth; these, considered as existing in given bodies, are called **concrete quantities,** but when separately viewed, *i. e.*, only in their properties, as they are in mathematics, they are **abstract quantities.**

61. II. The term **quality** cannot be strictly defined, since it is a category, containing no genus and difference. It is that which denominates a substance as such or such and not otherwise; not as such a substance, say iron or gold, but such iron or such gold. Quality is often described as "any note that completes or perfects a substance in itself or in its action."

There are **four species** of qualities:

1. Those disposing the subject well or ill in itself or towards something else. Such qualities if transient are called dispositions, *e. g.*, well, ill, ready, unready, etc.; if permanent, they are called habits, *e. g.*, science, health, virtue, vice, etc.
2. Powers, *i. e.*, qualities which enable a subject to do

certain acts, whether such qualities belong to the very nature of the substance, *e. g.*, intellect, will, etc., which belong to every man; or are accidental to it, *e. g.*, talent to learn fast.

3. Sensible qualities, *i. e.*, those which affect the senses, *e. g.*, sweetness, sourness, warmth, cold, white, black, etc.
4. Figure, *i. e.*, qualities regarding the arrangement of material parts, *e. g.*, square, round, straight, etc.

A *passion*, when denoting a passing organic affection, such as anger, hunger, desire, etc., is not called a quality, but it is the accident or category called passion, for it means that a substance is acted upon; when denoting an abiding inclination to any affection, it is a quality of the first kind, *e. g.*, irascibility, gluttony, etc.

62. III. **Relation** is the accident denominating one thing as referred to another which it connotes, *e. g*, parent, greater, double, like, etc.; for there can be no parent unless there be a child, etc. Every relation supposes three things: (*a*) A *subject* which is related. (*b*) A *term* to which it is related. (*c*) A *foundation* of the relation; *e.g.*, when we say "virtue is more precious than gold," virtue is the subject of the relation, 'gold' is the term to which it is related, and 'precious' expresses the foundation of the relation, viz., price or value. A relation is *real*, *logical*, or *mixed:* (*a*) It is **real** when the foundation of the relation is in the things related, independently of our mind, *e. g.*, between cause and effect; if that foundation is found in each term, the relation is called *mutual.* (*b*) It is **logical** when its only foundation is in our mind, as when I say that the essence of God is the reason of His existence; for there is only a mental distinction, and therefore only a mental relation between His existence and His essence. (*c*) It is **mixed** when the relation is real in one of the things

related, and not real but only logical in the other; thus, a contingent being implies relation to the necessary being, but a necessary being can exist without a relation to a contingent being.

The **category of relation** is confined to the real relation; for all the categories express special manners in which things exist. It will be noticed that the mind cannot consider any relation without abstracting the foundation of that relation. Now, brutes have no power of abstracting, therefore they cannot apprehend relations, but only the things related.

Article III. The Extrinsic Accidents.

63. The **extrinsic accidents** are six: *action*, *passion*, *the where*, *the when*, *posture*, and *habiliment*. They are **extrinsic** because in each of them we advert primarily to something distinct from the subject spoken of; *e. g.*, an action is denominated according to its term or effect, as 'to eat,' 'to walk,' 'to read,' etc.

64. I. **Action** signifies that accident which denotes a thing as proceeding from something else; thus, 'to think' denotes thought as proceeding from a thinking principle.

65. II. **Passion** is the receiving of an action. Action and passion are the two terms of the same motion; as when one strikes and the other is struck, one loves and the other is loved, etc.

An action is said to be **immanent** (*in-manere*, to remain in) if its term remains within the same faculty whence it proceeds; thus, 'to feel,' 'to know,' 'to will,' etc., are immanent acts. If the term does not remain within the eliciting faculty, the action is **transient** (*transire*, to pass over); as 'to push,' 'to pull,' 'to cut,' etc. The term 'transient,' *i. e.*, 'passing over,' should not lead us to

imagine that a modification of the subject passes over to the object; but the subject by its action so affects the object as to make a new modification arise in it.

66. III. **The where** is the accident which determines material substances to a place. **A place** is the inner surface of the surrounding body considered as immovable; for bodies may move, but places remain. Thus, the place of a rock is the inner surface of the air or earth that surrounds it on all sides. Hence it is evident that the 'where' is an extrinsic accident. The distance between the surfaces of a body is called its intrinsic place. A body is naturally so related to place that each part of the body occupies a part of the place; this is meant by saying that a body is **circumscribed by the place.** A spirit, having no parts, cannot thus be circumscribed, but is whole and entire in the place and in every part of the place; it is said to be **limited to the place** to which its power is restricted. Spirits are not directly related to place by their own nature, but indirectly and accidentally, inasmuch as their power either is being exerted or may be exerted on certain bodies, and those bodies are in a place. Thus, a spirit is truly in a place; for where it is not, it cannot act; yet place does not belong to spirits in the same sense as to bodies.

67. **Thesis VI.** *Limitless vacant space is not a real being existing independently of our minds.*

Explanation. Space, as far as our observation goes, is not vacant, but filled with matter, at least with ether, *i. e.*, with some imponderable substance, the vibrations of which transmit light even from the most remote points of the universe. Probably there is no perfect void anywhere in the world But, outside of the material world, space is still imagined to extend; we also imagine that, before matter was created, there was a limitless vacant space. Now, we assert that this

vacant space is nothing really existing out of the mind; we merely conceive a possible capacity, the absence of bodily substances.

Proof. If it were a real being existing out of the mind, it would have real quantity, for it has parts outside of parts; its quantity would be finite, or infinite, or indefinite. But it cannot be *finite*, else there would be other space around it; nor *indefinite*, for whatever exists really exists definitely, since indefinite means actually finite but capable of increase; nor *infinite*, for it will be proved hereafter that an infinite quantity actually existing is absurd (No. 93). Hence it is nothing real.

68. **It may be asked:** 1. Cannot space be the immensity of God? We answer, by no means; for space has parts outside of parts, and God's immensity has not; for it is God Himself, who is perfectly simple.

2. What is beyond the universe? Vacant space, *i. e.*, nothing actual.

3. What existed before the creation? Nothing but God.

4. If all substances in a vessel were removed, would there be space in it? Yes, there would be vacant space; vacant inasmuch as it contains no substance, yet real space inasmuch as the sides of the vessel are really related to each other.

5. How, then, is space defined? All space is conceived in reference to extension and relation between extended things. **Real or actual space** is the relation of place between real bodies, *e. g.*, between the sides of a vessel; **possible or imaginary space** is the imagined relation of place between possible bodies; **mathematical space** is extension considered in the abstract; **vacant space** is possible or imaginary space coupled

with the negation of a substance being there. Other authors designate as *physical space* all that we mean by actual and possible space united, and they define it as capacity to contain extended substances.

69. **Objections:** 1. If there were no bodies, space would still have real quantity out of our mind; for it would be really extended, having the dimensions of length, breadth, and depth. *Answer.* It would be only abstract or logical quantity; for it would be imagined as the possible quantity of possible bodies, and thus have only logical entity.

2. If all bodies but one were annihilated, and that one were moving, owing to its inertia it would keep on moving. But it could not move unless real space actually existed. *Answer.* It is enough for motion that there be possible space; real space is a relation between real bodies, and it is clear that this is neither necessary nor actual when there is only one body.

3. But it would really move, and real motion requires real space. *Answer.* We grant it would really move; but motion may be taken in two meanings: (*a*) As extrinsic to the moving body, *i. e.*, as a change of places, and such there could not be, since place supposes a surrounding body. (*b*) As intrinsic to that body, as a mode of its being, opposed to rest, and such motion has nothing to do with the relation which constitutes real space.

70. IV. **The when** is the accident which regards succession in time. To understand succession we must understand duration, *i. e.*, permanence in being. Now, a being can be permanent in three ways: (*a*) If it remains perfectly immutable, its duration is called **eternity.** (*b*) If its

nature is devoid of changes, but its accidents are susceptible of them, as is the case with the Angels, its duration is called **aevum** by the Schoolmen, for which term we have no English equivalent. (*c*) If its very nature is subject to changes, as is the nature of bodies, its duration is said to be in time. Such durations succeeding each other can be counted, and their number or measure constitutes **time.** In this kind of duration alone the 'when' of the categories finds its place.

71. **Time,** therefore, is the measure of succession in changeable beings; it is ever flowing, as the 'now,' or present moment, is ever moving onward, separating the past and the future. The 'now' is the indivisible limit between them. From this explanation of time it is clear:

1. That there was no time before the creation, as there were no changeable beings.
2. That some unit is needed in order to measure time; the apparent motion of the sun around the earth is a unit accepted by all nations.
3. Since time implies a relation between the measure and the measured, brutes cannot apprehend time as such (see No. 62); they apprehend the phenomena only, which happen in time.
4. Since the successions measured are objective realities, time exists outside of the mind; and it is absurd to maintain with Kant that time is merely a subjective concept, by which the mind puts order into the objects of its knowledge.

72. V. **Posture** is the manner in which the parts of a body are disposed with regard to an adjacent body; *e. g.*, when a man is standing on, lying on, leaning against a material object. Posture may remain the same though every part of

the space occupied should change, as when a person travels in a sitting or standing posture.

73. VI. **Habiliment** is the accident by which one bodily substance is furnished with another, as its dress, protection, ornament, etc.

The last two categories, just explained, are of minor importance; but they are needed by the philosopher in order that there may be no manner of being which cannot find its place under one of the highest genera.

CHAPTER IV.

CAUSE AND EFFECT.

74. A **cause** is anything which influences the existence of another thing; the latter is called the **effect.**

A **principle** or **principiant** is that from which a being proceeds or originates in any way. It may proceed from it:

1. *Logically*, as the conclusion does from the premises in reasoning.
2. *Physically*, by deriving physical being from the principiant. It may do so in two ways: (*a*) The principiant may produce it, *e. g.*, a tree producing fruit. (*b*) The principiant may be one of its constituent elements, as a wheel is of a clock.

A principiant is always **prior** to that which proceeds from it, in one of two ways: (*a*) In *time*, by existing sooner. (*b*) By *nature* only, when one being produces or constitutes another without existing before it; thus, flame is a principiant of light, roundness of a circle. These two ways of procession and priority do not embrace the peculiar procession by *origin* only, viz.: when the principiant and what proceeds from it are one identical being. This priority does not exist except in the Blessed Trinity, God the Father being the principiant of God the Son, and these two Persons together the principiant of the Holy Ghost.

75. **It will be readily inferred** from these definitions:

1. That the terms cause and effect always denote two distinct beings, while the term principiant may denote the same being with that which proceeds from it.

2. That procession does not necessarily denote succession in time.
3. That mere succession in time does not constitute procession; thus, the night succeeds the evening, but does not proceed from it.
4. That therefore the terms principiant and beginning are not synonymous; the principiant has an intrinsic and necessary connection with whatever proceeds from it, while the beginning may have only an extrinsic and accidental connection with what follows it.

76. When a cause is viewed as producing the effect, it is taken **formally** as a cause; else it is **materially** a cause. Thus, Columbus was from his boyhood the discoverer of the new world materially, not formally. This distinction between being materially and formally a cause should not be confounded with the other distinction which is next to be explained.

77. There are **five kinds of causes**: the *material* cause, the *formal*, the *final*, the *exemplary*, and the *efficient*.

1. The **material cause** is the matter out of which a thing is made; thus, steel is the material cause of a watch-spring; the distinction between matter and form will be explained further on (No. 127). Speaking analogically, philosophers often apply the name of matter, or material cause, to anything out of which another is produced; thus, they call the faculty of the will the matter, and an act of the will a form.
2. The form, or **formal cause**, is that which specifies the matter, *i. e.*, which makes the matter be of one species rather than another. The form is: (*a*) *Substantial*, if it goes to make the very nature of the substance and cannot be removed without changing that nature; *e. g.*, the vital principle in all plants and animals; for when

it ceases to be or departs, the substance or nature of the plant or animal is no more. (*b*) *Accidental*, if it can be destroyed without affecting the nature of the substance; *e. g.*, the shape of a hat.

3. The **final cause** is the end or purpose intended in an action; *e. g.*, when a man exerts himself to acquire riches, the acquisition of riches is a true cause of his exertion. The object itself aimed at, *i. e.*, riches, is the final cause materially considered; the acquisition of riches is the final cause formally considered.

78. **Thesis VII.** *All action is directed to some end or purpose.*

Proof. Every action is either done with intelligence or not; if done intelligently, the agent has some motive for his action; he is aiming at some result or other; he acts for an end. If an action is not done with intelligence in the agent, then it proceeds from an impulse of nature; it is then the effect of a physical cause. But physical causes act according to the laws by which the Creator governs the universe—*i. e.*, by which a wise God directs all things to proper ends. Therefore all action is directed to some end.

79. **Objections:** 1. A man often acts without a purpose. *Answer.* He then acts upon an impulse of his nature, and all such action is directed to some end by the Author of nature.

2. If he acted upon a natural impulse his action would be good, since it would come from God; but such actions are often evil. *Answer.* As far as his impulses are physical or purely natural they are not evil; but as far as he freely neglects to control his natural impulses according to the law of reason, they are evil.

3. Many actions are merely accidental. *Answer.* Every act proceeds from a cause, necessarily or freely, and therefore no action can be accidental; but an action

may have effects not intended by the agent, and these may be said to be accidental with regard to him, though they, too, have a definite cause, which acts for a definite end.

80. IV. The **exemplary cause** is the model conceived by an intelligent agent to the likeness of which he directs the effect of his work. It may be some pattern extrinsic to the agent which he wishes to imitate; thus, an artist sketches a real scene. Or it may be an original image intrinsic to the agent's mind, such as the plan conceived by a painter of the ideal scene which he wishes to represent.

81. V. The **efficient cause** is the agent that does the action. Every agent acts by its powers or faculties. The power itself is called, in the terminology of the Schoolmen, the *actus primus*, or potential act; the exercise of the power is the *actus secundus*, or elicited act. The potentiality itself is *remote*, or *proximate; e. g.*, an infant, from the very fact that it is a human being, has the power of reasoning, but remotely, *i. e.*, not in a condition fit for use; a grown person has the same power proximately, *i. e.*, fit for use.

82. The requisites for the exercise of a power are called **conditions**; these are not properly causes, since they do not bring about an action, but only remove what might prevent action. For instance, citizenship is usually a condition required for voting, but it does not as such induce one to vote.

A circumstance which is apt to induce an agent to act, though he might also act without it, is called an **occasion**; thus, a time of political excitement is an occasion apt to induce many to vote. If occasions influence actions they are real causes.

83. Several **further distinctions** apply to the efficient cause:

1. If it depends on no other cause, it is called the **first cause**; such is God alone; all others are **second causes**.

2. It is **properly** (*per se*) the cause of the effect intended and of such other effects as are natural consequences of the action done; thus, the surgeon is properly the cause of the pain he inflicts and of the cure he works. It is **accidentally** the cause of effects which were neither intended nor naturally to be expected, as when the surgeon causes death.
3. A **principal** cause is that to which the effect is chiefly attributable; an **instrumental** cause is that used by a principal cause; as when a lancet is used by a surgeon to open a sore with. The instrumental cause is always made to extend, by him who uses it, to some effect beyond its own competency; *e. g.*, the lancet could not cut *skillfully* without the skill of the surgeon.
4. A **free** cause can determine its own actions, a **necessary** cause cannot do so.
5. A **moral** cause is one to which an effect is justly imputed, because it induces another agent to act; it does so by command, advice, threats, provocation, etc., as when a naughty boy provokes a man to anger.

84. Since a cause is that which produces an effect, it is evident that it must in some manner contain the effect; for as the axiom expresses it, *Nemo dat quod non habet*—"No one gives what he has not." Now, **a cause may contain an effect,** or rather the perfection which it communicates to the effect, in three ways:

1. *Formally*, when the cause and effect are of the same species; thus, a plant produces a plant, clouds bring rain, etc.
2. *Eminently*, when the cause is specifically superior to the effect and contains the perfection of the effect in a higher manner of existence; thus, God contains all the perfection of creatures.

3. *Virtually* or *equivalently*, when the cause possesses a superior perfection which can produce the effect; thus, an artist may produce a painting much fairer than himself; he does not possess its beauty eminently, but he possesses an intellect which can conceive and a skillful hand which can express ideal beauty.

When a cause contains an effect formally, it is called a **univocal cause**; else it is an **equivocal** cause.

Since an effect is contained in its cause, it is evident that **no effect can be more perfect than its cause.**

85. We must notice two important **limits to causality:**

1. A finite cause can only modify an existing subject, but not produce a substance from nothing.
2. No cause can **act at a distance**, *i. e.*, where it is in no way present; for where it is not, there it is nothing, and nothing can do nothing. Still it suffices that the cause be mediately present to its effect, as when the sun, by the vibrations of ether, gives light and heat to the earth.

Sceptics have denied the **reality of causes and effects**; but it is evident: (*a*) That all men distinguish the relation of cause and effect from that of mere succession in time. (*b*) That all men judge causes and effects to be realities, on which all legislation, all commercial and professional pursuits, as well as all trades, are based. (*c*) That all languages proclaim this reality, *e. g.*, in the use of such verbs as 'to make,' 'to produce,' 'to push,' 'to pull,' etc., and of such particles as 'why,' 'because,' 'therefore,' etc. (*d*) That we are conscious of exercising effects, *e. g.*, of raising our hands at will, of speaking, walking, etc.

86. The study of principiants and causes obviously suggests two important principles of certain knowledge, viz.: (*a*) **The principle of the sufficient reason,** expressed thus: "There is

nothing without a sufficient reason for it." (*b*) **The principle of causality**, expressed thus: "Nothing is made or begins to exist but by a cause."

87. **Thesis VIII.** *The principle of the sufficient reason and that of causality are absolutely certain.*

Proof. 1. The principle of the sufficient reason is an analytical judgment so obviously evident that we cannot rationally deny or even doubt it without thereby implicitly affirming it; for rationally to deny or doubt it we should see some reason for so doing; and thus we admit the validity of the principle, denying it because we see a reason for so doing.

2. *The principle of causality* flows from the preceding; for when anything begins to exist, there must be a sufficient reason for this beginning. That reason must be either in the object itself that begins to exist or in something else. It cannot be in the object itself; neither in the acts of that object, for it cannot act before it exists; nor in its nature, for then the object would be necessary, but a necessary being is so from eternity and has no beginning. Therefore, the reason of its beginning to exist must be in another being; but this means that it has a cause.

88. **Objection:** All our knowledge comes through our senses; now, causality does not come to us through our senses; we see facts only as succeeding one another, not as causing one another. *Answer.* This objection refutes itself; we know what causality means, yet, it says, this knowledge is not conveyed to us by sensation; therefore, it follows we do not get all our knowledge by sense only. It is, however, correct to say that all our knowledge begins in sensation. The relation of cause and effect is not perceived by sense, but by the intellect on occasion of sense-perception (see Nos. 178, etc.);

e. g., I understand that my sensations are caused by myself as the eliciting subject, and by the bodies perceived as the determining object of my perceptions.

89. **Corollaries.** From all these explanations it is evident: 1. That nothing can be its own cause. 2. That two things cannot cause each other. 3. That the principle of causality is not acquired by induction, but is *a priori*, and only verified by experience. Children show that they have begun to reason when they ask, "Why is this?" (what is the sufficient reason?) "Who made this?" (what is its cause?), etc.

CHAPTER V.

THE CHIEF PERFECTIONS OF BEING.

90. The **chief perfections of being** are *simplicity*, *infinity*, *necessity*, and *immutability*.

I. **Simplicity** is that perfection which makes a being identical with everything that constitutes it; it is a positive perfection, but it is conceived by us in a negative way, viz.: by the exclusion of all composition. A being is *absolutely simple* if it excludes all manner of composition.

91. **Composition** implies a want of identity among the parts of a whole or unit. The whole and its divisions are called **actual**, if there is outside of the mind a true junction or combination of parts. If the parts can exist separately, *e.g.*, 'soul' and 'body,' the actual unit is called **physical**: if they cannot, it is **metaphysical.** Thus man's 'animality' and 'rationality' are metaphysical parts of a metaphysical whole, for they cannot exist separately; take away from a man the principle of his rationality, the soul, and you have left, not an animal, but a dead body. It will be noticed the metaphysical division regards the *comprehension of an idea.* The whole and the division are called **potential** when the parts are not united outside the mind, but are capable of being classed together as realizing the same idea. For instance, 'animal' expresses a potential whole if we consider its extension—*i. e.*, the class of individuals to which it is applicable. This is often called the *whole of extension*, and also a *logical whole*, because the union of the individuals is not in nature but

in the mind only, which apprehends them all by their common nature, and forms of them a mental unit. The latter division is the one which logic properly deals with; for it breaks up larger classes into smaller, and these into smaller again.

92. II. The **Infinite** is the perfection which contains all entity so that none be wanting; it is a most positive perfection, though conceived in a negative way, viz.: by denying all limitation. But, since limitation is itself a negation of further perfection, the absence of limitation in a being, *i. e.*, its infinity, is a negation of a negation, and therefore an affirmation.

The **Potential Infinite** is the finite conceived as capable of constant increase; it is, therefore, not truly infinite but indefinite, though in mathematics it is usually called infinite. The infinite cannot be measured or counted; because measure and number express a limit, and the infinite has no limit. It is also to be observed that no amount of finite additions can ever make the finite become infinite.

93. **Thesis IX.** *No existing quantity can be infinite.*

Proof. Since the essence of quantity implies divisibility, any existing quantity may be divided, at least mentally. Let us, then, cut off a small portion from the quantity which was supposed to be infinite; what remains will be finite; and that finite remainder increased by the small portion cut off will be infinite. But this is absurd, viz., that a finite quantity should differ from the infinite by a small portion. Besides, suppose we add to the finite remainder a portion greater than that cut off; we should then have a quantity greater than infinite, which is impossible. An infinite body would measure an infinite number of yards, and more than an infinite number of feet.

94. **Objections:** 1. The multitude of possibles is infinite;

for there is no limit to the things that God can create. *Answer.* The possibles are not existing; the thesis regards existing quantity.

2. The acts of creatures will go on increasing in multitude for ever. *Answer.* The number of past acts will always be actually finite, though capable of constant increase—*i. e.*, the multitude of future acts is indefinite.
3. It cannot be indefinite; for God knows all future acts of His creatures distinctly, and therefore definitely. *Answer.* God's knowledge is conformable to the reality—*i. e.*, to the object of that knowledge; now, that object is a series of acts, all distinct from one another, ever continuing, but never being an existing infinite series. Besides, distinctness of knowledge is opposed to vagueness of knowledge, and need not imply limitation of the things known.
4. Any extended body contains an infinite multitude of parts. *Answer.* The number of ultimate particles into which a body can physically be divided is finite; but the extension of the body can be mathematically divided without end—*i. e.*, it is potentially, not really, infinite in its divisibility.

95. It may be asked **how we acquire the idea of the infinite.** We do so, not by intuition of the Infinite Being, or God, nor by mentally adding perfections to perfections, for finite things added together can never give the infinite; but seeing finite things we distinguish in them, by abstraction, perfection and limitation; next, by denying limitation we form the abstract concept of unlimited perfection, *i. e.*, of the Infinite Being. The idea thus formed is of a positive object; objectively considered, it is not negative, but most positive; but subjectively considered, it implies affirmation and negation. The idea of the finite, on the other hand, is not a mere

negation; for it is the affirmation of something and no more —*i. e.*, it affirms one thing and denies anything beyond.

96. III. **A necessary being** is one whose non-existence is impossible. It is *hypothetically* necessary, if its non-existence is impossible under a certain hypothesis or supposition; it is *absolutely* necessary, if its non-existence is impossible under any supposition. Now, this cannot be the case unless its very nature implies existence, unless the being be self-existent. If such a being exists it must have always existed, and cannot cease to exist, else its non-existence would not be absolutely impossible; it is therefore eternal—*i. e.*, without beginning and without end.

97. Any being which is not absolutely necessary is said to be **contingent**—*i. e.*, it may be or not be, it is not self-existing. If it exists and yet has not in itself the reason of its existence, it must then have that reason in another being; but to have the reason of one's existence in another is to have a cause; therefore every contingent being, if it exists, must have a cause.

98. IV. **Immutability** is the necessity of remaining the self-same, the impossibility of changing. A **change** is a transition from one state of being to another. It implies three things: (*a*) A former state which is abandoned. (*b*) A latter state which is assumed. (*c*) A subject that abandons the one state and assumes the other.

99. **The change may occur variously**: 1. A substance may be changed from one species to another by losing an old and acquiring a new substantial form, as when metals are oxidized. 2. The subject may acquire or lose some substance without change of its species, as when a sand-bank grows larger or smaller. 3. It may acquire or lose a quality, as when iron gets hot or cold. 4. It may pass from local motion to rest, or from rest to local motion. 5. It may assume a new arrangement of parts, as when water freezes. 6. Supernatu-

rally, one substance may be substituted for another while the accidents remain, as when the bread and wine are changed into the body and blood of Christ. But in this case the word change is taken analogically for *transubstantiation.* A change of relation between one being and another is called an **extrinsic change.** This may occur though one of the two beings remains absolutely immutable, as when God became a Creator without undergoing any intrinsic change, simply because the creatures began to exist, and thus a new relation was established toward God which had not existed before.

BOOK II.

COSMOLOGY.

100. **Cosmology** is the first part of *Special Metaphysics* (No. 4); it is the study of the visible world in connection with its highest causes. We mean by the **world,** or the **universe,** the total collection of all material objects knowable by mankind.

In studying the visible world, we are to consider: 1. Its origin. 2. Its purpose and its perfection. 3. The laws that govern it. 4. The constituent elements of matter. 5. The general properties of bodies.

CHAPTER I.

THE ORIGIN OF THE WORLD.

101. The origin of the world is obviously one of the most important questions discussed in Philosophy. The ancients were divided among **various opinions** on the subject. 1. Plato maintained that the matter which composes the world was necessary, and therefore eternal, but that it was properly arranged by an intelligent Being, who is God. 2. Aristotle supposed that both the matter and the order of the

universe were necessary and independent of any cause. 3. Pythagoras held the theory, revived in the Middle Ages by the eccentric Scotus Erigena, that the world has come forth from the Divine Substance by an outward emanation, an outpouring or outputting of the Divinity. 4. Another explanation, not unknown to the ancients, was scientifically developed in the seventeenth century by the Jewish philosopher Spinoza, who taught that there exists only one substance, necessary, self-existent and infinite, endowed with the two attributes of extension and thought. These attributes he supposed to be necessarily in constant action; the evolutions of its extension producing the various bodies of the world, and the different series of its thoughts being the minds of men; thus, the whole universe would be nothing but a succession of constantly varying phases assumed by the infinite substance. This system has been called an internal emanation of the Infinite Being; it is really Pantheism (*πᾶν Θεός*, everything God), for it makes all things mere modifications of the Divine nature.

102. **Idealism** is a modern system of Philosophy, taught chiefly by Fichte, which, instead of explaining the origin of the material universe, prefers to deny the existence of all bodies, and to maintain that there exists nothing but the *Ego*, whose ever-changing phantasms, like a sick man's dreams, are mistaken for objective realities. This vagary is refuted in Critical Logic, because it denies the reliability of sense-perceptions. The true doctrine, conformable alike to reason and to Revelation, is that "In the beginning God created heaven and earth" (Gen. i. 1).

103. **Pantheism**, if not expressly taught, is at least implied in the speculations of many modern infidels; the Agnostic school inculcates the same error in a milder form, teaching that, for all we know, the visible world may be the

sum total of actual being, the existence of a God distinct from this world being classed among unknowables.

Thesis I. *Pantheism and Agnosticism are systems destructive of all religion, of morality, and of human society.*

Proof. If Pantheism or Agnosticism were true, each of us would be, or at least might be, for all we know, a part of the infinite substance; in fact, the worst men in the world would or might be self-existent, and therefore independent of a Maker and Supreme Master, a part of God, as Divine and necessary as God Himself. If so, no one could or should worship a Superior Being, hence no religion; no one need obey a higher law-giver that would bind his conscience, hence no morality; without morality no restraint on man's selfishness, a mere struggle of might, whence would soon result a state of mere barbarism, the destruction of society.

104. **Thesis II.** *Neither the world nor the matter of which it is composed can possibly be self-existent.*

Proof 1. A self-existent being is immutable; for, if it must necessarily exist, it must also necessarily be such as it is; else why is it such as it is? If it was necessarily a certain thing, no other being could make it anything else. In other words, whatever gives an object existence gives it a definite existence; for it could not give it an indefinite existence. Now, the world and the matter of which it consists are not immutable, but subject to constant changes, as is evident to our senses. Therefore they are not self-existent.

Proof 2. The world and all matter are finite, for all matter is divisible, and as such has quantity; but whatever has quantity cannot be infinite, as was proved in *Ontology* (No. 93). Therefore both matter and a world consisting of matter are finite. Now, a self-existent being cannot be finite, it cannot have limits, for those limits would be self-imposed, but no being can impose limits on its own nature: (*a*) Not

freely, for a being must first exist in a definite nature before it can act freely. (*b*) Not *necessarily*, for this would mean that the perfections of that being exclude all further perfections; but no perfection can be exclusive of any further perfection, since all perfection is positive, and there can be no contradiction except between a negative and a positive. Hence a self-existent being has no limits; it is infinite, and therefore neither the world nor its matter is self-existent.

Proof 3. (*A*) The world is not self-existent, for whatever is such must have existed from eternity, without a beginning, since nothing can begin to exist without a cause (No. 87). But the world cannot have existed without a beginning (see Thesis IV., No. 109). (*B*) Matter is not self-existent.

Who would persuade himself that every particle of dust is a necessary being, having the reason of its existence in its own nature? Every particle of matter bears, as it were, the trade-mark of a manufactured article. The proof may be thus proposed:

If the elements of matter were self-existent, they would constitute a finite or an infinite multitude, but they could do neither. *We prove the major:* (*a*) They would constitute a multitude, for any definite collection of units constitutes a multitude. Now, the elements of matter would be a collection of units, for each of them is a unit. (*b*) This multitude would be finite or infinite, for nothing can exist indefinitely; when, for instance, we speak of an indefinite quantity, we mean a quantity actually finite, but capable of further increase—finite as far as it exists. Hence the elements would constitute a multitude, and that multitude would be finite or infinite.

We prove the minor: The elements of matter cannot constitute a finite nor an infinite multitude: 1. Not an infinite multitude, for no existing quantity can be infinite, as proved

before (No. 93). 2. Nor can it be a finite multitude; for if a million particles, say of gold, existed necessarily, then it would be either by accident or for some sufficient reason that there should be just a million, and not one more or less; but it can be neither: (*a*) Not by accident, for accident means a result without a reason for it, and there is nothing without a reason for it, therefore the number of particles cannot be determined by accident. (*b*) Nor can there be a sufficient reason in the particles why they are just one million in number, since the fact that a million exist cannot be a reason why there could not be one more, for there is no more contradiction in a million and one than in a million particles.

105. **Objections:** 1. Matter is indestructible, therefore it is necessary. *Answer.* It is not indestructible by the power of God.

2. The substance of matter might be immutable, though its accidents are known to be changeable. *Answer.* (*A*) Not only its accidents, but its very substance is changeable, *e.g.*, when a plant dies, when iron rusts, etc. (*B*) If matter being unchangeable, its accidents were changeable, they would have been changing from eternity, since necessary matter would have existed from eternity; and thus there would either (*a*) have been, by this time, an infinite quantity of changes; but an infinite series can never be gone through, and so the most recent change could never have been arrived at; (*b*) or if the number of changes were finite, then the matter must at first have been changeless; and if so, the first change could never have begun, for it was not necessary, and nothing begins by accident, *i. e.*, without a cause, and thus matter motionless from eternity could never have begun to move.

3. Though the elements be singly unnecessary, the whole

collection of them may be necessary. *Answer.* By no means; a collection of unnecessary things is not and cannot be an absolutely necessary collection, for a collection is nothing else than the sum total of the things collected.

4. The world is infinite, for it fills all space, and space is infinite. *Answer.* It does not fill all possible space, but only all actual or real space, and this is finite (No. 68).

106. **Thesis III.** *Matter could not have originated but by creation.*

Explanation. By creation we understand the making of a substance out of nothing. Now, we maintain that, though some species of matter may arise from other species of matter, *e. g.*, water from the chemical combination of oxygen and hydrogen, still ultimately the first matter in existence must have been made out of nothing, *i. e.*, by creation.

Proof. To be created is to be made out of nothing; but matter was made out of nothing; hence it was created. *We prove the minor:* 1. '*It was made*,' *i. e.*, it received its existence from another being, for there is nothing without a sufficient reason. This reason must be either in the being itself or in another being. Now, the sufficient reason of matter is not in matter itself, else matter would be self-existent, and we have just proved that it is not so. Therefore the reason of its existence must be in another being, *i. e.*, it is made. 2. '*Out of nothing*,' for if it were made out of something pre-existing, that something would be mutable, else nothing new could have been made out of it; but what is mutable is not self-existent (No. 103); hence it, too, must have been made, either out of something else or out of nothing. If out of nothing, then our proposition is proved; if out of something else, the same difficulty will always return, until we arrive at

some matter that was not made out of anything else. The only way to evade this argument is to suppose an infinite series of transformations that matter has undergone; but an infinite series could never have been passed through; besides, it would be infinite and still not infinite, but increasing; therefore there was, or is, a first matter made out of nothing.

107. **Objections:** 1. Scientists object that it is unscientific to trace natural effects to a supernatural cause. *Answer.* Scientists do say so, but the only scientific way is to trace effects to their true causes by whatever name you call these. Now, the only true, the only possible cause of matter is creation, as we have proved.

2. But creation is impossible, for out of nothing nothing can be made. *Answer.* It is true that nothingness cannot become a material out of which things are made. But that is not the meaning of creation; it means simply that God, by His Almighty will, without using any material, has made that to exist which would not exist, either in its present state, or in its elements, or in any way whatever, but for the mere fact that He wills it to exist.

3. But the cause must contain the effect, and God did not contain matter. *Answer.* God contained all perfection of matter without its imperfections—*i. e.*, He contains matter *eminently*. For instance, matter is something that can exercise certain powers. God can exercise all those powers—*i. e.*, He can produce all those effects; and thus there is nothing in matter that does not find its prototype in God. He also contains matter *virtually*—*i. e.*, He can produce it, for He is Almighty.

4. The very idea of matter contains extension, but there

is no extension in God. *Answer.* It contains extension in the object of the idea, not in the subjective idea. As to the minor, extension is not formally in God, but eminently—*i. e.*, as far as it implies no imperfections.

108. **A further question** is often discussed with regard to the origin of the world, viz.: Is it certain that its creation could not absolutely have been from eternity, that the world must have had a beginning, that matter itself must have had a beginning? Though it would seem that the very essence of creation implies a transition from non-existence to existence, and therefore a beginning of the creature, still St. Thomas, and many of the most distinguished philosophers, say that a creation from eternity cannot be conclusively proved to be absurd, because it is not so: (*a*) On the part of the Creator, Who was from eternity Almighty. (*b*) Nor on the part of the creature, which was from eternity capable of being created. (*c*) Nor on account of the necessary subordination of creature to Creator, for that, too, would be secured. But though creation, as such, may perhaps be possible without a beginning, there is something special in the nature of the world which shows that it cannot have existed from eternity.

109. **Thesis IV.** *The world cannot have existed from eternity.*

Proof. The world contains a series of changes. If it had existed from eternity, there would have been an infinite series of changes before any particular change could have taken place, *e. g.*, before vegetation began; but an infinite series can never be passed, nor can anything infinite be further extended. Therefore the world cannot have existed from eternity.

110. **Objections:** 1. St. Thomas and many others admit the possibility of creation from eternity. *Answer.* St. Thomas admits that the proofs of this proposition are

not absolutely conclusive; many other great minds think they are conclusive, and they are certainly very powerful, far more so than any objection brought against them. St. Thomas did not wish to rest our belief in creation on a mere reasoning about which logicians might quibble, because it rests on the firmer basis of Divine Revelation. (*Summa*, i. q. 46, art. ii.)

2. The world might have been changeless at first. *Answer.* A material creation absolutely at rest would be useless.

3. The creative act was from eternity, therefore its effect also. *Answer.* It was eternal subjectively, *i. e.*, in God; not objectively, *i. e.*, on the part of the creature.

4. When the cause exists the effect must exist. *Answer.* If the cause acts necessarily, yes; not if it acts freely and by one single act which extends from eternity to eternity (see Nos. 243, 244).

5. But God is a necessary cause. *Answer.* He is a necessary being, but a free cause.

6. The act of creation would have produced a change in God. *Answer.* Yes, if it were not subjectively eternal.

7. From not being a Creator He would have become a Creator. *Answer.* The change was extrinsic to Him and intrinsic to the world, leaving Him as He was.

8. God always does what is best, but to create from eternity is best. *Answer.* God can never do for a creature what is absolutely best, for He could always do better still; the finite cannot exhaust the infinite fund of power and goodness.

9. Motion cannot have had a beginning, for every motion must come from a preceding motion. *Answer.*

Philosophers often call any *act* motion, and it is true that there must have been activity of some kind without a beginning. But the first activity is not in material things; it is in God, Who is all activity from eternity, not by a succession of acts, but He is one infinite act, or, as it is technically called, a pure act, *actus purus.*

111. As to the question **how long the world has really existed,** we are left in considerable darkness. The extrinsic argument of authority is that of the **Mosaic Revelation.** It gives the ages at which the patriarchs begot their oldest sons; whence we calculate that mankind did not exist on earth more than 6,000 years before the birth of Christ. But how long did the material universe exist before the creation of man? The inspired account of Moses, evidently not intended to teach us chronology, is capable of various interpretations, and has been, from remote periods of the Christian era, variously understood by the learned. Some suppose that an unknown period of time, which may have been of any length, elapsed before the first day began; and this appears to be the obvious meaning of the second verse of Genesis. Some interpret the six days as six periods of unknown duration. Others prefer to understand the Mosaic account in the most literal and most restricted sense; these must suppose that the Lord created the earth with many marks of old age upon it. This is indeed possible, but there is no proof of it.

It is the part of Philosophy to trace effects to appropriate causes, and therefore physical effects to physical causes, whenever it can do so without contradicting any certain teaching of Revelation. By *a priori* reasoning we cannot prove either the recent or the remote period of the creation. Reasoning *a posteriori*, Geology, though still most imperfect as a science, makes it appear probable that the earth

had been in existence for a long period of time before the creation of man. [See both the theological and the scientific arguments treated with much learning and logical accuracy in *Geology and Revelation*, by Rev. Gerald Molloy (Part II.); also, Cardinal Mazzella's *De Deo Creante* (Disp. III., art. iv.) and Schanz's *Christian Apology* (vol. i. c. xv.)]

CHAPTER II.

THE END OR PURPOSE AND THE PERFECTION OF THE WORLD.

112. To understand the end or purpose for which anything has been made, we must distinguish between the **purpose of a work** and the **purpose of the workman** who produced the work. For instance, the purpose of a watch is to show the time, the purpose of the watch-maker may be to earn money. We must, therefore, consider two questions with regard to the world: 1. What purpose did God intend in His own creative act? 2. What purpose is the world to accomplish?

113. **What purpose did God intend in His creative act?** He cannot be said to have acted without any purpose; for it is the part of wisdom to act for an end and even for a worthy end. Now, God alone is worthy of Himself: therefore He created for Himself.

Had God, then, anything to gain by creating? He had, of course, to exercise His free will; but He could do this equally well by choosing to create or by choosing not to create. Why did He prefer to create? He had nothing to gain for Himself; for He possessed all perfection. But He could benefit others by creating, and thus exercise His goodness or bounty. It was not necessary for Him to do good to others; yet it was worthy of Him. In this double sense, therefore, God created for Himself, viz.: to exercise His liberty and His bounty. This purpose of God cannot, how-

ever, be called the **final cause** of His action; for a cause produces an effect which is really distinct from itself, while in God there is no real distinction of any kind; His bounty is His will, not the cause of His will; yet it may be called the *reason* or *motive* of His choice. Inasmuch as God wished to exercise His bounty, He created in order to bestow happiness on His creatures; but He intends this end as worthy of Himself, and thus the happiness of the creatures is subordinate to the exercise of His bounty, which is truly God's ultimate purpose.

114. **What is the purpose of the work?** Or what purpose is the world meant to accomplish? Since it was created to exercise God's bounty, the world is certainly intended to make creatures happy, especially the chief creatures, *i. e.*, rational creatures. But this is not its ultimate purpose. For to know the ultimate end for which anything is intended by a wise maker, we have only to consider the highest good which it is capable of accomplishing, and not some inferior good which it may also attain. Thus, a watch may indeed be used as a mere toy or an ornament of dress; but it is fit for something better, viz.: to indicate the time, and this is its primary end. Now, the world is capable of doing more than making creatures happy; it can *glorify the Creator;* and this is, therefore, its ultimate or primary purpose.

115. **Glory** is the recognition of exalted excellence. God recognizes all excellence in Himself, and this recognition constitutes God's *intrinsic glory*. The world manifests to intelligent creatures the goodness, power, wisdom, etc., of the Creator; their recognition of God's perfection constitutes His *extrinsic glory*. It is the highest purpose that this world can answer; it is therefore the primary purpose for which the world exists, the happiness of men being subordinate to

it, as an inferior end must ever be subordinate to a superior end.

While the happiness of men is truly and proximately intended by the Creator, it is fitting that the happiness of intelligent creatures should be made to depend on their own free choice. Therefore men are left free to work out their own happiness; and, as a natural consequence, they are free to fail in that choice by preferring something else; thus moral evil is possible, though not intended by the Creator. But it is not fit that the work of an all-wise God should fail to attain the primary purpose that it was created to accomplish, which is the extrinsic glory of God. Therefore free creatures cannot deprive God of His extrinsic glory. Man can only choose his own manner of glorifying God; either he can reach happiness, and thus *glorify His bounty*, as God invites him to do; or he may spurn this invitation and command of his Master, and, by incurring deserved punishment, *glorify the justice* of the Creator.

116. Hence it is evident that God's will to punish a guilty creature is consequent on the free acts of that creature; it is therefore called God's **consequent will**; but His will to make all men happy is antecedent to their free choice, and is called His **antecedent will.** Hence it is also clear that the doctrine which maintains that God predestines some men to eternal loss is as directly opposed to Philosophy as it is to Revelation.

117. **Thesis V.** *The world is not absolutely but relatively perfect.*

Proof. 1*st Part. Not absolutely perfect.* A thing is absolutely perfect if it attains perfectly the best possible end; but the end which the world attains is not the best possible; for it manifests God's perfections in a finite degree, and its end would be better if it manifested those perfections in a higher degree. Therefore it is not absolutely perfect.

2d Part. Relatively perfect. A thing is relatively perfect if it attains perfectly the exact end for which it is intended; but God must make the world do so; for a wise being makes his works as suitable to their ends as he can, and God, Who is infinitely wise and powerful, must therefore make all His works attain exactly the end for which He intended them.

118. **Objections:** 1. The work of the absolutely perfect Being must be absolutely perfect. *Answer.* No creature can be such that an infinite Creator could not produce a better one.

2. At least an infinitely wise and good God could have produced a much better world than this; therefore this world is not relatively perfect. *Answer.* He could have made one suited to procure a much higher manifestation of His perfections, but not one better suited than this to procure just such an amount of that manifestation as He wishes; relatively to this end the world is perfect.

3. The end of the world is the happiness of men. *Answer.* The happiness of men is their own intrinsic end—*i. e.*, their end as far as their own tendencies are concerned; but it is not their extrinsic end, which is the glory of God.

4. To be relatively perfect the world should manifest the goodness of God; but a world in which most creatures are ultimately unhappy does not manifest His goodness. *Answer.* If this reasoning were correct, it would only follow that most of God's free creatures will ultimately be happy, which we do not deny, because reason and Revelation leave us in ignorance on this matter; for all we know, men may be a small portion of free creatures. Still, it is clear

that the reasoning of the objection is not conclusive, for the minor proposition is not capable of proof.

5. God does not attain the extrinsic glory intended; for many men, instead of honoring, dishonor Him. *Answer.* God will draw good out of evil; the creature will either repent and glorify His mercy, or be punished and glorify His justice for ever. St. Thomas writes: "The defect of doing is made up by suffering, inasmuch as they (the wicked) suffer what the eternal law prescribes for them to the extent to which they fail to do what accords with the eternal law" (1^a, $2æ$, q. 93, art. vi.). And St. Anselm: "God cannot possibly lose His honor; for either the sinner spontaneously pays what he owes, or God exacts it of him against his will. Thus, if a man chooses to fly from under the will of God commanding, he falls under the same will punishing" (*Cur Deus Homo*, Nos. 14, 15).

CHAPTER III.

THE LAWS THAT GOVERN THE WORLD.

119. It is evident *a priori* that a wise Creator cannot produce a world that should be perpetually a mass of wild disorder; and we know *a posteriori* that the world displays the most wonderful unity amid variety, both in the structure and in the operations of its parts. In particular, we observe that all material things have well-defined and constant modes of action, which we call **the physical or natural laws.** The word *law* is here used analogically; it strictly means a rule of action for moral beings.

120. Now, some important questions on this subject present themselves to the philosopher:

1. What is the **nature of those laws?** or whence are those constant and uniform modes of action? There is no effect without a cause; what, then, are the causes of the physical laws? Since all things act according to their natures, the obvious answer is that the natures of things are the causes of their modes of action; and the Author of all nature is the Author of those laws. The physical laws themselves are the uniform modes of action of created natures or essences.

121. 2. Are the modes of action so necessarily constant that **departures from them** are impossible? It is evident that nothing can act except in conformity with its nature, and therefore departures from the physical laws are *physically* impossible, *i. e.*, no created power can produce them; but they are not *absolutely* impossible, for nothing created exists except as

dependent on the power and will of the Creator, and therefore the Author of nature can affect the action of created things, suspending and otherwise controlling it for wise purposes of His own. He may either suspend the action of a physical law, or make a creature for the time being follow other modes of action; for He can change the very natures of created things and therefore all their powers. Or He may let every law continue in action, but neutralize or counteract a force by a stronger force in a different direction. An evident interference of God with the workings of physical agents is called a **miracle.**

122. **Thesis VI.** *The laws of nature are not absolutely immutable, and therefore miracles are possible.*

Proof. That is not absolutely immutable to which God can make exceptions; but God can make exceptions to the laws of nature, for He can do all that involves no contradiction; but that God should make exceptions to the laws of nature involves no contradiction. If it did, the reason of it would be either, (*a*) That the natures of material things are absolutely necessary beings, existing and acting independently of God's will; or, (*b*) That making exceptions to general laws would suppose a change of mind in God with regard to the permanence of His own laws; or, (*c*) That such exceptions would be unworthy of God's wisdom. But these reasons are invalid; because, (*a*) The natures of material things exist and act only in as far as God gives them existence and action; He may, therefore, suspend their action or produce effects that shall neutralize their action, and that shall cause even opposite results. (*b*) When God wills an exception, He wills it from eternity. (*c*) It is wise, on the part of God, to reserve to Himself means of evidently controlling His creation, and thus manifesting His will to man. Now, miracles are such means of Divine manifestations, and are therefore possible to God.

123. **Objections:** 1. Hume and others have learnedly proved

a priori that miracles are impossible. *Answer.* All their arguments are easily refuted; even Huxley acknowledges the possibility of miracles, saying: "No one is entitled to say *a priori* that any given so-called miraculous event is impossible, and no one is entitled to say *a priori* that prayer for some change in the ordinary course of nature cannot possibly avail." ("Science and the Bishops," *Nineteenth Century*, Nov., 1887.)

2. An all-wise Creator should have made the world so that it needed not His interference. *Answer.* The material world does not need God's miraculous interference; but God cannot deprive Himself of the power to interfere with it when He sees fit to do so; for instance, when He manifests His will supernaturally to His intelligent creatures.

3. God could manifest His will by affecting directly the intellects of men. *Answer.* He could do so, and does so frequently; but it is natural to man to obtain his knowledge by sense and reasoning.

4. The physical laws flow from the very natures of things, therefore they cannot be suspended while their causes exist. *Answer.* The physical laws need not cease to exist during the miracle, but a stronger power may prevent their effects; thus, our hands do not cease to be heavy bodies while our will raises them up.

5. Miracles only complicate the economy of nature, and thus destroy the beauty of order. *Answer.* They introduce into the world a higher beauty than that of mere physical regularity.

6. It is an analytical principle that the order of nature is constant. *Answer.* We deny this; unvarying constancy is not contained in the idea of order. It is an analytical

judgment that there must be order in the works of a wise Creator; but order does not, as we have seen, exclude all exceptions. It is the adaptation of means to ends; now, miracles are well suited to the ends for which they are wrought.

7. If there could be miracles, the physical sciences would cease to give certainty. *Answer.* If miracles were of such frequent occurrence that we could not distinguish their effects from natural effects, we grant; else we deny.

8. Miracles are, at least, opposed to physical certainty. *Answer.* Not at all: we have physical certainty regarding what must happen when no miracle interferes, but we have no physical certainty that no miracle ever happens; on the contrary, we have physical certainty of the miraculous facts when we witness them.

9. We have physical certainty that a given miracle did not happen, and only moral certainty that it did happen; now, physical certainty is stronger than moral. *Answer.* We have no physical certainty that a miracle did not happen, but only that a certain effect could not proceed from natural causes; we have moral certainty that the miracle did happen, *e. g.*, that Christ raised Lazarus from the dead: both physical and moral certainty are true in their own lines.

10. Miracles could answer no wise purpose unless they could be known to be miracles; but they cannot be known; for any strange fact may come from some unknown law of nature. *Answer.* An objection that proves too much must be unsound; now, this objection proves too much; for, if it were valid, we could form no scientific induction whatever until we knew all the

natural laws, else what we attribute to one law might be due to another, hidden law. We could then never predict any fact with physical certainty. With regard to miracles, we need not know all the laws of nature to form, *e. g.*, the certain judgment that a dead man cannot return to life by any power of nature.

11. We do not know the full power of the devil; therefore we never know whether God works the wonder. *Answer.* Some facts are evidently the work of the Creator, *e. g.*, the restoration of life to the dead; for this implies supreme dominion over the noblest beings of this world. Besides, the circumstances of the miracle are often such that, if it could be from evil spirits, mankind would be invincibly led into error, and all means would be taken away by which the action of God could be outwardly manifested to the world: thus God would unwisely deprive Himself of what is evidently His sole right. For instance, if the miracles of Christ and His followers as a body could be diabolical deceits, then God Himself would be accountable for the deception of the best portion of mankind.

12. The moral laws are immutable; therefore the physical laws too must be so. *Answer.* There is no parity; it is unholy to violate the moral law; but to oppose the action of a physical law implies nothing that is unworthy of God.

13. The mesmeric fluid is capable of wonderful effects; it may produce many so-called miracles. *Answer.* Effects which may be produced by a mesmeric fluid must not be called miracles; but many things are falsely claimed for a mesmeric fluid—*e. g.*, it is not possible that any material fluid should produce acts of

intelligence, as when the medium is made to speak a language never learned by the person, and to know secrets unknown to all other men; often an invisible intellectual agent is present, distinct from all men concerned. (See Nos. 172–174.)

124. Besides, both with regard to the power of the devil and the strange effects claimed for mesmerism, hypnotism, etc., in many cases it can be clearly found out from the circumstances of the concrete fact in question whether it is the work of God or of the devil, or may be within the power of material nature; and in all cases where this cannot be discovered we must suspend our judgment and not pronounce the fact to be miraculous.

To discern whether a certain effect may proceed from mere physical or material causes, we must observe whether the effect is always the same while the circumstances remain identical. If not, then the causes are not material, since the same physical causes must ever produce the same physical effects in the same physical circumstances.

Since a miracle is a *manifest* interference of God with the working of physical agents, it is evident that we should not call an astonishing event a miracle, unless we know for certain that it is due to God's interference. Now, God may interfere in two ways: either directly, by Himself, or indirectly, through the ministry of His good Angels. When the wonderful event produced implies the action of creative power, it comes from God directly; for no finite being can create, or be the total cause of a new substance. Such acts are said to be **miracles of the first class**; while **miracles of the second class** are those that can be produced by the instrumentality of the good Angels acting as ministers of God. This supposes that the Angels have certain powers over matter. Now, the devils are of the same nature as the good Angels, and they, likewise,

have certain powers over bodily substances, which, however, they cannot exercise independently of God's permission.

125. How shall we know whether, in a given case, the effects produced are not owing to the action of the demon? Evidently, we must have some test or criterion to distinguish true miracles of the second class from mere prodigies of Satan. If we had no test, a miracle of this class could not be known to be from God, and, therefore, could not be an undoubted sign of His will. And, since men cannot readily discern in most cases what wonders require creative power and what others do not, God would deprive Himself of the power of exhibiting His interference to men, if we had no means whatever, no reliable test, whereby true miracles can be discerned from diabolical deceits.

The criterion is this: That everything concerned in the wonderful event be worthy of the holiness and the wisdom of the Creator and His blessed Angels. Hence, we know that an evil spirit is at work if:

1. The preternatural effect is produced in favor of a doctrine or principle which is certainly known to be false, as being either self-contradictory, or against morality, or against a well-established point of Revelation.
2. If the prodigy can answer no purpose worthy of God; for instance, if it were chiefly intended for the gratification of idle curiosity, or for money-making, etc.
3. If the human agent who claims to be the wonder-worker were actuated in such performances by unworthy motives; for instance, by the love of human glory or any inordinate passion.

When the application of this criterion leaves a reasonable doubt as to the genuineness of the miracle, we should not pro-

nounce the effect to be miraculous. For while, before a court of justice, a man is accounted innocent until his guilt be proved, the presumption being in his favor, we claim no such presumption in favor of miracles; on the contrary, we accept none as certain unless it be demonstrated beyond a doubt that the wonderful event cannot be due to any natural agent, nor to the preternatural agencies of the evil spirits.

CHAPTER IV.

THE CONSTITUENT ELEMENTS OF MATTER.

126. We may consider matter as extended substance possessed of different powers according to its different species; or we may consider it as to its further constituent elements of potentiality and activity, whatever be its species. Considered in the former way, matter is divisible into *homogeneous* particles, *i. e.*, into particles of the same nature as the entire mass. Many species of matter can be further dissolved into chemical particles, which are *heterogeneous*, *i. e.*, of different natures; thus, water can be decomposed into oxygen and hydrogen. Oxygen, hydrogen, etc., are not known to be further resolvable into other particles; they are called *simple elements*, not as if their particles had no extension, but to distinguish them from the molecules of chemical compounds.

127. We are now to investigate the **ultimate composition** of bodies, even of molecules of matter, whether they be chemically simple or compound. The following is the explanation given by Plato, Aristotle, St. Thomas, and by the Schoolmen generally; it is called the **system of matter and form.**

Every one of the smallest particles into which a non-living body may be divided possesses, just like the whole mass, certain powers or energies, *e. g.*, affinities, attractions, etc.; for matter without powers would be a useless being, and a wise God creates nothing useless. The source of these powers, the active principle in matter, is called its **form**; by it a substance is constituted such a substance, and different from every other;

it is therefore its substantial form. In living bodies the source of their energies is not in each separate particle, but in the one life principle which determines the species of each plant or animal; of the vital form we shall treat in *Psychology* (Nos. 139, etc.).

Besides the forms, which differ for the different species of bodies, there is something which is the same in all material substances, viz., the principle of extension; it is matter in its first abstract entity, and may be called the *potential principle*, the prime matter, or *materia prima* of the Schoolmen. It cannot exist by itself without some form, for all matter is some kind of matter. This potential principle thus informed by the active principle is, in its ultimate particle which we are now considering, a natural or **physical unit**; it naturally occupies some space which has extension in length, breadth, and thickness. But being a physical unit, though extended, the ultimate particle is not physically divisible into smaller parts. The space, however, which each particle occupies is indefinitely divisible. For instance, when hydrogen and oxygen unite to constitute a molecule of water, their potential principle remains, but their active principles cease to exist as such and are succeeded by a new active principle, that of water.

128. This form of water is said to be **educed out of the potentiality of matter**—*i. e.*, that same prime matter which before was of the nature of oxygen and hydrogen now becomes of the nature of water; before the change it was in **potentiality** to become water, now it is *actually* water; somewhat as a cubic block of wax can become a ball of wax. The change of a square block to a ball of wax is a change of an accidental form, that of one substance into another is a change of the substantial form. The active principles of the simple elements do not, as such, or formally, remain in the compound, yet they may be said not to have perished altogether; they exist still

in the power or virtue of the compound, which can reproduce them, just as the ball of wax can become a square lump again.*

129. If from a mass of non-living matter any physical particle be detached, it remains of the same nature as the mass, and has its own potential and active principle, its matter and form; but in a living mass, an organized body, be it plant or animal, while the potential principle of all the particles remains, all the forms which may have informed the single particles, before being taken into the organism, have ceased to exist as such, and are replaced by the one active principle or form which is the **vital principle** of the plant or animal. It is the form that constitutes any material substance in its species; from the form proceed all its powers of action; the properties which a body derives from the potential principle are extension, divisibility, and, in general, whatever is common to all matter. In a **crystal** there appears to be one principle of action pervading and thus unifying the whole mass, building up the structure on one plan; in this crystals appear to agree with living beings, though, as we shall explain in *Psychology*, they differ from them in many essential respects. (See No. 140.)

130. **Two other systems** of explaining the constituent elements of matter are advocated by other schools of philosophy. The **dynamic theory**, not unknown to the ancients, after being remodeled by Leibnitz, owed its first popularity to the further improvements made in it by Roger Boscowich, S.J., and later by Kant. It teaches that the ultimate elements of matter are *simple unextended particles*, called *monads* (μονάς, unit), all of

* Chemists claim, besides, that some of the properties of the simple substances are preserved in the compounds, in particular their chemical affinities: so that in a molecule or atom of water the affinities of hydrogen and oxygen continue in a manner to exist. They add that spectral analysis shows that the 'spectra' of the simples do not altogether vanish from the 'spectra' of the compounds. (See Pesch, *Institutiones Philosophiæ Naturalis*, No. 132.)

which are homogeneous, and endowed with powers of attraction and repulsion. As each of them occupies only a mathematical point, no number of them could ever make up any bulk, or produce extension, except for their mutual repulsion; and they are kept together by mutual attraction.

131. The **atomic theory** teaches, as its fundamental truth, that the ultimate particles are extended and yet indivisible; they are called *atoms* (ἄτομος, indivisible). This system agrees with the scholastic in affirming that there are ultimate particles of matter which are extended and yet cannot be physically or chemically divided into smaller particles. But it differs from the scholastic theory in denying that the atoms consist of a potential and an active principle, the active principle constituting the specific difference of bodies. It gives no satisfactory reason why the extended atoms are not divisible, since it supposes that they are not constituted as units by a simple form which demands a definite size as well as it demands definite powers. Nor does that theory explain satisfactorily the specific powers of bodies, *e. g.*, of iron and gold. Some writers suppose that the atoms differ specifically, but attempt no explanation; others suppose that the difference consists only in the figure, size, or motion of the atoms.

132. **Thesis VII.** *There are in matter two substantial principles, that of extension and that of specific action.*

Proof. Bodies can undergo substantial changes; but they could not do so if there were not two substantial principles, that of extension and that of specific action; therefore these exist.

We prove the major: Bodies can undergo substantial changes—*e. g.*, water is not a mere mixture of hydrogen and oxygen, but it is a new substance into which the elements are changed. This truth is proclaimed by common sense, by the languages of all nations, and even by the manner of speaking

UNIVERSITY OF CALIFORNIA

of those very philosophers who implicitly deny this fact; few will attempt to deny it explicitly. In fact, all draw a distinction between a mere mixture, *e. g.*, the atmospheric air, and a chemical compound.

We prove the minor: No substantial change of matter is possible unless there be two substantial principles. For in a substantial change something substantial must remain, else there would be a creation of the new substance, not a change from the old; and something substantial must go and come, or be exchanged; for if what is exchanged is only accidental, *e. g.*, figure, arrangement of parts, etc., then the change is accidental and not really substantial. Now, it is noticed that extension always remains, and the specific powers are changed; therefore there are in matter two substantial principles, that of extension and that of specification.

133. It will be noticed, on careful consideration, that neither the **dynamic** nor the **atomic** theory can satisfactorily account for truly substantial changes; for both admit only one substantial principle, which the dynamic calls simple and the atomic extended, but which both theories suppose to be permanent; so that what is changed in the formation of new substances is only the accidents of quantity, figure, motion, etc. If such were the fact, the new bodies would not differ substantially from their elements.

Besides, the **dynamic theory** does not account for extension; for no number of simple monads can fill a space; and the supposition that those monads possess attraction and repulsion does only attribute to one principle two contrary effects, which is anything but scientific. On the other hand, the **atomic theory** does not explain how the atoms can be extended and have certain figures, and yet cannot be separated into parts; nor does it account scientifically for the specific differences.

It belongs to **Chemistry** to study the phenomenal properties of the simple elements, but to Metaphysics to go back of the phenomenal and study the inmost essences of things material and immaterial. In doing so, the metaphysician must take into account all that the phenomenal can teach him. If he is mistaken about the effects, he is apt to misunderstand the nature of the causes. It is, therefore, not a little remarkable that the theory of matter and form, laid down in ages when the physical phenomena were so little understood, should still to-day account more plausibly than any other for all the facts which Chemistry, Biology, and other modern sciences have discovered. And yet such is the case, as is proved by Father Harper in his *Metaphysics of the Schools* (vol. ii. b. v. c. ii. § 4).

CHAPTER V.

THE GENERAL PROPERTIES OF BODIES.

134. The principal **properties common to all bodies** and to no other substances are *extension*, *impenetrability*, *figure*, *local motion*, and *inertia*.

I. **Extension** is continuous quantity, or that property of a body by which it has parts outside of each other and so united by a common bond as to constitute a physical unit. That this property really exists in bodies we know for certain by the testimony of our senses. Still, the essence of bodies does not consist in extension, as Descartes supposed; for space, too, has extension, and yet it is not a body. Extension is natural to bodies, but it is not, therefore, essential to them. True, every body has parts distinct from each other; besides, quantity gives parts a tendency to be outside of one another; next, this tendency is actuated if not divinely impeded. But it may be divinely impeded; and when this happens, as it does with regard to the Body of our Lord in the Holy Eucharist, the parts of the body are not outside of each other; but the sacred Body of Christ is present, after the manner of a spirit, being whole in every part of the species.

135. II. **Impenetrability** is the property by which one body excludes another from the place it occupies. It is natural to bodies, and the tendency thus to exclude other bodies is even essential to bodies; still, its effects can be suspended by the Almighty, as can all action of any created substance. In such a case two or more bodies could occupy the same place, as

when the risen Saviour entered the Upper Room, though the doors were closed. On the other hand, it is not absolutely impossible, because not self-contradictory, that one body should, by **reduplication** of its relations, be in two or more places at the same time.

136. III. **Figure** is an accident of continuous quantity which results directly from its limitations; for whatever is limited must have definite limits; these definite limits to extension constitute figure. The natural figure of a body is determined by its substantial form; for the form gives to the body every determination that belongs to such a species, though its effects in individual beings are influenced by present circumstances. Thus, the forms of metals determine the figures of their crystals; so with plants and animals; still, circumstances may favor or impede the action of the form in each individual case, as when a plant is dwarfed in a cold climate.

137. IV. **Local motion** is the successive transition of a thing from one place to another. It supposes a *subject*, a *term* to which the subject tends, a *force* impelling it to that term. If only one body existed, there would be no such a term, and therefore no motion in the strict meaning of that word, though an impelling force might exist, and cause in that body a mode which might analogically be called motion. Local motion, then, implies a change of place; but **spirits** are not in a place, in the same sense that bodies are in a place, and therefore motion is not predicated of them in the same sense. Spirits, as such, have no necessary relation to matter, and may have been created before matter; but place and local motion are properly accidents of matter only, and therefore cannot affect spirits except indirectly, inasmuch as spirits may be in union with a body, either substantially, as the soul of a living man, or virtually, as when an Angel protects a child. (See St. Thomas, *Summa*, i. q. lx. 4, 1^{um}.) In this latter case he

exhibits his presence in space and acts in space, but is not limited by space.

138. V. **Inertia** does not mean that bodies, as such, have no powers to act, but that they cannot of their own accord begin to act or cease to act, or make any change in their mode of acting. The reason of this impotence lies in the fact that bodies, as such, *i. e.*, as mere material substances not informed by a vital principle, have no perceptions, and therefore no motives to determine their actions in one way rather than another; therefore they can only act uniformly and without spontaneity or power of self-determination. Intelligent and sentient beings, on the contrary, can know a term to which they may tend, and therefore determine themselves to motion or rest, or to one motion rather than another. Intelligent beings may do so freely, because they apprehend the term as unnecessary; but those that are merely sentient, as brutes are, act necessarily upon the stronger attraction; still, their actions, unlike those of non-sentient things, are determined by their instinct, which is a principle intrinsic to themselves.

BOOK III.

PSYCHOLOGY.

139. **Psychology** is the study of living things (*ψυχή*, the vital principle). Now, life consists in the power of immanent action—*i. e.*, in action that affects the agent alone; its effect is self-evolution and self-perfection.

There are **three degrees of life**: vegetative, sensitive, and intellectual life. These rise in dignity above one another as they become more independent of matter:

1. **Vegetative life** needs material organs and assumes into itself material food; still, it is so far above mere matter that it controls the physical and chemical powers of such food, which it converts into its own substance.
2. **Sensitive life** also needs material organs, and perceives only material things; but it assumes into itself the images only of the objects, not the gross matter, in its action of sense-perception.
3. **Intellectual life,** as such, needs no material organs, nor even material images: the soul can understand things entirely immaterial, and material things in an immaterial manner, though, as long as it is substantially one being with the body, it understands its objects in connection with bodily phantasms. We distinguish,

therefore, all living creatures to which our natural knowledge extends into three classes or genera, viz.: **plants**, which have only vegetable life; **animals**, which have vegetable and sensitive life; and **man**, who has vegetable, sensitive, and intellectual life.

We shall consider: 1. The specific nature of plants and animals. 2. Sensitive and rational cognition. 3. Sensitive and rational appetite. 4. The nature of the human soul. 5. The origin and the destiny of the human soul.

CHAPTER I.

THE SPECIFIC NATURE OF PLANTS AND ANIMALS.

140. **Thesis I.** *Living bodies cannot originate from non-living bodies.*

Proof. The effect cannot be superior to the cause; now, there is something in the vital principle superior to all the powers of non-living bodies, no matter how these be combined with one another; viz., it gives living bodies essences superior to the essences of all inorganic bodies. For the essences of things are known by observing their properties and operations; now, all living bodies are observed to have certain properties and operations most of which are superior to those found in any non-living bodies; therefore, all living bodies have natures or essences superior to those of non-living bodies.

The two classes differ:

1. *In structure.* All living bodies, and they alone, are furnished with organs—*i. e.*, with parts of peculiar structure suited to perform vital acts.
2. *In figure.* All living bodies have determined figures proper to each species, and these figures are bounded by curved lines; while non-living bodies have no determined figures, except crystals, and these are bounded by straight lines.
3. *In growth.* Living bodies begin with a cell, from the evolution or multiplication of which the whole organism gradually arises; this development proceeds by

means of nutrition, or intussusception of food, which is transformed into the living substance. Non-living bodies do not arise from a cell; and they increase by juxtaposition of particles from without.

4. *In origin.* Living bodies never come but from germs produced by other living bodies; for the cells cannot be formed by mere chemical combinations, though all the simple elements be present in the proper proportions.
5. *In chemical action.* The vital principle of plants enables them to decompose carbonic acid into its simple elements of carbon and oxygen, absorbing the carbon by their leaves, thus overcoming its strong affinity for oxygen; while animals, inhaling oxygen, which so readily destroys dead matter, use it to support their animal life.
6. *In unity.* All the elements composing any plant or animal obey the vital principle which directs them to procure the preservation of the individual and of the species.
7. *In duration.* Living bodies have a limited period of existence, while non-living ones are independent of time.

Objection. Fungi and maggots are generated by dead matter. *Answer.* They come from living germs floating in the air; the leading scientists are agreed that there is no spontaneous generation, but that, as nature is now, all living plants and animals come from living germs. As to the question whether the Creator could possibly establish spontaneous generation, see No. 158.

141. **Thesis II.** *All plants differ essentially from all animals.*

Proof. The essences of things are known by observing

their properties and operations. Now, all plants are confined to these three functions: nutrition, growth, and reproduction; while all animals exhibit, in addition to these, the power of sensation, and, as a consequence of sensation, an appetite for sensible good, and a shrinking from sensible evil. There is, besides, in all animals an appropriate power of motion, which enables them to move instinctively upon the apprehension of good or evil. Therefore all plants differ essentially from all animals.

142. **Objections:** 1. Of some living things—*e. g.*, of sponges—it is not certainly known whether they are plants or animals; therefore, the difference between them is but slight and cannot be essential. *Answer.* The difference between plants and animals is the power of sensation; though but slightly manifested, it constitutes an essential difference; so that if sponges possess it, as they seem to do, they are animals; if not, they are plants.

2. The sensitive plant has sensation, as its name indicates, and still it is not an animal. *Answer.* It has no sensation; its scientific name is "mimosa," because it mimics sensation; its leaves are mechanically contracted by outside influences, not by its own immanent action.

3. The sunflower turns its face to the sun, the tulip closes its petals at night, etc.; therefore they perceive the sun, the night, etc. *Answer.* The physical action of the sun and of the damp air upon those plants produces these mechanical effects.

4. But many plants grow towards the light, and growth is not mechanical action. *Answer.* The growth comes from the life-principle in the plant, but its effects are modified by favorable influences on the side of the

light, and by unfavorable influences on the opposite side; this argues no power of sensation in the plant.

5. It cannot be proved either *a priori* or *a posteriori* that animals feel and plants do not. *Answer.* (*a*) It is known by the judgment of common sense. (*b*) It is proved scientifically by observing that all animals, even the lowest species which are certainly known to be animals, have organs of sense, while no plants, even the highest, possess these. Besides, animals have motions which cannot be explained except as consequent on the power of sensation, and they give signs, by cries, etc., of pleasure and pain, which no plants ever do.

143. **Thesis III.** *All the vital acts of an animal flow from one vital principle.*

Proof 1. Nutrition, growth, and reproduction in plants are not attributed to three distinct principles, but to one, the vegetative principle; because the effects are subordinated to one another, and thereby show a unity in the cause. *A pari*, since all the functions of life in an animal are subordinate to one another, and co-operate harmoniously to one common end, there must be unity in the cause; *i. e.*, there must be but one principle from which proceed all the vital acts of animals.

Proof 2. If the animal were composed of two vital principles, it would be two beings; for the vegetable would not be the animal, nor the animal the vegetable, but all men judge the animal to be one being endowed with vegetative action, yet not a vegetable.

144. **Thesis IV.** *The vital principle in any living body is truly the form of the body.*

Proof. The form of a body is that principle which makes it be such a body and not a body of another kind, which gives

it such powers and actions and not other powers and actions; in a word, which constitutes the body in its species.

Now, such is the vital principle of any living body. For, 1. If the vital principle ceases to animate the matter, as it does in death, all the specific powers and actions of that body cease. 2. The mere matter, as separate from the vital principle, may become successively the food and the very substance of different plants and animals, its specific nature ever changing with the vital principles that successively inform it. But this supposes that the vital principle constitutes it in its species, or is its form.

145. **Objection.** The substantial form of a body is simple, and therefore indivisible; but the vital principle of some plants is divisible; *e. g.*, a twig may be cut off and continue to live by its own life, the vital principle of the tree being divided. *Answer.* Simplicity has different meanings. We grant that all forms, as such, are simple; they are simple in two senses: 1, Inasmuch as they are not composed of matter and form; 2, inasmuch as they are not aggregates of parts quantitatively distinct, as bodies are. Just in the same senses is the vital principle simple, for it cannot be divided into matter and form, nor into parts quantitatively distinct. As to the curious question whether the principle of life is ever divided, we say that it exists whole and entire in the body and in every part of the body, so, however, that it can neither act, nor even exist, but in an extended body, excepting only the soul of man. To animate a body, the life principle requires a complete organism; therefore, when the organism is destroyed, the vital form ceases to be. Now, in many plants, and in a few of the lower animals, the organism is so simple and uniform throughout in its structure that, when divided, the several parts may still be suited to the functions of life. In such a case the principle of life may continue to animate the several parts; but it

is not properly said to be divided; rather the body is divided; for the vital principle is whole and entire in both parts, which now become two plants. It was before whole and entire in all portions of one body; it is now whole and entire in all portions of two bodies, and in this sense it is rather said to be multiplied than divided; or, better still, it is neither; but the animal or plant is divided. (See upon "Simplicity," *Inst. Phil. Nat.*, by Tilmann Pesch, S.J., No. 211.—Compare St. Thomas's *Summa*, p. 1, q. lxxvi., a. 8.) Thus the twig may become a distinct plant; thus, too, the segments of annulated worms, when severed from the rest of their bodies, become individual worms, this result being accomplished by the division of the matter and the multiplication, if you will, of the form. Other philosophers maintain that the principle of life is really divided in such cases; perhaps it is a mere dispute on words.

146. **Theses V. and VI.** *The brute soul is irrational and therefore ceases to exist when the organism is destroyed.*

Proof 1. It is a judgment of common sense that brutes are irrational or incapable of reasoning, and that their vital principles do not outlive their bodies.

Proof 2. I. **That the brute soul is irrational** is proved scientifically, (*a*) *By induction.* For it is found, by an endless variety of observations, that all the acts of brutes can be accounted for without supposing in them the power of reasoning, of drawing conclusions from premises; in other words, they give no signs of reasoning, and it would be unscientific to ascribe to them a faculty of which they give no indications. This becomes the more evident if we compare their actions with those of rational man. All men, in the full possession of their faculties, can grasp the abstract relation between means and ends, inventing and making new and various means, *e. g.*, tools, to accomplish their designs; brute animals never do so; they

can only follow the one beaten track to which their specific nature determines them. Hence, too, a man can improve himself by study, by exertions of his own talents; brutes cannot do this; they may be taught various actions by man, but they cannot improve *themselves*. Hence, too, a race of men may increase in knowledge and civilization; brutes act now as they were always known to act; and when, by the training of man or the change of physical surroundings, new ways of acting are brought about in some brute animals, it is found by experiment that all brutes of the same species would act in about the same way under those peculiar circumstances. Therefore the effects can be accounted for by reference to phantasms and organic modifications, without attributing to the brute the abstract perception of the relation between means and ends.

That brutes are irrational is proved scientifically, (*b*) *From the nature of reasoning.* Reasoning is absolutely impossible without universal concepts; for in all reasoning the middle term must be at least once distributed or taken universally. Now, brutes never give signs of having universal ideas: all their actions can be accounted for by means of sense-perceptions, phantasms, and instinctive action, which will be explained further on (No. 149).

II. **The brute soul ceases to exist when the organism is destroyed.** For it would be unwise to keep anything in existence which can answer no purpose; but the brute soul, when its organism is destroyed, can answer no purpose; therefore the Creator does not keep it in existence.

The *minor* is clear from the fact that all the functions of the brute soul—*i. e.*, nutrition, growth, reproduction, sensation, and motion—require bodily organs. Besides, it is an obvious principle that the nature of a being is of the same kind as its actions; now, the actions of the brute soul are all bound up

in matter, therefore the brute soul is so too; and, therefore, it cannot exist without matter.

147. Some obvious **corollaries** follow from this: 1. That the brute soul, unlike the soul of man, cannot exist by itself; it is only the substantial form of the brute body. 2. That it needs no creation to bring it into existence; it is educed out of the potentiality of matter, as are the forms of inorganic bodies; with this difference, that the brute soul, unlike those forms, is not educed from matter except by the action of a living agent of the same species.

148. **Objections:** 1. Many actions of brutes manifest design, the intelligent adaptation of means to ends; *e. g.*, when a bird builds its nest. *Answer.* This is true; but the design is not in the animal, but in Him who made the animal such that it must act in that manner—*i. e.*, in the Creator; just as the intelligence that guides the hands of a watch is not in the watch, but in its maker.

2. The watch does not perceive, while the brute does; there is no parity. *Answer.* There are many cases in which the brute acts for a remote end of which it has no more knowledge at the time of its action than the machine has of the purposes of its maker; as when the bird builds a nest for its future offspring, the bee stores up honey in summer for its support in winter. The intelligence thus displayed is certainly not in the brute animal.

3. But the brute displays intelligence in directing means to proximate ends which it presently apprehends, as when it eats to satisfy its hunger and prolong its life. *Answer.* The future prolongation of life is not intended by brutes; they merely apprehend by sense the sensible good of food to satisfy their sensible appetite. The

brute apprehends things in the concrete; there is no abstraction, and therefore no reasoning.

4. If a dog is called by his master, he will run around by a gate or by a staircase, just as a rational man would do; here he displays reason as well as man does. *Answer.* We know from other sources that man has reason. Such actions as the dog performs can all be explained by the sense-perceptions and the phantasms of the brute, together with its appetites and instincts, which we shall explain further on (No. 149).
5. Some brutes can understand language; they must therefore have abstract ideas. *Answer.* They merely associate certain familiar sounds with familiar phantasms. The parrot can even be taught to utter articulate sounds associated with his sensible appetites.
6. Darwin shows that some brute animals have improved themselves; for instance, that the dog has six different barks to express six different feelings. *Answer.* Darwin does not prove that dogs have not always possessed the same accomplishment, but have invented it; if dogs may always have used the same barks, their progress is not proved.
7. Some brutes learn to avoid traps, and one rat, for instance, will avoid them more skillfully than others. *Answer.* The association of phantasms suffices to produce this skill; and one rat may have acquired more of such experience than another. Besides, animals of the same species may have a more or less perfect organism, and, therefore, more skill in animal actions.

149. While brute animals have not the faculty of reason, they have a power or aptitude for the proper guidance of their actions which supplies for them the place of reason; it is called

instinct. It may be defined as the natural impulse that prompts animals to do what is useful to the individual and to the species. It is not something superadded to the animal, but it is the sensitive tendency of its sensitive nature—for instance, its inclination to eat when hungry, to rest when fatigued, etc.

150. Instinct prompts animals, not only to embrace what they sensibly apprehend as present good, and to shun what they apprehend as present evil for themselves; but also to do those **preparatory actions** which are naturally and sensibly connected with the gratification of animal appetites, such as looking for food, retiring to their lair, and even excavating a hole, spinning a web, storing up food, building a nest, etc.

151. In all instinctive actions there is **an adaptation of means to ends,** proximate and remote. The brute animal organically apprehends the nearer sensible ends, and such connection between means and ends as can be represented by phantasms; for instance, it perceives the sensible satisfaction of eating and resting, and the material relations between itself and its food and lair; but it does not apprehend the more remote ends, such as the future prolongation of life, the future propagation of its species, etc. The entire adaptation of means to ends, manifested in the workings of animal instinct, is the work of the Creator, who made the nature, the powers, and the tendencies of animals such as we find them at present.

152. We can the more easily understand the **workings of instinct,** because we experience them in ourselves. In brutes, however, they are far more perfect than in man, for they are intended by the Creator to be the sole guides of their actions. In man they are to be supplemented by the nobler faculty of reason, to which instinct is intended to be subservient. On many occasions we have nothing but instinct to guide us, as

in early infancy and in many animal functions throughout life, such as breathing, swallowing, sleeping, closing our eyelids at the approach of danger, withdrawing our tongue before the closing teeth, etc. In all such adaptations of means to ends we know that reason has usually no part. On many other occasions we are conscious that we are drawn one way by our sensible appetites and another way by our reason; the latter ought then to be obeyed.

153. **Thesis VII.** *Plants and brute animals are intended for the use of man.*

Proof 1. The purpose for which an object is intended, especially when it is of a complicated and delicately adapted structure, can be known by examining its fitness to accomplish a certain end or purpose; else we should have to grant that the striking adaptation of means to ends is an effect without a proportionate cause. Now, plants and animals are most delicate contrivances of intricate structure, and they are admirably adapted to the use of man. Therefore they are made for it.

Proof 2. All things are created for the extrinsic glory of God (Nos. 113 to 115); now, irrational things cannot by themselves glorify God, but only through man, being in some way of use to man; hence they are intended for the use of man.

154. **Irrational creatures may be of use to man,** and thus glorify God through man, in various ways: 1. By displaying to the eyes of man the power, wisdom, goodness of their Maker, and thus prompting man to love and praise God. 2. By supplying the bodily wants of man, and thus aiding him to serve God. 3. By administering aids to his rational pleasures, thus inducing him to love his God, and to serve him cheerfully. 4. Even things which molest man, such as the inclemencies of the seasons, beasts of prey, troublesome insects, etc.,

render service to man, making him more industrious, cleanly, provident, etc., and enabling him to bear the ills of life in the spirit of dutiful submission to the sovereign will of God.

155. **Objections:** 1. Many creatures are absolutely useless or even injurious to man. *Answer.* There are creatures of which we do not know the use; but it does not follow that they are of no use. From the fact that the vast majority of creatures are known to be very useful, we should rather conclude by induction that the others also answer a useful purpose.

2. Some plants and animals are known to be injurious. *Answer.* They may be injurious in some respects, and yet be very beneficial in other respects; thus, poisons become medicines in the hands of science.

156. **Thesis VIII.** *The species of plants and animals are fixed—i. e., incapable of transformation.*

Explanation. By a **species** we mean a class of plants or animals which have characteristic properties in common and can be indefinitely propagated without changing those characteristics. A species may indeed produce a **variety**—*i. e.*, one or more individual plants or animals marked by some striking peculiarity not common to the species generally. A **race** is a variety perpetuated through several generations. Thus, in the canine species, we have many races that differ considerably from one another; still, all have certain characteristics in common, which mark them as belonging to the canine species. By saying that the species of plants and animals are fixed, we do not mean that no new races may arise and be propagated; but we here assert that the changes will never result in the evolution of new species. The **crucial test,** by which the distinction of species is known, is this: if animals can be paired together and thus propagate an indefinitely fertile offspring, they are of the same species; else they are not. Thus

horses and asses are known to be different species, because, although they can by crossing generate the mule, still this hybrid is incapable of continued propagation. It is also important to notice that those scientists who maintain the evolution or transformation of species as a theory pretend that the new organisms evolved are usually more perfect than the antecedent species.

Proof 1. There can be no effect without a proportionate cause; but if higher species were evolved from lower, the improved new species would be without a proportionate cause. For inasmuch as the new species is more perfect than the old, it has no cause in the old. The new offspring of plants and animals may, at the most, have some accidental superiority over the parent stock, being born and raised under more favorable circumstances, but accidental changes constitute no specific difference.

Proof 2. By induction. Though scientists have now been at work for many years in exploring lands and seas, in examining the fossil remains of countless species of plants and animals, and in applying all the inventive genius of man to obtain and perpetuate new varieties and races, they have never yet been able to exhibit a single decisive proof that a transformation of species has ever taken place. Animals are now as they are represented on the pyramids or found mummified in the tombs of Egypt, as they were before they left their fossil forms in the rocks. Many species have become extinct, others are found now of which no very ancient specimens have been discovered; but it cannot be proved that any species was ever evolved from any other.

Proof 3. That the test of indefinitely continued fertility in the species is the crucial test by which the theory of evolution must be judged, and that the theory cannot stand this test, is acknowledged by its ablest advocates. "Without verifica-

tion," says Tyndall, "a theoretic conception is a mere figment of the intellect" (*Fragments of Science*, p. 469). "Our acceptance of the Darwinian hypothesis," says Huxley, "must be provisional as long as one link in the chain of evidence is wanting; and as long as all the animals and plants certainly produced by selective breeding from a common stock are fertile, and their progeny are fertile with one another, one link will be wanting" (*Man's Place in Nature*, p. 107). Therefore, the theory which contradicts our thesis is a mere figment of the intellect. (See No. 209.)

157. **Objections:** 1. Paleontology shows that the fossils found in the higher strata of the earth belong to more perfect species of plants and animals than those in the lower strata; there must have been an evolution of less perfect into more perfect species. *Answer.* The fact stated is not found to be true in all cases; but even if true, it would only show that there is order in the works of the Creator, not that the higher species are evolved from the lower. *Post hoc, ergo propter hoc*, is a sophism.

2. Anatomy proves that all the forms of life are constructed according to a uniform type or plan, so as to constitute a regular system. *Answer.* This, too, shows that there is symmetry in the works of God, but not that there is evolution of species in nature; you might as well say that all Gothic buildings are evolved from one another.

3. Anatomy also reveals the fact that the more perfect animals retain certain rudimentary organs which are of no present use, and which are mere remnants of a former useful structure; therefore evolution has taken place. *Answer.* Anatomy does not prove that the so-called rudimentary structures are of no use to those higher animals; they serve, at least, for ornament, and

give symmetry to the creation. Darwin classes our sense of smell and our external ear among these useless remnants, while it is certain that they are very useful; such pleadings exhibit much weakness in the theory.

4. Geography shows that certain species of plants and animals are peculiar to certain climates; therefore the influence of the climate must have produced them. *Answer.* The wisdom of God has provided for each climate its appropriate fauna and flora, usually by the natural process of variety of races, never by the evolution of new species.

5. Physiology has discovered that the embryo of a higher animal species passes through the forms of all the lower species in its process of evolution. *Answer.* The development of an individual animal is one thing, and that of species from species is quite another; the one fact does not prove the other. Besides, the statement itself is inexact, and the order of embryonic evolutions is different in different species.

6. A worm becomes a butterfly; therefore a less perfect animal may be developed into one more perfect. *Answer.* Only those worms become butterflies which come from the eggs of butterflies; the species remains unchanged.

7. Even the Schoolmen admitted the possibility of spontaneous generation—*i.e.*, of the generation of an animal from brute matter only, without a living germ. *Answer.* They admitted it as possible in connection with a higher influence proceeding from a heavenly body, but not as resulting from the combination of merely material elements; this higher influence might, in their opinion, replace the living germ, thus showing that they felt convinced that life cannot proceed from lower elements

only, no matter how combined. (Pesch, *Inst. Phil. Nat.*, No. 190.)

158. It may be asked whether the Creator could have established a series of **evolutions from less perfect to more perfect species.**

Reason answers that God can do all that is not self-contradictory. Now, such a series, taken in one sense, would be self-contradictory, but not in another sense. It is absurd that a superior effect should proceed entirely from an inferior cause, but not that God should supply by His own action whatever perfection is added to the effect—*i. e.*, to the new generation. Nor is it evidently impossible that the Creator should direct the evolution of a lower into a higher species by the agency of second causes, wisely combined for that purpose. But it is metaphysically impossible that a merely fortuitous combination of causes, without a wise designer to direct the work, should build up a most wonderful system of development, running through the whole vegetable and animal kingdoms, such as scientists claim that evolution has accomplished. To say that merely blind forces produce so much beauty and harmony, is fully as absurd as to pretend that a man can compose a grand and harmonious poem without knowing a word of the language in which it is written. A system that ascribes effects to totally inadequate causes is unscientific.

CHAPTER II.

SENSITIVE AND RATIONAL COGNITION.

159. In our treatise on Critical Logic we have devoted a whole chapter (Ch. III.) to the explanation of the means by which certainty is obtained, entering into considerable detail on the subject of sensitive and on that of rational cognition. We have now to examine **the nature and the workings of those two faculties** in themselves; and we, therefore, add in this place such further details as were omitted before because they did not affect the certainty of human knowledge.

ARTICLE I. OF SENSITIVE COGNITION.

160. Speaking in *Critical Logic* (*Logic*, No. 142) of the outward senses, we remarked: "Two very different questions present themselves on this subject: 1. How far is the testimony of our external senses reliable? 2 How do the senses work so as to give us reliable testimony?" We then examined the first question; we are now to present the **Scholastic theory**, which answers the second query.

161. **How, then, is sense-perception effected,** whether it be considered in man or in the irrational animal? All animals have at least the sense of touch; perfect animals have the same five outer senses as man: the sight, hearing, taste, smell, and touch; they have also the inner senses, viz.: the common sense, imagination, sensile memory, and power of appreciation (*Logic*, No. 102). These are not mere instruments of

a most delicate structure, but they are living organs in which and by which the animal exercises its faculties. The purpose for which they are intended by the all-wise Creator is to enable the animal in different ways to acquire cognition of the material objects with which it comes into immediate or mediate contact. Now, cognition implies that an object impresses some likeness of itself upon the cognitive subject, and that the subject, reacting, expresses the object thus impressed, apprehending it vitally. Thus the cognitive subject perceives, not indeed a likeness of the object but, by means of the likeness, the object itself. This process is observed both in all sensitive and in our intellectual cognition.

162. Confining our attention, for the present, to sense-cognition, we notice two distinct steps in the act of perception. 1. The object perceived must act upon the subject perceiving, by impressing on it—whether directly, as in touch, or through a medium, as in vision—some likeness, image, or species of itself. This image is called by the Schoolmen the **species impressed,** *species impressa.* Hence it is clear that sense-cognition begins with the action of the object; and, as the object cannot give forth an image of what it is not, but only of what it is, therefore it tends essentially to beget true cognition in the subject.

2. The subject perceiving must not be merely passive; for then it could not be said to elicit the act of perception or sensation; it must, therefore, react vitally on the impression received. And since all cognition is an immanent act, the sentient subject must reproduce in itself a vital image of the object. This vital image is styled the **species expressed,** *species expressa;* and the subject's immanent act of forming this vital image is its apprehension or cognition of the object.

163. The species impressed and expressed in sense-perception are, of course, **the images of material objects existing in the concrete.** Those objects are directly perceived by sense;

the species are no more noticed by the sentient subject than the picture formed on the retina of the eye is noticed by us in our acts of vision.

164. If it be asked **where the sensation takes place**, in the sense-organ, say the eye, or in the brain, we answer that both brain and eye and connecting nerves co-operate in the act of seeing; all these together constitute the complex organ of sight; but the act of seeing should be said to be accomplished in the eye, the act of hearing in the ear, etc.; for thus only can it be properly said that we see and hear the outward object, and not the image of the object, or a modification of our senses.

165. The **imagination**, on the contrary, does not act in the organ of the outer senses; but its organ is the brain. It exists in perfect animals, and may perhaps be wanting in lower species of sentient life, some of which appear to have no senses but those of touch and taste. The imagination is the faculty by which animals form to themselves organic images, called phantasms, either of sensible objects perceived, or, in man at least, of other objects never perceived. In the latter case the images result from the combination of former phantasms, which themselves have been ultimately derived from objects of sensation.

166. The **sensile memory** performs a threefold office: (*a*) It directly brings back former phantasms; (*b*) Indirectly—*i. e.*, through the phantasms reproduced—it represents objects formerly perceived; (*c*) It represents them as having been formerly perceived.

167. There is one sensible power of cognition to which it was not necessary to advert in Critical Logic since it is not one of the means by which men acquire certainty; we mean the **power of appreciation**, the *vis æstimativa*, of the Schoolmen. It is the highest of merely organic faculties, because

it approaches the nearest to the intellectual power of judgment. Its action consists in apprehending certain concrete relations which sensible objects bear to the sentient animal. By it the lamb, even the first time that it sees a wolf, apprehends him as dangerous to itself; by it the bird apprehends a straw as just then suitable for its nest. Such apprehensions are often called *sensible judgments*. They differ from intellectual judgments: (*a*) In always dealing with concrete material things; (*b*) In apprehending by mere organic action the relations existing between such things and the animal subject; (*c*) In absolutely excluding all abstraction.

168. In connection with the imagination, referred to above, it is appropriate to give here a brief explanation both of *dreams*, which are chiefly the work of the imagination, and of *sleep*, which occasions dreams. **Sleep** is a natural interruption of the equilibrium between the various faculties of man; for we shall confine our remarks to the sleep of man. It arises from the exhaustion of the animal organism, and is ordained by nature to restore that organism to its former freshness. It differs from disease, which is an unnatural disturbance of the same equilibrium.

169. We should not, then, imagine that sleep is a cessation of vital action, but rather it is **a special mode of vitality.** In sleep, 1. All the vegetative powers continue to act, but more gently and with more uniform motion than before. 2. The action of the senses is more or less suspended. 3. The sensible appetites are much relaxed. 4. The intellect may act, but it is not fully conscious of its operations. 5. The will may act, but not freely; hence we are not accountable for its actions when we are fully asleep, and not fully accountable when we are half-asleep. Sleep is really a time of repairs to the body; during it the machinery of the organism is out of gear.

170. **Dreams** are series of phantasms, reproduced and combined anew by the fancy, accompanied at times by some intellectual activity, while the nerves of the body are relaxed in sleep. Dreams are often started by actual impressions on the slumbering senses—for instance, by some sounds or feelings—and they are greatly influenced by any abnormal condition of the nerves and the blood. Our phantasms are not isolated, but variously associated with each other by similarity, by congeniality, by having been formed contemporaneously, etc.; and thus, when one phantasm is aroused, others are thereby excited, whether we are awake or asleep. When awake, we can to a great extent regulate the workings of our imagination by our will, and we are inclined to do so in connection with our sense-perceptions; but when we are asleep, our fancy has full play, and may, for all we know, be constantly moving, though it may leave no traces of its vagaries. From the nature of dreams just explained it is evident how foolish it is to attach any signification to them as foretelling future events, unless on special occasions they should be preternaturally produced by Providence for worthy and important purposes.

171. **Somnambulism** is a dream giving rise to corresponding external actions. Somnambulists act outwardly in conformity with their imaginations, but in a strange manner. 1. They proceed as if they saw, while their eyes are closed or rigid; thus they will avoid obstacles in their way, yet they really do not see, but are guided by their mere imagining of the familiar places, and therefore they will strike against obstacles to which they are not accustomed. 2. They do bolder and sometimes more ingenious things than when awake; for they do not reflect on danger, and all their faculties are concentrated on one purpose. 3. On awaking, they have no recollection of their wanderings.

172. Phenomena similar to those of somnambulism are produced by the **mesmeric sleep.** Mesmer (A. D. 1733–1815) boasted of having invented an art of healing diseases by means of magnetism, which he excited by touching the sick with a firm will to restore their health. One of the means employed in that process is the artificial or magnetic sleep. Seeing that sleep is merely a natural disturbance of the vital powers, we find nothing astonishing in the production of an artificial sleep by natural means. Nor is it absurd to suppose that the mesmerizer may affect the slumbering faculties of the sleeper or medium, usually a nervous woman, and so influence her imagination as to direct, to some extent, her feelings and her outward motions. But the magnetizer cannot do this directly by his will or his intellect; these faculties are essentially incapable of acting outside of the soul, and the soul is not outside its living body.

173. Induction proves that the souls of men cannot, in our present condition, communicate or act upon each other except by means of the body, and therefore by means of matter. As long, therefore, as the effects claimed to be produced upon the medium can be the results of material influence, those effects may be natural; but many phenomena of mesmerism are beyond the reach of material causes, and therefore they are **preternatural.** For instance, it is claimed that the person magnetized may become possessed of new intellectual powers, such as mind-reading and the power of seeing what is beyond the reach of the senses; or the medium suddenly possesses knowledge of things never learned, as of the latent causes and the remedies of diseases, or exhibits familiarity with foreign languages, etc. It is the part of Philosophy to trace effects to adequate causes. Now, some of the effects attributed to mesmerism, when they are really such as they pretend to be and not mere jugglery, cannot have any adequate causes in

man, but only in spirits distinct from the souls of all those visibly present on such occasions.

174. The same test will apply to the phenomena of **spiritism**; namely, all clear exhibition of knowledge or intellectual action must be ascribed to an intellect as its source. If this cannot be the intellect of living men, then the effects must be ascribed, both in spiritism and mesmerism, to the agency of the evil spirits. For neither God, nor His good Angels, nor the souls in bliss could be supposed to put themselves at the disposal of spiritists or mesmerists, especially if we consider the unworthy and often immoral means employed by such men in their trades. Nor can a man claim control over the souls of the condemned; and, even if he could, it would be unholy and unwise for any one to make these his advisers and helpers. But it is perfectly conformable to the teachings both of reason and of Revelation to conclude that the evil spirits, or demons, are the agents of all such effects in spiritism and mesmerism as cannot be attributed to human power. Spiritism is explicitly forbidden in Holy Writ: "Neither let there be found any one among you that seeketh the truth from the dead. For the Lord abhorreth all such things." (Deut. XVIII. 12. See further Jouin's *Evidences of Religion*, pp. 74, etc.)

Article II. Rational Cognition.

175. From the explanation given in the preceding article it is clear that sense-perception consists in the formation, by the sentient being, of vital images representing the material objects perceived. Now, a similar process must be followed by rational or intellectual cognition: it too consists in producing an image of the object known; not, however, an organic, a material, but an intellectual image. For truth in the mind, logical truth, supposes that the mind is made conformable

to the object known; and it can acquire this conformity in no other way than by conceiving an image of that object. This point, then, is **common to sensitive and to rational cognition,** that both are accomplished by the formation, in the subject, of vital images representing the objects. Another point must be common, viz., both must derive the image from the object which it represents; else the cognition would not be certainly true, or conformable to the object known.

176. **But a difference between sensitive and intellectual knowledge** arises from the fact that, in sensitive knowledge, a material object impresses a material image of itself upon the material organ of sense; but it cannot impress a material image upon the immaterial intellect. The intellect cannot receive such an image into itself. It takes, **abstracts** from the material objects presented, or rather from the sensible phantasms of them, the intelligible notes of the objects; these are the immaterial images, impressed on the intellect as the *species impressed;* and re-acting, eliciting the vital act of cognition, the intellect forms the *species expressed*, thus completing the act of intellectual apprehension. The result or term of this process is an *idea:* here, then, we have the Scholastic theory which accounts for the **origin of ideas.**

177. The Schoolmen, always careful to give names to every step discernible in the analysis of any process, gave the name of **intellect in action,** *intellectus agens*, to the intellect when viewed as abstracting from the phantasms and producing the immaterial image, and the name of **receptive intellect,** *intellectus possibilis*, to the same faculty viewed as vitally receiving that image.

178. It may be asked whether all our ideas are obtained by a like process; and if so, how can we have ideas of things immaterial? Many philosophers have supposed that we have some **innate ideas,** ideas born in us, such as those of

truth, virtue, vice, etc. Others have gone so far as to maintain that all our ideas are inborn, and only awakened, not acquired, under favorable circumstances. These are idle suppositions, devoid of all proof and, moreover, liable to the serious objection that, if our ideas are not derived from the objective reality, they may be merely subjective, and our knowledge may be an illusion. But our ideas are truly derived by way of likeness from the objects themselves; and therefore our knowledge is objective and reliable.

179. Another false theory is that of the **Traditionalists**, who pretend that all our knowledge comes to us by tradition, —*i. e.*, by the teaching of other men. This is a most unsatisfactory theory: other men can only use signs corresponding to our ideas, but not put ideas into our minds. If they give us a sign to which none of our ideas corresponds, the sign is unintelligible to us: thus, no amount of explanation can make a man born blind understand the nature of color, or the formal difference between one color and another. There remains a last false theory, that of the **Ontologists**, which we shall later on refute with more detail. (See Nos. 187, 188.)

180. We must first consider how we get ideas of things immaterial, inaccessible to the senses. We have no intuitions of such objects—for instance, of virtue, vice, justice, truth, etc., nor of spirits, of God, of our own soul, etc. How do we get our ideas of all such things? The Schoolmen, in accord as usual with the ancient Peripatetics, or followers of Aristotle, clearly lay it down as a maxim that **there are no ideas in our intellect which we have not derived from sense-perception,** *nihil est in intellectu quod prius non fuerat in sensu.* This principle is true, but it needs explanation.

181. At first sight the saying appears absurd: we have an **idea of spirit,** but we have never beheld a spirit; how, then, can we be said to have derived this idea from sense-perception?

Let us consider what we mean by a spirit: we mean an immaterial substance capable of thinking and willing. Now, by our senses we perceive material substances. By our power of abstraction we look at substance only; we strip substance of all that is material in or about it. In conceiving a spirit, we affirm substance and deny matter: our idea of an immaterial substance is partly affirmative and partly negative; but all its elements are derived by abstraction from sense-perception. But how do we get the ideas of 'thought' and 'will'? We perceive acts of thought and will in ourselves by our consciousness. But how is consciousness connected with sense? We could not be conscious of our mental acts, if these acts did not exist; and they would not exist, if sense-perception did not prompt our minds to act. For no thought, and of course no volition, would arise in the human soul, if sensation did not call forth the exercise of our faculties. Thus we see that all the elements contained in our idea of spirit are traceable to sense-perception; the same holds for all our other ideas. In fact, if we were to examine all the ideas expressed in so intellectual a poem as Milton's "Paradise Lost," we should find in it no concept the elements of which have not ultimately arisen from sensation. Many of those concepts are not conformable to an objective reality, because they are not directly formed from objects represented by them; but inasmuch as their elements are derived from real objects, all ideas have a foundation in the reality. Such are, for instance, the concepts of Death and Sin, as Milton describes those creations of his poetic mind.

182. We are now prepared to give a connected and, as it were, **an historical account of the origin of our ideas** according to the system of those Schoolmen who follow St. Thomas most closely. We start with the maxim, explained above, that all natural knowledge originates in sense-perception. The

mind of the child is at first like a clean tablet, *tabula rasa*, on which nothing as yet has been written : it has no inborn ideas. Its avenues to knowledge are its senses. If these should be so clogged by disease as to be unfit for action, the intellectual powers will never be set to work ; in fact, we find that persons born deaf and blind are apt to remain idiotic. When the senses of any child first open to the outward world, it begins to have sense-perceptions, as brute animals have ; there is for a considerable time no sign of intellectual action. When the brain, the organ of the imagination, becomes sufficiently perfected to elaborate phantasms suitable for intellectual use, the intellect becomes aroused to its specific activity. It sets to work abstracting what is intelligible in the object, and forming an image of the object's nature. It impresses this abstract species upon the receptive intellect, which in turn seizes upon or expresses the image in itself, and thus intellectually apprehends or cognizes the object. For instance, the hand seizes an orange, the eye sees it, the palate tastes it, etc. ; the phantasms formed by the imagination represent all that is sensible in the fruit. The intellect goes deeper; it reads within the reality, as its Latin name signifies (*intus legere*, to read within) ; it abstracts and conceives the ideas of 'being,' 'substance,' 'accidents,' in particular of 'size,' 'taste,' 'smell,' 'color,' of 'cause,' 'effect,' 'food,' 'pleasure,' etc., etc. All the senses, interior and exterior, are constantly bringing new phantasms to the brain ; the intellect is constantly abstracting and comparing, conceiving and judging; inductive reasoning, now fairly aroused, contributes its share to develop knowledge ; and thus all our ideas are gradually formed, having a foundation in objects of sense-perception.

183. At first these ideas are not considered by us as representing whole classes of things : the ideas are **direct**, representing the notes 'being,' 'substance,' 'cause,' etc., which

exist identically in each individual object considered; but we do not yet reflect on the fact that the objects are generically or specifically identical. For instance, when I see a rock, a fruit, a man, etc., I apprehend each as a substance; this apprehension gives me the **direct universal** concept 'substance.' By observation I notice the identity of the objects; but it may be a long time before I reflect sufficiently upon my direct universal concepts to perceive distinctly that they are universal—*i. e.*, that they represent one thing common to a whole class of things. When I do so at last, I have a **reflex universal** idea.

184. Philosophers have warmly discussed the nature of reflex universals. The question is a radical one; errors on this subject strike at the root of all our knowledge. The **Nominalists**, such as Bain and J. S. Mill, maintain that universals are mere names assigned to a whole class of things, because we choose to fix our attention on some attributes which resemble each other in different objects; they do not suppose that anything is common to such objects, but only that we give the same name to things similarly marked. They would deny that there is anything identical in all men, in all substances, etc.; simply, we classify things by an arbitrary grouping, and we assign names to the groups. The **Conceptualists** admit more than identity in the name; but still, they admit nothing identical in the things—*e. g.*, in animals, in plants, etc. They admit similarities so close that we imagine them identical, and thus we conceive, say a lion, by a sort of vague or blurred phantasm, which will sufficiently represent any lion in general. This is not an idea at all, but merely a phantasm; besides, it is essentially relative, since the word *animal* will not call up the same phantasm in every mind; thus conceptualism has led to the modern theory of relativity of all human thought. "It is," remarks Rev. R. F. Clarke, S.J.,

"the central error of modern Logic, but it has a twin brother in Metaphysics no less subversive of truth. The radical and fundamental mistake of modern metaphysicians consists in the supposition that it is possible for two objects to resemble each other without having some *fundamentum in re*, something truly and really common to both of them in which this resemblance has its origin." (See *Amer. Cath. Quart. Review*, 1888, pp. 52, etc.)

185. **Thesis IX.** *The reflex universals are not mental images derived from universal objects physically existing, nor are they mere names, nor mere fictions of the mind; but they have a foundation in the reality of individual objects.*

First part. Not images of existing universal objects, as the exaggerated Realists maintain. *Proof.* Every object physically existing is a concrete and singular object, while universals are neither concrete nor singular. For instance, there is no concrete physically existing being which is a universal "body," a body that is neither large nor small nor middle-sized, neither white nor black, nor cold nor hot, etc. The universal has no definite accidents, but everything physically existing has definite accidents. Therefore there exist no physical universals.

Second part. Universals are not mere names, as the Nominalists pretend. *Proof.* A *mere* name, or oral term, has no mental term, or concept, corresponding to it; but universal names have each a concept corresponding to them and signified by them. If they had not, all the common nouns and the verbs of a language, and most other parts of speech, would be without any certain signification; for most words express universals, and the Nominalists suppose that universals are mere names to which no definite concepts correspond. But it is subversive of all certainty to maintain that nothing definite in meaning corresponds to most of the words of men.

Third part. Universals are not mere fictions of the mind, but they have a foundation in the reality of individual things. It is here maintained that universals express some one thing which is the same in many things; while the Conceptualists maintain that there is nothing the same, but only something similar, in all the individuals of a class.

Proof 1. Similarity is impossible without something that is one in the things similar. For similarity is, as Aristotle defines it, "unity in some quality"; things are similar inasmuch as, to a certain extent, they agree or are the same. Therefore, if all things of a class are said to be similar, they are really one to a certain extent; now, the universal signifies things by that in which they are the same—*e. g.*, animals, plants, etc.

Proof 2. If there were not some one thing common to all the individuals of a species, then the concept could not represent the nature of that species, but only something which is not the species, but is mistaken for it; and thus all our apprehensions of universals would be founded upon mistakes; all the words of a language would have a meaning, but a false meaning. Now, this leads to universal Scepticism. Therefore universals express some one thing which is found in all the individuals of a species or genus; therefore they have a foundation in the reality of individual things.

186. The now antiquated **mysticism**, taught formerly by Plato, consisted in a very peculiar theory on the origin of ideas. He supposed that the souls of men, before being united with their bodies, were in another state of existence in which they saw truths intuitively; afterwards, when united with their bodies, the souls retain the truths formerly perceived, but they are unconscious of their knowledge till sense-perception comes to awaken it anew. Plato could give no proof of his conjectures; his only reason for them was that he

could not in any other way account for the origin of our ideas.

187. **Ontologists** teach: 1. That the human soul has not in virtue of its own essence the power of knowing truth; 2. That this power must be supplied by a principle extrinsic to it; 3. That this extrinsic principle must be immediately present to the soul and directly intelligible, and must be of such a nature that in it all other things can be made intelligible to us; 4. That there can be no such being except God; 5. That our ideas, even our universal ideas, are not psychological, *i. e.*, formed by our souls, but ontological, *i. e.*, having objective existence, being the objects known to us. Still, many Ontologists allow that our mind can, by means of reflection, form to itself psychological ideas, which it can then compare with the ontological, thus knowing them to be conformable to the objective truth.

188. **Thesis X.** *Ontologism does not properly account for the origin of our ideas.*

Proof. That theory does not properly account for the origin of our ideas, 1. Which does not give a good explanation of known facts; 2. Which makes gratuitous and even false suppositions; 3. Which leads to false conclusions. But such is Ontologism.

1. *It fails to give a good explanation of known facts:* (*a*) It is a certain fact that our knowledge is intimately dependent on sense-perception; why is this so, if we see truth in God? (*b*) We know all things in connection with phantasms: bodily things by their own images, and things immaterial by reference to images borrowed from matter; why is this? The very terms applied to immaterial things are taken from material objects, *e. g.*, incomprehensible, immaterial; an acute, sharp, dull, clear intellect, etc. (*c*) We have no consciousness, even on reflection, that we see God; why is this, if we see Him?

2. *It makes gratuitous and even false suppositions:* (*a*) That actual finite beings are not cognoscible in themselves; why are they not cognoscible in themselves, if they have their own entity? (*b*) That we see things in God, and still we do not see God; why is this? (*c*) That we know God by species taken directly from Him, and other things by species taken from God; the opposite is evidently the case.

3. *It leads to false conclusions*; for, as entity and intelligibility are convertible terms, if finite things have not their own intelligibility, it will follow that they have not their own entity distinct from God's entity, that they are one with God; thus Pantheism is arrived at as a logical conclusion from Ontologism. In striving to refute this argument, Ontologists contradict and refute each other, and are divided into a number of schools: Malebranche claims that all things become intelligible to us by means of their archetypes, which we see in the Divine essence; Gioberti maintains that we do not behold the essence of God, but His creative act, *Ens creans existentias;* Rothenflue supposes that we see God "merely as being," *esse simpliciter*, etc. Therefore Ontologism does not explain the matter properly.

189. In connection with the study of ideas we must speak briefly of the expression of our ideas by words or **articulate language.** A word is an arbitrary articulate sign of an idea; therefore the same word has not the same meaning in different languages. Hence words cannot of their own force communicate our ideas to other men; but they are readily associated with ideas so as to become their inseparable companions. It would be incorrect to say that we cannot think without words: in fact, we often form ideas, judgments, trains of reasoning, and we experience feelings which we have no words to express, and deaf-mutes have no articulate signs at all. Still, thought without articulate language would be far less distinct,

more embarrassed in its process; and the minds of children would develop much more slowly and imperfectly if it were not for the use of speech.

190. As to the **origin of language**, it need not be to us a subject of vague speculation. We know from the historical account of Genesis that man had a language from the beginning, which he to a certain extent elaborated under the direction of the Creator (Gen. xix. 20); but he was then, before his fall, in a state of higher mental and bodily perfection than he is now. The question has often been discussed whether, with none but his present mental powers, man could have invented a language. No one doubts that it would have been difficult to do; it is even difficult now to make any decided improvement upon any nation's tongue. Still, there appears to be no conclusive reason to deny that it might, perhaps, have been gradually effected. To give a history of the supposed development of language, as Evolutionists sometimes attempt to do, is an idle task, always most unsatisfactory and never scientific.

CHAPTER III.

SENSIBLE AND RATIONAL APPETITE.

191. **Appetite,** in its widest sense, was, in the language of the Schoolmen, any tendency of a being towards a good suitable to its nature: (*a*) If the being does not apprehend the good to which its nature inclines it, its appetite was by them called *natural;* such is the tendency of a stone to fall down to the ground, of a plant to grow and produce fruit, the result being intended by the Creator. (*b*) If it apprehends the good by sense, the appetite is *sensible.* (*c*) If by reason, it is *rational* appetite or will. In English we never use the term *appetite* except for the tendency to sensible or to rational good.

192. The natural appetite of a being tends to what is essentially good for that being as a whole, and for the species; the **sensible and rational appetites** tend to the special good of sense and of reason; they are two distinct faculties, differing by their formal objects, viz., sensible and intellectual good.

193. An act is called **spontaneous** whenever the principle giving rise to it is in the agent; thus, all vital acts are spontaneous. In a stricter sense, however, only the acts of sensible appetite are called spontaneous; the acts of the rational appetite or will are termed **voluntary.** Now, voluntary is not the same as *free;* thus we voluntarily desire happiness, but we are not free to desire it or not.

194. **Freedom** is the absence of constraint. The absence of extrinsic constraint is *liberty from coercion;* even brutes may enjoy this. The absence of intrinsic constraint is

freedom from necessary action. This last is freedom or liberty properly so called: it enables our will to choose for itself between two alternatives; it is also styled *liberty of indifference.*

195. Sensible appetite as such, whether in man or brute, is not truly free; it is, indeed, free from extrinsic constraint, but not from intrinsic necessity. The reason is that its action is organic, the heart probably being its organ; and all organic action is subject to the physical laws of the material creation. When, therefore, an object is apprehended by sense as good, or delectable, or when the phantasm of such an object is aroused in the animal, the sensible appetite must, by a physical necessity, tend to that delectable good. Brutes, therefore, are entirely irresponsible for their appetites.

196. But man has an indirect power of controlling, to a certain extent, the workings of his sensible appetites; and he is in duty bound to regulate them by the law of reason. For good order requires that the superior faculty shall rule the inferior. Now, **man can indirectly control his animal appetites in various ways;** 1. He can avoid such external objects as would excite his appetites. 2. He can use in their stead objects that will affect him differently. 3. Even when he cannot change his material surroundings, he can recall phantasms of a different tendency. 4. He can withdraw his attention from any particular objects or phantasms. 5. He can often, by a powerful effort of his will, compel his sensible appetites to a reluctant obedience. 6. He can control his members so as not to yield obedience to his animal appetites.

197. The **essence of liberty** consists in this, that, when everything is ready for action, the will has still a choice of its own with regard to the action. Man can exercise that choice in various ways: he may choose to act or not to act,

to take one thing or its contrary, or to select between things not opposite to each other; technically he has liberty of *contradiction*, liberty of *contrariety*, and liberty of *specification*.

198. **Thesis XI.** *The will of man is free, not only from coercion, but also from necessary action.*

Explanation. We do not maintain that we are always free in every respect—for instance, we cannot help desiring our own happiness—but we are free with regard to particular means of seeking our happiness. The liberty of man is true liberty, in the meaning explained in the preceding paragraph.

Proof 1. We have a clear and invincible consciousness that we often will things when we could restrain ourselves from willing them, or could will something different or the contrary of them. We experience this consciousness: (*a*) Before we make our choice, when we notice that we could delay our choice and take longer time to consider, or act at once without further delay; even when we are going to act, we know that we can take one thing or another. (*b*) In the act of choosing we distinguish between necessity and free choice; when we choose freely, we are conscious that our decision is our own, of which we assume the responsibility, and that we could, if we would, choose differently. (*c*) After our choice, we are conscious that we have done morally well or ill, that we have reasons for self-reproach or for self-approbation. Now, consciousness is an infallible motive of certainty. (*Logic*, No. 116.)

Proof 2. We judge without any fear of error that others also are responsible for their choice. All men agree with these judgments—witness the laws, tribunals, histories, etc., of all nations.

Proof 3. When we submit one of our free acts to a scientific analysis, we understand that it must be free. For the will is presented by the intellect with the choice between

things which the intellect proposes as desirable in some respects and not desirable in other respects, and not necessary just now. Our intellect does not then compel the assent of the will to any particular choice; still, our choice is made; the reason, therefore, of the choice must be in the will itself.

199. **Objections:** 1. "The essence of that which is improperly called the free-will doctrine is that, occasionally at any rate, human volition is self-caused—that is to say, not caused at all" (Huxley, "Science and Morals"). *Answer.* We deny it. This is a play on the word *self-caused:* the act of volition is not caused by the act of volition, which it would be if it were self-caused; but the act of volition is caused by the faculty of the free will. It is true that matter cannot determine the nature of its action; but it does not follow that a spirit cannot do so. Rather, from the fact that matter cannot determine its action, and our soul can, it follows that our soul is not matter; to avoid granting this logical conclusion, Huxley finds it necessary to deny the liberty of the will.

2. Consciousness testifies to the existence of our acts, not to the manner nor the causes of our acts, therefore not to their liberty. *Answer.* Consciousness often testifies to the manner of the act as well. Besides, we are conscious of our acts by which we decide between different courses of conduct; *i. e.*, the direct object of our consciousness is the exercise of our liberty: we are conscious that we make a free choice.

3. We mistake spontaneous action for free action. *Answer.* We clearly distinguish between *free* and *not free;* thus, we do not call the pleasure free which we find in food, though our perceiving it is spontaneous.

4. We cannot help choosing what we like best; therefore we are not free. *Answer.* If this means that we cannot help preferring what we prefer, we cannot choose and yet not choose a thing, it is true, but not to the point. But if it means that we cannot help choosing that which holds out the stronger attraction, it is false; if it were true, no one would be accountable for his action, all mankind would be in error about moral good and evil, our own consciousness would deceive us, etc.
5. If we could choose what holds out the weaker attraction, that choice would be without a reason, but there is nothing without a reason for it; therefore we always choose what is more attractive. *Answer.* The reason for choosing what is less attractive is not that it is less attractive, but it is reason enough that it is attractive at all, and therefore capable of exciting our appetite.
6. Our will always obeys our last practical judgment; but our judgment is not free. *Answer.* Our judgment may be influenced by our free will, as when we make ourselves believe that a thing is right because we like it; in this case our judgment is free. But if the objection means that our will always obeys our last practical judgment, which is entirely independent of our will, the statement is false. We know that, when our intellect tells us we ought to do one thing, we can still do another; we can also choose what we judge to be less useful or less agreeable.
7. God knows what I shall do to-morrow; therefore I must do it. I am not free. *Answer.* God knows it, because I will freely do it: knowledge is by nature consequent on the fact known and does not in the least influence the fact.

8. Statistics show that the same average of crimes occurs each year, therefore such things obey a necessary law. *Answer.* Statistics may show some remote proportion between temptation and crime; but no more than can be explained by the fact that men, even though free in any single case, are more inclined habitually one way than another, and that there is a certain uniformity in the circumstances which tempt men to the commission of crimes.

CHAPTER IV.

THE NATURE OF THE HUMAN SOUL.

200. **Thesis XII.** *The soul of man is essentially a simple being.*

Proof. Our soul takes in simple ideas; for instance, those of truth, holiness, justice, infinity, being, etc.; but a principle that can take in or conceive a simple idea is simple. For if it were composed of parts, then either, 1, *Each part would take in the whole idea;* each part would be a soul, and every man would be not *I* but *we*, which is against the testimony of consciousness and of common sense; or, 2, *Each part would take in a part of a simple idea;* but a simple idea is not an aggregate of parts; or, 3, *Only one part would take in the whole idea*, the other parts not apprehending it; then the part apprehending the simple idea would be the soul. If this part is simple, the soul is simple, as we maintain it is. But if that part is itself compound, the same reasoning must again be applied to it; and the absurdities arising cannot be avoided except by granting that the principle which conceives simple ideas is simple, or that the soul is simple.

201. **Objections:** 1. A simple soul is unthinkable, *i. e.*, cannot be thought of, says Huxley. *Answer.* It is unimaginable, not unthinkable; if we could not think of it, we could not point out the essential notes by which it is distinguished from all other beings.

2. Our intellect is affected by our bodily ailments; it may be disorganized, deranged, enfeebled, excited, etc.;

therefore it consists of parts. *Answer.* The intellect itself cannot be deranged, but its co-natural objects are presented to it by the phantasms of our imagination. Now, our imagination can be deranged, for it is an organic power; and in reality all mental derangement, enfeeblement, excitement, etc., can be traced to affections of the imagination.

3. Phrenology shows that all action of the soul is modified according to the modifications of the brain; therefore the soul is identified with the brain. *Answer.* Phrenology is not founded upon certain principles; therefore it is not a science and cannot draw scientific conclusions. Elevations in the brain do not always correspond to elevations in the cranium, nor do mental dispositions always correspond to special modifications of the brain. Even if they did, it would only prove that the action of the soul is modified when its organ is affected; for the brain is the organ of the imagination; and the imagination exerts an extrinsic influence on the understanding, presenting to it the images that assist thought.

202. **Thesis XIII.** *The soul of man is spiritual.*

Explanation. Spirituality expresses more than simplicity; every spirit is simple, but a thing may be simple without being spiritual; such is the soul of the brute. (See No. 145.) A being is spiritual when it can act and exist without material organs.

Proof 1. The soul will actually survive the body, as will be proved further on (Nos. 213, 214); this supposes that it can exist and act without the body; therefore, that it is spiritual.

Proof 2. The soul, even now, performs acts in which matter cannot have an *intrinsic* share; for instance, when we conceive such ideas as virtue, holy, honest, will, intellect, God, angel,

spirit, etc.; also when we love spiritual good, which cannot affect any organism. In fact, all abstract, all universal ideas are beyond the reach of matter; for matter being essentially concrete and singular cannot represent any but concrete and singular objects. Likewise all judgments, reasonings, volitions, every act that is distinctively intellectual, is inorganic in its essence; the imagination does furnish it with materials extrinsically, but cannot enter into its specific action. Now, it is evident that a being acts according to its nature; therefore the nature of the intellect is spiritual, distinct from matter, independent of matter in its own specific sphere of activity; therefore intrinsically capable of acting and existing without a body. The argument may be stated thus: An organic faculty—*i. e.*, a faculty which has matter as a con-cause of its operations—can only perceive such objects as can make a material impression upon it; but our intellect perceives objects which cannot make a material impression upon it; therefore our intellect is not an organic but a spiritual faculty. But a faculty is necessarily proportioned to the subject in which it resides; therefore the soul is spiritual.

Proof 3. No being can tend to a good which is above its nature; but the soul tends to spiritual goods, essentially above all material natures; therefore its nature is spiritual.

Proof 4. Matter cannot act freely, as materialists grant; but our soul acts freely, as proved above (No. 198); therefore our soul is not matter.

Proof 5. Our soul is conscious of its own acts; but consciousness supposes inorganic action and inorganic being. For an organ cannot inspect itself, a being dependent intrinsically on matter cannot double itself back on its own acts; therefore the acts of consciousness and the nature of a conscious soul are spiritual.

203. **Objections:** 1. All intellectual action begins in

sense, therefore the soul is dependent on the body for all its acts. *Answer.* The soul is, in our present state of existence, extrinsically dependent on the body in more than one way. viz.: for its communication with the visible world, for its phantasms, and for the exercise of its faculties generally; but since matter does not intrinsically co-operate in its intellectual acts, there is nothing impossible in the separate existence and action of the soul, without the extrinsic aid of the body.

2. The soul is the form of the body; therefore its very being is the being of the body. *Answer.* Though it makes one being with the body, still its being is not exhausted by the being of the body; in other words, it is the form of the body, but it is not only the form of the body; it is more.

3. Whether the aid of organs in the acts of the intellect be called intrinsic or extrinsic, it is necessary for intellectual action; therefore the soul cannot act without the body. *Answer.* The aid of phantasms is now necessary, because every being acts dependently on the circumstances in which it is placed; thus, when we are in a room, we depend on the window to see objects outside. The soul, therefore, being at present one being with its body, must now act in union with that body, using the aid of that body as far as it can aid the act of intelligence. Therefore we now think of all things in connection with phantasms. When, however, the body will be no more one with the soul, the latter can retain all its intellectual species formerly acquired; it can know its own essence directly, and, by reasoning on all this, know its Creator; besides, it can receive divinely infused knowledge, and knowl-

edge communicated to it by other intelligences in manners suitable to its new condition.

204. **Thesis XIV.** *The intellectual soul is the only principle of life in man, and is therefore the form of the human body.*

Explanation. It was proved above (Thesis V.) that the vital principle of any living body is truly the form of that body; if, then, we prove here that the intellectual soul is the only vital principle in man, we thereby establish the fact that the soul is the form of the body. Now, the intellectual soul is really the only vital principle in man.

Proof 1. Every man is conscious of being a unit, which he signifies by the term 'I'; he is conscious, moreover, that the same 'I' feels, and thinks, and wills. Now, if there were more than one vital principle in man, the intellectual soul could not be conscious of all this; for vital principles perform immanent actions, and one principle cannot be conscious to itself of performing the immanent act of another principle, conscious of doing what it does not do.

Proof 2. The more the intellect works, the more the inferior vitality of a man is relaxed; on the other hand, when the lower functions of life are most energetically exercised, the mind is less fit for its own activity. Thus, while wrapped in deep thought, a man scarcely sees or hears; he digests imperfectly. Now, all this cannot be explained except by supposing that the same principle performs the higher and the lower functions of human life.

Proof 3. Anatomy shows that the entire organism of the human body is one unit, combining the organs of vegetable and animal action into one harmonious whole.

205. **Corollaries.** 1. The soul is in every part of the body, acting in every organ with a vitality appropriate to such organ; seeing in the eye, hearing in the ear,

breathing in the lungs, digesting in the stomach, moving in the muscles, etc.

2. All organic action in man is the action of the compound soul and body; for matter can do nothing except in virtue of its form.

3. The soul is directly united with the prime matter or potential principle, being itself the active principle: it gives to the body all its powers and its very nature of a body, and such a body. Still, when the soul departs at death, the body cannot cease to be a body of some kind; for the potential principle of matter cannot exist without a form. Whether this new form be one form for the whole corpse, a form supplied for the purpose by the laws of nature, or whether the flesh, bone, sinew, etc., have each its own form, existing before death under the control of the life principle and now acting independently, matters very little. (Pesch, *Inst. Phil. Nat.*, No. 210.)

206. Those who do not understand the Peripatetic system of matter and form are greatly embarrassed to explain **how body and soul act on each other.** Various theories have been imagined, all of them unscientific. Plato supposed that the soul is *seated in the brain*, whence it rules the body as the rider does his horse. The *assistance* theory of Descartes maintains that soul and body do not act on each other, but God acts on either one of them whenever a modification occurs in the other. Leibnitz's theory of *pre-established harmony* teaches that God, foreseeing all that any soul would do in the course of life, has in his wisdom given to each soul a body so constructed that it will automatically act just when and as the soul wills, though the soul does not influence it in the least. The theory of *physical influence* makes the soul and the body act on each other as two distinct beings.

Günther imagined a principle of animal life, called by him *psyche*, which he supposed to be substantially united with the intellectual soul. No system can be scientific which makes man to be, not one but two beings, each having its own activity; the only theory in harmony with man's essential unity is that which views the soul as the form of the body. The form is not acted upon by the body, nor does it act on the body; but it is itself the active principle of the body. Thus, the soul is not acted upon by the eye or the ear, but the living eye, the living ear acts, perceiving color and sound. The whole question about the interaction of body and soul thus ceases to be a question at all; for there can be no interaction where there are not two agents each having its own action, but the action is common to both.

CHAPTER V.

ORIGIN AND DESTINY OF THE HUMAN SOUL.

207. Many ancient philosophers, finding the soul of man so evidently and immeasurably elevated above the entire material creation, erroneously conjectured that it, in some way or other, must have **emanated** from the very substance of the Divinity. To-day a very different error has not a few advocates among the votaries of the physical sciences: they imagine that man may be a mere **evolution** of the brute, and the highest step in a universal movement of evolution.

208. The most popular shape in which this vagary has found favor with the modern public is the **Darwinian theory,** which may be stated thus: All plants and animals, man included, are evolved from inferior species, and, as many of Darwin's disciples add, ultimately from unorganized matter, by means of *natural selection.* The process of natural selection is as follows: All plants and animals tend to increase their numbers in a geometrical progression; hence arises a severe *struggle for existence,* in which contest nature causes the weakest individuals and species to perish, and the best-constructed to multiply, thus producing the *survival of the fittest.* Consequently, organic life must ever be ascending in perfection, and lower species have thus been developed into higher species. (See Mivart's *Genesis of Species,* pp. 17, 18.) This theory is interesting and ingenious; but its disastrous consequences to morality, to religion, to social life, and to individual happiness for time and eternity are so obvious, that noth-

ing but the most convincing evidence of its truth could possibly excuse those who love to disseminate its noxious principles.

209. And yet the Darwinian theory, far from being established beyond a doubt, is totally devoid of demonstration, and is **a mere figment of the intellect.** Charles Elam, M.D., after an accurate analysis of facts in three articles of the *Contemporary Review*, continues thus (Dec., 1876, p. 132): "The conclusions which necessarily follow from the foregoing observations may be briefly summed up in one syllogism, embracing not only Natural Selection, but also the larger theme of Organic Evolution generally:

"'Without verification a theoretic conception is a mere figment of the intellect' (Tyndall's *Fragments of Science*, p. 469).

"But the theory of Organic Evolution is an unverified conception.

"Therefore Organic Evolution is a mere figment of the intellect."

To prove the minor, we may quote the rule laid down by Huxley, that the only way in which any hypothesis of progressive modification can be demonstrated is "by observation and experience upon the existing forms of life." Now, he grants in the same paragraph that the Darwinian hypothesis has not yet received such demonstration. (*Lay Sermons*, p. 226. See further Mazzella's *De Deo Creante*, Disput. iii. art. i. § 3.)

210. We have proved above (Thesis VIII.) that the species of plants and animals are fixed, incapable of transformation. With regard to the evolution of man, in particular from a lower animal species, and of the intellectual from the sensitive soul—the main point with which we are here concerned—we add the following:

Thesis XV. *The gulf between brute and man is absolutely impassable by any process of evolution.*

Proof. The brute animal is entirely material: though it is animated by a simple soul, still that soul is only the substantial form of the body, the principle of bodily action and nothing more; it can neither exist nor act except in matter, so that all its life, all its activity consists in material modifications of a material organism. This much is admitted by modern philosophers and scientists generally, as well as by the Schoolmen. Now, what is merely material can never be developed, whether by the Darwinian process or by any system of evolution, into a spiritual being; or, which is the same thing, matter cannot possibly be evolved into a thinking, a reasoning being. For all evolution is merely a modification of matter; but matter in all its modifications remains matter; therefore evolution of matter cannot produce anything but matter. Now, matter cannot possibly reason; for reasoning implies universal ideas, since at least its middle term must be distributed (*Logic*, No. 32); and matter cannot conceive a universal idea. For an idea is an image of the object, and every image in matter can only be a concrete image of a concrete and singular thing; while a universal idea is an abstract image of what is neither concrete nor singular, and therefore cannot possibly be imaged in matter. Therefore matter can never become capable of reasoning. But our soul reasons; hence a material being can never be evolved into the human soul; or, the gulf between brute and man is absolutely impassable by any process of evolution.

As a fact, evolutionists find it impossible to account, in their theories, for the spirituality of the human soul; hence they either deny this spirituality, believe in nothing but matter, and become Materialists; or they refuse to draw the logical conclusions which flow from their false principles, and, to veil their inconsistency, they assume the sceptical position of Agnostics.

211. **Thesis XVI.** *The soul of man cannot originate except by creation*, i. e., *by being made out of nothing.*

Proof. If it were made out of anything, this would be material or spiritual. It can be neither: 1. *Not material;* for, as we have just proved, no change in matter can fit it for the acts of thinking. 2. *Not spiritual;* for it cannot be made out of a part of that spirit, since a spirit has no parts: nor out of the whole of that spirit, which would then cease to be when the soul begins to be. Among all the wanderings of genius, no philosopher has ever maintained that the soul is made out of a previous spirit which then ceases to exist. The human soul, therefore, cannot be made out of another being; hence it is created, made out of nothing.

212. As to the question **when the souls of men are created,** Plato supposed that all human souls lived before in the stars, whence they were banished for crime; others have taught the transmigration of souls from one body into another, even into brutes, as a punishment for their moral degradation; Leibnitz and Wolf pretended that all human souls were created in the beginning of the world, but remained without intelligence till united to their destined human bodies. All such theories are destitute of proof and even of plausibility. Why should a soul exist before it can do work suited to its nature? **The scientific answer** is that which is derived by careful reasoning from known facts. The soul of each man must begin to exist when its work begins. Before biology became a science, it was supposed that the human soul was not created till the body was sufficiently organized—first by a previous vegetative, and next by a merely animal soul—to become the fit organism of that higher principle which was to build it up into a distinctively human body. That principle was the intellectual soul. At present it is far more probable that the rational soul is created, and made the substantial form of the

body, from the very moment of conception: the infant of a day has already an immortal soul; hence the wilful destruction of its life is murder.

213. **Thesis XVII.** *The human soul does not perish with the body.*

Proof 1. This is one of the most universal judgments of common sense.

Proof 2. The justice and the wisdom of God require that there shall be a sufficient sanction for the moral law—*i. e.*, that there shall be such rewards for virtue and punishments for vice as shall make the good ultimately much happier than the wicked. But such a sanction does not exist in this world, where the virtuous are often oppressed, despised, persecuted unto death; therefore it must exist in a future life.

214. **Thesis XVIII.** *The human soul is immortal.*

Proof 1. The Creator has given us a longing for a never-ending existence, an endless happiness; but He could not have done so if our souls were not really destined for an endless life. For it would be unworthy of His goodness to give us a longing after a great good, which we could not possibly attain; and it would conflict with His truthfulness to give us, in such natural desires, an implicit promise of immortality, if He did not enable us to attain it.

Proof 2. A spiritual being is capable of acting and existing for ever; in fact, immortality is natural to it, because, having no parts, it cannot be dissolved or corrupted as to its substance. Therefore it is natural for it to exist till it be annihilated by its Maker. But the Creator can have no reason to annihilate it, as long as it can answer the purpose of its existence; now, it can answer that purpose for ever, by showing forth the justice, the power, and the goodness of God, and thus contributing to His external glory. God makes nothing useless; but the natural indestructibility of the soul

would be useless if God should annihilate it, no matter after how long a period.

215. Can we prove that **the souls of the wicked shall suffer for ever,** that the pains of the lost are eternal? We can certainly prove by reason: 1. That it is natural for all spirits to exist for ever; 2. That God is not bound to destroy those who He intended should glorify Him throughout eternity; 3. That a being which freely fails to attain its destined happiness must naturally expect to be disappointed for ever, and can only blame itself for its unhappiness; 4. That God is not bound to give new chances to a free creature which has with full deliberation rejected His sincere offers of beatitude; 5. That it is proper for every immortal being not to be in a provisionary state for ever, but to come sooner or later to a definite and final condition, and to remain in the same for eternity; 6. That there would be no complete sanction of the moral order, if the punishment of such as will persevere in their wickedness till the end would not last for ever; 7. That no motive but the dread of eternal punishment is under all circumstances sufficient to restrain man's passions. Hence it is abundantly proved that reason itself appears to demand eternal punishment for those who die in a state of rebellion against their Maker.

216. Those who deny the spirituality and, consequently, the immortality of the soul are called *Materialists*, since they admit nothing but matter in the world. Many recent writers, anxious to disclaim this odious title, have invented the less unpopular appellation of **Agnostics.** "I called myself an Agnostic," writes Huxley. "Surely no denomination could be more modest and appropriate" (*Lay Sermons*, p. 294). These strive to evade the arguments of all sound philosophers by pretending that such questions as concern the existence of God, the nature of the soul, its future destiny, etc.,

are too deep for our investigations. Still, while pretending to keep aloof from such matters, they are constantly alluding to them, arguing against the great truths of philosophy in a covert manner. They do not prove their thesis, but they take it for granted, calling God the Unknown, as if no man knew anything about the necessity and the greatness of the Creator, sneering at the spirituality of the soul, as if it were a self-contradiction, etc., etc.

217. **Thesis XIX.** *Agnosticism is destructive of all sound Philosophy.*

Proof. That system is destructive of Philosophy which renders all the most important inquiries impossible: in particular, which denies that we can know anything certain about the existence of the soul as distinct from the body, of a future state, of a wise and personal God, the rewarder of good and evil; and which, consequently, makes it doubtful whether there is anything worth living for beyond the gratification of the passions. For Huxley himself admits that "The question of questions for mankind, the problem which underlies all others, and is more deeply interesting than any other, is the ascertainment of the place man occupies in nature, and of his relation to the universe of things. Whence our race has come, . . . to what goal we are tending, are the problems which present themselves anew, and with undiminished interest, to every man born into this world" (*Man's Place in Nature*, p. 57).

Now, Agnosticism renders all such inquiries futile and such questions incapable of satisfactory settlement. The same writer acknowledges this: "Why trouble ourselves about matters of which, however important they may be, we do know nothing and we can know nothing?" (*Lay Sermons*, p. 145).

The Mental Philosophy of the Schoolmen, so far briefly

outlined, answers all these questions clearly and without hesitation. Its voice comes to us from the most distant past, strengthened by the approving accents of all intervening generations.

The advancement of true science, so far from having weakened its teaching, has strikingly confirmed, and daily confirms more and more, the truth of its doctrines. It alone satisfies the reason and the heart of man.

BOOK IV.

NATURAL THEOLOGY.

218. **Natural Theology** is our study of God by the light of reason, without the direct influence of supernatural Revelation. We exclude the direct, but not the indirect, guidance of Revelation; for no earnest investigator of truth will close his eyes to the bright light of Divine teaching, and prefer to grope his way by the faint glimmer of unaided reason. We live in the full blaze of Christian civilization, which it were folly to ignore. We set out, therefore, in the pursuit of wisdom, not as pagan sceptics in quest of the unknown cause of this world, if perhaps there be such a cause, but as enlightened Christians, who wish reverently to investigate what our reason can understand about a matter so far above us, viz.: the nature and the perfections of the Creator, and the relations in which He stands to His creatures.

We shall consider: 1. The existence of God. 2. His essence. 3. His quiescent attributes. 4. His operative attributes.

CHAPTER I.

THE EXISTENCE OF GOD.

219. We shall begin by considering God as He is most obviously conceived by man, viz., *as the first and intelligent Cause of the universe, and the Supreme Lord to whom we are all responsible for our moral conduct.* Those who refuse to acknowledge the existence of God are called **Atheists**: *practical* Atheists deny Him by their conduct, and *theoretical* Atheists in their speculations. Unfortunately there have been many practical Atheists; but those of the theoretic kind have been comparatively few, and none of them conspicuous for virtue. The **Agnostics** are a very recent school of physical scientists, rather than of intellectual philosophers, who do not deny that God exists, but pretend that His existence cannot be validly demonstrated.

We are to prove in this chapter that the existence of God, such as He is most obviously conceived by man, is absolutely certain. Various proofs may be given; we select the following, which we present in bare outline:

220. **Thesis I.** *The existence of God can be demonstrated by metaphysical, physical, and moral arguments.*

Proof 1. The **metaphysical argument** considers God as the first efficient cause of this world; it may be thus proposed: the world is a system of contingent beings; but no contingent being can exist without a necessary being which is its first efficient cause; therefore a necessary being exists which is the first efficient cause of the world.

We prove the major: A contingent being is one that may exist or not exist as far as its own nature is concerned—in other words, a being that is not self-existent. But the world is not self-existent, as was proved in *Cosmology* (No. 103). Therefore the world is a contingent being.

We prove the minor: There can be nothing without a sufficient reason; hence a contingent being must have a reason for its existence. But that reason is not in the contingent being itself; therefore it must be in another being. This is its cause; for a cause is a being that influences the existence of another being. Now, if that cause is a necessary being, then our proposition is proved; if it be not a necessary being, then it is contingent, and therefore must have a cause, as we have just proved. Thus we must go on reasoning, till we come to a first cause which is not contingent but necessary; or we must suppose that there has been an infinite series of contingent causes without any necessary cause. But besides the fact that such a series is absurd (because an infinite series in the past could never have come to a particular effect, since the infinite can never be passed through or left behind), even if it were not absurd, it would be inadequate to produce such an effect. For a multitude of contingent beings without a necessary cause could not have a sufficient reason for existence; since contingency is the want of an intrinsic reason for existence. Therefore no contingent being can exist unless there exists a necessary being which is its first cause.

221. *Proof* 2. **The physical argument**, supposing it proved that the world is contingent (No. 103), views God as its intelligent cause, and proves His existence from the physical order conspicuous in the world; it is this: There exists in the world a most wonderful order, or adaptation of means to ends: (*a*) to particular ends, as of the eyes to see, of the ears to hear, of the tongue to suit various purposes, etc.;

(*b*) of all the parts to a common end, viz., to the preservation of the whole. Now, such adaptation, visible in the world, requires intelligence in its cause, and even an amount of intelligence proportionate to the vastness, the variety, and the perfection of the order produced; therefore the first Cause of the world must be intelligent beyond all our conception.

The *minor*, viz.: order in the effect requires intelligence in the cause: (*a*) It is analytically certain; for a disposing of means for an end implies the intellectual perception of the relation existing between means and end, and therefore it requires intellect in the cause. (*b*) It is attested by the common consent of mankind; for no one could believe, *e. g.*, that letters or type put down at random would produce a grand poem. (*c*) It is always insisted on as a certain truth, even by the Agnostics in their scientific researches; for, when they find any fossil which has a regular shape or mark, they claim it as an undoubted proof of human, *i. e.*, intelligent, workmanship. Therefore order in the effect supposes intelligence in the cause.

222. *Proof* 3. **The moral argument** proves that there is a supreme Lord to whom all men are responsible for their moral conduct. It is as follows: All men when in the full possession of reason, in any part of the world, in all stages of society, among all races, even among newly discovered tribes, agree in the firm conviction, which acts as a constant check on their passions, that there exists a supreme Lord and Master to whom they are responsible for their moral conduct. Now, this firm and universal judgment cannot be erroneous; else it would show that it is natural for man to judge falsely, and the human intellect, instead of being the faculty of knowing truth, would be the source of a universal deception.

223. **Objections: I. Against the metaphysical argument.**

1. This argument is too abstruse to be reliable. *Answer.* It is, on the contrary, an obvious application of the analytical and common-sense principle of causality: everybody judges as readily that the world must have had a first cause as that a house must have had a builder.
2. Science must confine itself to the tracing of physical effects to physical causes. *Answer.* Physical science may do so, but philosophy must investigate the highest causes.
3. Evolution can account for all things physical. *Answer.* Evolution does not even touch upon the real origin of the world, but only on its development; even if the theory of evolution were true, there would still have to be a Creator of matter before that matter could begin to change its forms.
4. A self-evolving world might be a necessary being. *Answer.* Impossible. The series of evolutions must have had a beginning, a first stage; if that stage were necessary, then it could not change; besides, the world is proved in *Cosmology* (Thesis I.) not to be self-existent.
5. Although every single being in the world were contingent, the whole collection might be necessary. *Answer.* There can be nothing in the collection which is not supplied by the parts, especially when it is essentially excluded from the parts. Besides, the collection is both finite and mutable, and a necessary being is not such. (No. 103.)
6. From the existence of a contingent being we cannot conclude to that of a necessary being; for we should thus have more in the conclusion than in the premises,

viz., the necessary in the conclusion and only the contingent in the premises. *Answer.* We have the necessary being in the premises; for we have in the major that everything existing must have a sufficient reason, and in the minor that only a necessary being can truly be the ultimately sufficient reason of contingent beings.

7. There is no proportion between a contingent and a necessary being. *Answer.* There is no proportion of entity, but one of necessary dependence.

224. **Objections: II. Against the physical argument.**

1. Not every thing in this world exhibits the disposition of means to an end. *Answer.* It is enough for our argument that many things do.
2. But many things are evidently out of order; therefore it is clear that the Creator is not very wise. *Answer.* More than enough order is conspicuous in the universe to prove the Creator immensely wise, beyond all our conception. Besides, it cannot be proved that anything is out of order: a thing may not be arranged in the way that we might prefer; and yet it may, for all we know, be excellently arranged. Similarly, an ignorant man may not see the use of all the tools found in an artist's studio, but it would be foolish for him to say that they were useless.
3. But a world created by an infinitely wise and good God should be perfect. *Answer.* It should be relatively but not absolutely perfect. (No. 117.)
4. But the order of the world proceeds from the physical laws, and these result from the natures of the bodies; thus there is no need of an intelligent Ordainer. *Answer.* The natures of bodies proceed from the Maker of them: if they are well suited to

their ends, it is because the Creator has so suited them.

5. All the order of nature may be a mere accident. *Answer.* This would mean, in other words, that the most wonderful effect may be without a sufficient cause; for blind chance is not a sufficient cause of order.

6. The order of nature results from evolution by means of natural selection, the survival of the fittest, etc. *Answer.* If it were true that such evolution had taken place, it would only make the order displayed in the world more admirable; for he who would make a machine of such a nature that it should evolve a number of other machines in wonderful variety, and in an ever-increasing perfection of details, would thereby exhibit far more intelligence than if he were to make all these machines separately. Therefore this objection, whether true or false, is not against our thesis.

7. An adaptation of means to an end does not require intelligence; *e. g.*, the bee without intelligence builds its honey-comb most symmetrically. *Answer.* The bee and all brute animals, in following irresistibly the promptings of their instincts, display the wisdom of their Maker, just as a machine displays the skill of the inventor.

225. **Objections: III. Against the moral argument.**

1. Our judgments concerning our moral duties and responsibilities are due to education. *Answer.* They may be developed and perfected by education; but they are so essential to man that they are known even without education and amid all varieties of education.

2. This sense of responsibility comes from some passion or other, *e. g.*, from an idle fear of punishment. *Answer.*

The passions would rather prompt a man to throw off restraint, to do what he likes, while it is our moral judgment that is a constant check upon our passions. As to the fear of punishment, it is a consequence, not a cause of our sense of responsibility.

3. The sense of responsibility simply results from the intellectual apprehension of right and wrong. *Answer.* It also implies the judgment that there is a law obliging us to do the right and avoid the wrong, and that there is a Law-giver who enforces this law, for there can be no law without a law-giver.

4. There have always been atheists; therefore the judgments in question are not universal nor essential to man. *Answer.* We grant that there have been in many ages practical atheists; there have also been a comparatively small number of theoretical atheists, who maintained for a portion of their lives that there is no God. Some of these may, perhaps, have convinced themselves, or may have been convinced by others, that the existence of God was doubtful; but history does not tell of any sensible and sincere man who felt an habitual conviction through life that he was not responsible for his moral conduct to a supreme Being.

5. We find learned men who are really convinced that man is only matter, and therefore irresponsible for his acts. *Answer.* From the fact that such men as Pyrrho, Hume, Fichte, Berkeley, etc., argued against the certain existence of bodies, it does not follow that they firmly believed in their own theories; so, likewise, it does not follow from all the theorizing of materialists that they *bona fide* consider themselves as irresponsible heaps of matter, unless it be that abnormal

surroundings, or abnormal conditions of mind or heart, have extinguished in them the ordinary light of conscience. We do not know whether such a case is possible; but if it be, it is not from abnormal states that the judgments of man's common sense can be gathered.

226. Some pretend to prove the existence of God *a priori.* Now, to reason *a priori* means to reason from a cause to an effect; and as God has no cause, His existence cannot possibly be proved by such a process. But such theorists confound an *a priori argument* with an *a priori judgment;* they really mean that the judgment 'God exists' is *a priori*, or analytical. This is called the **ontological argument,** because it pretends to prove the existence from the very essence of God. This argument is specious but fallacious, and the more to be reprobated because the matter is so important. For those who see through the fallacy may be led to suspect that the existence of God is incapable of solid proof.

227. The ontological argument has been **variously proposed** by well-meaning men, such as Descartes, Leibnitz, and even by St. Anselm; it always comes to this: "God is the infinitely perfect Being; but the infinitely perfect Being exists, else He would not be infinitely perfect; therefore God exists." The middle term 'infinitely perfect Being' is ambiguous; in the major it is taken *abstractedly—i. e.*, it is a mere definition of the abstract term 'God'; the existence is not meant to be asserted even implicitly, but only referred to conditionally, *i. e.*, if He exists. In the minor the same middle term is used with a new meaning, *i. e.*, **concretely** and, as including existence, unconditionally. It is a trick of logic, which may escape the detection of many, but it is nevertheless a sophism.

It is true that the existence of God is immediately know-

able in itself; it is even the first truth in the *ontological* order; but it is not immediately known to us, *i. e.*, in the *logical* order, but it becomes known to us by means of an obvious process of reasoning *a posteriori—i. e.*, from the effects to the first Cause.

CHAPTER II.

THE ESSENCE OF GOD.

228. The **essence of a thing** is that which constitutes it intrinsically, making it what it is; it is the note or notes without which a thing can neither exist nor be conceived.

We shall consider in this chapter: 1. The difference between the physical and metaphysical essence of God. 2. The infinite perfection of His physical essence. 3. The simplicity of His physical essence.

ARTICLE I. PHYSICAL AND METAPHYSICAL ESSENCE OF GOD.

229. **The physical essence** is the essence viewed exactly as it is in the being itself, not introducing into it such distinctions as do not belong to it in the objective reality. Now, there are no real distinctions in the essence of God, as we shall show further on; therefore His physical essence is simply the sum total of His perfection.

230. But **the metaphysical or notional essence** of a being is its essence as conceived by us, *i. e.*, as it is traced out by our mind, and marked out in different perfections with logical distinctions, which are not objectively real, though they have a foundation in the reality. The metaphysical essence is viewed as distinguished from the attributes, and, in a created being, as distinguished from the accidents. In God there are no accidents; for He necessarily is all that He is. Now,

the essence as distinct from the attributes is conceived as, (*a*) so proper to a being as to distinguish it from every other being, and (*b*) so primary that all the attributes flow from it.

231. **The metaphysical essence of God**, therefore, must be that perfection in God which is conceived by our finite intellect as, (*a*) so peculiar to God that it distinguishes Him from all other beings, and (*b*) so primary or principal that all His other perfections flow from it. Now, this perfection seems to be *self-existence*; for (*a*) it distinguishes God from all other beings, since a self-existent being can be proved to be necessary, independent, infinite—in a word, to be God; and (*b*) it is primary in Him, since from it all His other perfections flow and can be logically proved.

232. We have said that **God's physical essence** is the sum total of His perfection; and we shall now proceed to prove two theses with regard to it: 1. That God contains all possible perfections in an infinite degree. 2. That there is no real distinction of any kind between those perfections.

233. **Thesis II.** *God is infinitely perfect.*

Explanation. We mean by a *perfection* any real entity, anything which it is better to have than not to have. A being is infinitely perfect when it has all possible entity in the highest possible degree. It is clear at once that God, being the cause of the world, must have all the perfections that are actually in the world; for there can be no perfection in the effect which is not in the cause. But besides, He must have, we maintain, all perfections that are intrinsically possible, *i. e.*, all that imply no contradiction. We must, however, distinguish between *pure* perfections—*i. e.*, such as imply no imperfection, *e. g.*, knowledge, goodness, justice, power, etc.; and *mixed* perfections—*i. e.*, such as imply some imperfection, *e. g.*, reasoning, which implies that some truth was first unknown. Now, we mean that God has all pure perfections *formally* or

as such, and the mixed He possesses *eminently*, *i. e.*, in a better way, without any imperfections.

Proof. Whatever the necessary Being is, it is that necessarily; but God is the necessary Being; therefore, whatever He is, He is that necessarily. Therefore, if there is any limit to His perfection, that limit is necessary; *i. e.*, further perfection is excluded by the very nature of His physical essence; in other words, the entity or perfection of His being would exclude some further perfection. But no perfection excludes other perfection, or is incompatible with further perfection; there can be no contradiction between good and good, entity and entity, but only between good and not good, entity and non-entity, perfection and imperfection. Therefore no perfection can exclude any other perfection; hence no perfection is excluded either in kind or in degree; therefore God is infinitely perfect.

234. **Objections:** 1. Our finite intellect cannot know the nature of the infinite Being. *Answer.* We cannot know the nature of the infinite Being adequately, but we can know many things about it; for they are applications of first principles—*e. g.*, that there can be no effect without a cause, that no effect can be greater than the cause, that entity or good as such is not opposed to entity, but to non-entity, etc.

2. The Holy Scriptures warn man not to search into things too high for him: "He that is a searcher of majesty shall be overwhelmed by glory" (Proverbs xxv. 27). *Answer.* It is not too high, but most appropriate for man to know his Creator, that he may reverence Him as he ought: "For the invisible things of God from the creation of the world are clearly seen, being understood by the things that are made: His eternal power also and divinity; so that they

(the ungodly) are inexcusable" (Rom. i. 20). But we are warned not to criticise the ways of God when they surpass our understanding: it is unreasonable for creatures to require of the Creator that He shall render them an account of His government of the world.

3. We ought not to ascribe human perfections to God; else we make Him an anthropomorphic God. *Answer.* Since all creation is some representation of God's perfections, there must be an analogy between the perfections of creatures and the perfections of God; but there is only an analogy. Human perfections are not predicated of God univocally, but always with a difference; and thus God is not made an anthropomorphic or human God. Our view of God is true as far as it goes, but it does not do full justice to God; thus, we say that a picture is a true representation of a statue, though it is unlike the statue in certain respects.

4. It is better, with Agnostics, to call God the great Unknown than to represent Him inadequately. *Answer.* This plea is not even plausible, though it is one of the most specious pretexts of modern infidelity. Inadequate knowledge, acknowledged to be inadequate, is better than total ignorance of any great truth—it is true as far as it goes; but to call *Him* unknown of whom we know so much is a violation of truth, a negation of what we know. Besides, it is most unjust, since it deprives the Creator of the honor which is due to Him by His creatures; for who will worship the Unknown, even though it be spelled with a capital U? It is also most injurious to society; for it throws doubt upon the final accountability of men, and thus destroys the only adequate sanction of the natural law.

Article II. The Perfect Simplicity of God.

235. We have seen that all perfections belong to God; we must now prove that they are all really one, not distinct from one another except in our manner of conceiving them: this is meant by saying that God is perfectly simple. For **simplicity**, as explained in *Ontology* (No. 90), is the perfection which makes a being identical with all that is in it; while **composition**, the opposite of simplicity, implies a distinction of parts. Composition is *real* when the parts are distinct from one another in fact, in the compound object itself; it is *logical*, or mental, when the distinction is only between our concepts. Now, we do not pretend that there is no distinction between the various concepts which we form of God's perfections, that we do not trace logical distinctions in Him; in fact, we cannot help doing so, and our mental distinctions have a true foundation in the reality. For we cannot take in all the being of God at a glance; we learn His essence, as it were, piecemeal from what we observe in creatures, whose perfections must have some prototype in His own nature; therefore we affirm distinct attributes of God, and we have reasons to do so. But we are now to show that the perfections of God which correspond to our distinct concepts are not really distinct in Him; they are but the different aspects under which we view the same reality.

236. **Thesis III.** *God is absolutely simple.*

Proof. That being is absolutely simple which excludes every kind of real composition; now, such is God; therefore He is absolutely simple.

The minor may be proved: I. *In general.* Any real composition must consist of finite parts, else the parts would be equal to the whole; but no union of finite things can make

up an infinite being, as God is; therefore He does not consist of parts. II. *In particular.* God excludes all composition.

1. Of *physical parts:*
   (*a*) Of *integral* parts; for integral parts make up quantity, and in the infinite being they would have to make up infinite quantity; but an infinite quantity actually existing is absurd.
   (*b*) Of *substantial* parts, such as matter and form; for each part would be finite, and no union of finite things can make the infinite.
   (*c*) Of *accidental* parts; for nothing can be accidental in the necessary being.
2. Of *metaphysical parts*, viz.:
   (*a*) Of *essence and existence;* for existence is essential to the necessary being.
   (*b*) Of *substance and accident;* for the accident would be something finite and the substance something finite; and these two finite things would constitute an infinite being.
   (*c*) Of *power and act;* for the infinite Being has essentially all perfection, and therefore all action, since action is more perfect than mere power of action.
   (*d*) Of *essence and attributes;* for all its attributes are essential, are its physical essence.
   (*e*) Of *some attributes and other attributes;* for if these were really distinct from each other, they would be finite, and finite things would make up an infinite being.
   (*f*) Of *genus and species;* for the genus and the specific difference would be finite. Besides, God is not in any genus; nothing is univocally predicated of Him and of a creature. (No. 16.)

(*g*) Of *species and individual;* for God is essentially whatever He is, and therefore His very individuality is essential to Him.

237. Some important **corollaries** flow from this thesis: 1. That God is a substantial act, a *pure act* without potentiality or power as distinct from action or from the reception of any further perfection, one infinite act, embracing all the objects of His activity. 2. That matter, which is essentially potential, cannot be God nor part of God; and therefore that Pantheism, which makes all things God, is an absurdity. 3. That the nature of God is not divisible; and therefore that, once we learn by Revelation that there are **three really distinct Persons in God,** we know that they must have the same individual nature; nor can there be a real distinction between the nature of God and the Persons, but only between the Persons as such, so that the Father is not the Son, and yet He is the same being as the Son.

238. **Objections:** 1. Holy Writ attributes hands and feet to God, as also passions, all which supposes an organism. *Answer.* Holy Writ usually presents God to us in figurative language wisely adapted to our manner of understanding, viz., in connection with our imagination.

2. Pantheists argue that an infinite substance excludes all finite substances, and therefore whatever exists must be a part of God *Answer.* There is no contradiction between the existence of the infinite substance and that of finite substances; these are not to be conceived as bodies which naturally exclude one another from the place they occupy.

3. But if God has all entity, He contains all creatures, for these are entities. *Answer.* God contains all entity eminently, but not the formal entities that

constitute the creatures. It is proper to remark here that various modern theories are implicitly pantheistic, making the world the one necessary being. Now, **Pantheism** is not only metaphysically absurd, as proved in the first chapter of *Cosmology*, but it is also destructive of morality among men; for if we are God, or parts of God, we certainly can do no wrong, we are not responsible to a supreme Judge and Lord; each of us is fully justified in doing as he pleases. With such a doctrine there is an end to all moral obligation, and there would soon be an end to human society.

CHAPTER III.

THE QUIESCENT ATTRIBUTES OF GOD.

239. We have stated above (No. 231) that self-existence is generally held to be the **metaphysical essence** of God; by which we simply mean that when our mind, incapable of understanding the infinite being by one concept, forms partial concepts of His perfections and strives to put order in its knowledge, we designate self-existence as its essence, but only a quasi-essence—*i. e.*, as the note from which all the other perfections discerned in God flow, after the manner that attributes do from the essence of a created being. These perfections or **attributes** of God may, for convenience' sake, be classified under two heads—namely, His *quiescent* attributes, those that do not formally regard action, and His *operative* attributes, which formally regard action.

We are now to treat of the former class, and we shall consider in particular the unity, the immutability, the eternity, and the immensity of God.

240. **Thesis IV.** *There can be only one God.*

Proof 1. If there were more gods than one, they either could or could not will opposite effects; if they could not, they would not be free and independent, not infinite; if they could will such effects, they could not give efficacy to their contradictory wills, they could not be all-powerful. But a being that is not every way infinite is not God.

Proof 2. If there were more gods than one, there would be various infinite beings; but this cannot be. For, being

infinite, such gods would have all perfections, and therefore everything that the one had the other would also have; they would then not differ except numerically. But they could not differ numerically; for this would suppose that their individuality would be really distinct from their essence, since the essence is really separated in the second god from the individuality of the first. But we have seen that there is no real distinction between the essence of God and His individuality. Therefore there is only one God.

241. **Objections:** 1. The arguments just laid down would prove as well that there can be but one Person in God. *Answer.* They prove only this, that everything in God is one individual Being, and such are really the three divine Persons.

2. The consent of nations was at one time in favor of polytheism. *Answer.* Most nations considered the so-called gods as subjects of one supreme Being, the one only God.

3. One infinitely perfect God will not account for the evil that is in the world. *Answer.* The creature is the cause of the moral evil; and, as to physical evil, God can cause it; for He does not owe His creatures anything, and it is not unworthy of Himself to give them a finite happiness of mixed enjoyment and suffering, especially since men can turn their sufferings into merit. As for the sufferings of the brute animal, they are far less than we often imagine. (See *Dublin Review*, Jan., 1888, "The Ethics of Animal Suffering," Vaughan.)

4. But an infinitely perfect God could not create a being capable of doing moral evil. *Answer.* This we absolutely deny: in giving us a free will God gives us a very good thing, and He does so for a very good

purpose, that we may honor Him with it and benefit ourselves; if we abuse His gift, He knows how to draw good out of evil, exercising His mercy in pardoning and His justice in punishing.

242. Among the civilized nations the unity of God is now universally recognized. In ancient times, though the worship of many gods was a wide-spread error among the masses, it found little favor with the philosophers, except in the form of dualism, which supposed two necessary beings, the one all good and the other all evil. In the beginning of the Christian era the Gnostics borrowed that error from the Persians, and made it popular in several parts of Europe. Afterwards the Manichæans, and later on the Albigenses, adopted the same absurd theory. It was revived in the sixteenth century by the erratic Pierre Bayle, the author of the *Historical and Critical Dictionary*, but it is now universally abandoned. The only ground for the theory was the difficulty of reconciling the existence of one infinitely good God with the presence of evil in this world. They imagined, therefore, that evil proceeded from an evil being, which they supposed could not have been produced by a good cause, and therefore they considered it as self-existent. Bayle conjectured that the good and the bad principles had made a compact to blend their works with each other. It would be difficult to imagine a more unphilosophic error. For a being all evil would have no perfection, and therefore no entity at all; and a being that would be driven to make a compact with the evil principle would be either wicked or weak, certainly not the infinitely good God. This is one of the many examples which the history of philosophy affords, showing us how self-conceited theorizers will often refuse to accept some well-established truths owing to some apparent difficulties, and, rather than modestly acknowledge

the limitation of their intellects, build up systems full of wild conjectures and flat self-contradictions.

243 **Thesis V.** *God is absolutely immutable.*

Explanation. We maintain that there cannot be changes intrinsic to God; there may be extrinsic changes, changes in the relations between God and creatures, as when the world began to exist and thus God became its Creator, or when Lucifer fell and was thenceforth hated, while before he was loved by his Maker: in such cases all the intrinsic change is on the part of the creature.

Proof. An intrinsic change supposes the removal of a perfection or entity, or the addition of a perfection, or the exchange of one perfection for another. But nothing of the kind can occur in God; for, since all His perfections are necessary, He cannot lose them, and, having all, He can acquire no more, nor exchange one for another.

244. **Objections:** 1. God is free; therefore He can change His mind. *Answer.* He has all the perfection, but not the imperfections of free will; now, the power of changing one's mind implies an imperfection.

2. God is influenced to change His will by the prayers of His creatures. *Answer.* He knew from eternity all future prayers, and therefore He determined from eternity what He would do in consideration of those prayers. When we delay to determine a conclusion, it is either because we are without proper information, or because we do not know what is best, or because we are sluggish or timid; God has no reason to delay His choice.

3. If God cannot change, He cannot threaten and yet pardon. *Answer.* He determined from eternity to threaten conditionally, and execute His threat or pardon according to the circumstances which He foreknew.

Further difficulties on this point will be answered further on, in connection with the liberty of God (No. 256); others were considered when treating of human liberty (No. 199).

245. **Thesis VI.** *God is eternal.*

Proof. Eternity, as beautifully defined by the Christian philosopher Boëthius, is "the simultaneously full and perfect possession of a life that has neither beginning nor end"—*Interminabilis vitæ tota simul et perfecta possessio;* now, such possession belongs to God. For,

(*a*) Since God is a self-existent, and therefore a necessary being, His life is without beginning and without end; because He is immutable, He must possess His life simultaneously in all its fulness; and because He is infinitely perfect, He must possess it perfectly.

(*b*) Since God is absolutely simple, there is in Him no real distinction between power and act, nor between one act and another; He is, therefore, one pure and substantial act; therefore He possesses the fulness of His life, not as broken up into moments, but simultaneously; and because His existence is His very essence, His full enjoyment of life is without beginning and without end.

246. **Objections:** 1. All reality must be in God; but time is a reality; therefore it is in God. *Answer.* Every pure perfection or reality is in God formally; but time is not a pure, but a mixed reality, for time is the measure of successions in finite beings; as such it implies an imperfection or limit of existence which, of course, cannot be in God. Time is, however, eminently in God; for eternity contains all the perfection of time.

2. Eternity, as explained in the proof of this thesis, would seem to be full at each moment; but we

co-exist with some of those moments: therefore we co-exist with eternity. *Answer.* We co-exist with God, who is eternal, but not with the eternity of God. For we cannot say that eternity is full at each moment, but that it is not divisible into moments. Eternity may be said to co-exist with each moment, and yet each moment does not co-exist with all eternity.

247. **Thesis VII.** *God is omnipresent and without limit.*

Explanation. 1. The **omnipresence** or ubiquity of God means His presence in all existing things, and therefore in all real space; His **immensity** means His essential existence without limit of space, so that there is no real or possible space outside of Him. 2. Besides, the omnipresence of God, as implying a relation to creatures, cannot be predicated of Him unless creatures exist—it is a relative perfection; but His immensity is an absolute perfection of His being, and as such it had no beginning. 3. God's immensity should not be imagined as something extended; for whatever is extended has quantity and therefore cannot be infinite. But it is with the immensity of God in respect to space as it is with His eternity in respect to time: He is whole and entire wherever He is and whenever He is.

1st Part. God is omnipresent. Proof. All creatures exist for no other reason than that God gives them existence and keeps them in existence. But He cannot act where He is not present · for nothing can be a cause where it is not, since there it is nothing, and nothing cannot produce any effect. Therefore God is present in everything.

2d Part. God is unbounded. Proof 1. Else He would have limits of some kind, and therefore would not be truly infinite. *Proof* 2. He would not be all-powerful to create if He were confined to any space; but He is all-

powerful, therefore He is not confined to any space. The major proposition is evident; for if He were confined to any space, He could not create beyond that space, since a being cannot act where it is not; therefore He would not be all-powerful.

248. There are **three ways in which God is in a creature**: 1. By His *essence*, *i. e.*, by existing in that creature. 2. By His *power*, *i. e.*, by working in that creature, giving it existence and everything it has. 3. By His presence, knowing the creature and in some cases making Himself known to it. It is very different with creatures; thus, a king may be said to be throughout his kingdom by his power, to be present to his troops when he reviews them, but he is essentially or substantially confined to the narrow compass of his body.

CHAPTER IV.

THE OPERATIVE ATTRIBUTES OF GOD.

249. The **operative attributes** of God are those which imply action; they are His *knowledge*, His *will*, and His *power*.

Article I. The Knowledge of God.

250. Since God is absolutely simple, His knowledge, subjectively considered, cannot be made up of different ideas, but must be identical with the one substantial act, which constitutes His essence. Objectively considered, His knowledge may be distinguished according to three classes of objects, into which all things that are knowable may be divided: 1. His knowledge of **pure intelligence** embraces His own essence, as imitable in possible creatures. 2. His knowledge of **vision** comprises His own essence in itself and all that is ever actualized in creatures, whether past, present, or future. 3. His **conditional knowledge** regards all that any creature would do under any circumstances; it is styled *scientia media*, because it holds a middle position between the knowledge of actual and that of possible beings. For instance, the assertion "If Cæsar had not been slain, he would have assumed the royal purple" is either true or false; we do not know whether it is the one or the other; but we say about all such propositions, "God alone knows." This is what we mean by His conditional knowledge.

251. **Thesis VIII.** *God knows all things possible and all*

things actual, whether past, present, or future; and even all that any free creature would do, in any given case.

Proof 1. *Direct.* Since God is infinitely perfect, He must know all truth; but there is truth in any judgment that may be formed on any of these matters or in the contradictory of that judgment; therefore God must know it. For instance, the assertion "If Cæsar had not been slain, he would have assumed the royal purple" is true, or its contradictory is true; now, all truth must be known by an infinitely perfect being.

Proof 2. *Indirect.* If God did not know all these things, He could not govern His creatures with infallible wisdom; He might be disappointed, taken unawares by an unexpected free act of man or angel; He would thus not be infinite in wisdom.

252. **Objections:** 1. If God knows what any person's will would choose to do in a given case, it must be because He knows the nature of that will so intimately as to see what that will must choose in a given case; therefore that will *must* make that choice, owing to its very nature; therefore it is not free. *Answer.* We grant that a will which *must* act in a certain fixed way is not really free; but that is not the way with our will, nor with God's conditional knowledge of our choice in a given case. He knows what we would choose, not because we *must* so choose, but only because we *would* so choose; for that we would, is an objective truth and a knowable truth.

2. That which has no being cannot be an object of knowledge, but conditional acts never happening have no being. *Answer.* They have no physical, but they have logical being; for judgments can be formed about them, and those judgments have truth or falsity.

3. What God knows will happen must necessarily happen, and therefore it cannot be a free act. *Answer.* The word 'necessarily' has two meanings: it will necessarily, *i. e.*, infallibly, happen, for what is future is infallibly future, just as what is past is infallibly past; but it will not happen necessarily, *i. e.*, without freedom; just as our past acts were free when we did them: knowledge does not destroy liberty.
4. The explanation given makes God's knowledge of what we would do dependent on our choice; but God cannot in any way depend on any creature. *Answer.* God's knowledge, subjectively considered, is independent of all creatures, for He does not receive His power of knowing from creatures; but, objectively considered, knowledge necessarily supposes the object known, and it argues no imperfection in God that His knowledge of our free acts supposes our free acts and is consequent on our acts.

253. The attribute of **wisdom** may, in one sense of the word, be ranked with that of Divine knowledge; for wisdom often means the knowledge of things in their highest causes. Thus considered, all the knowledge of God is properly denominated wisdom; for He knows all things as they stand related to their highest causes. In another and more usual sense, as St. Thomas fully explains (*Contra Gentes*, c. i.), wisdom comprises both knowledge and action, and means the proper direction of things to their highest ends. As such, God's wisdom is manifested by the effects of His providence, of which we shall treat in connection with His power. (No. 266.)

Article II. The Will of God.

254. **The will of God** is not, like ours, a power passing occasionally into acts, but it is one act loving and willing

all that is necessary, viz., His own essence, and determining freely what contingent things shall be, and what others shall not be, allowing meanwhile for the free choice of His intelligent creatures.

God's love of creatures is nothing else than His will to bestow happiness. This will is often conditional, His actual conferring of benefits being made dependent on the free acceptance of intelligent creatures, whom He earnestly desires to make happy. His will viewed as antecedent to free acceptance is called His **antecedent will**; viewed as taking into account the acceptance or refusal of free creatures, it is styled His **consequent will.** The latter is always efficacious; but the antecedent will may remain inefficacious, because the creature refuses to comply with the required conditions. We shall consider the will of God under three aspects: as *free*, as *holy*, and as *good.*

255. I. **Freedom, or liberty,** is the power of choosing between two or more things: (*a*) The power of choosing whether a thing shall be or not be is called **liberty of contradiction.** (*b*) The power of choice between two contraries, such as good and evil, is **liberty of contrariety**; a defect is implied in the power of choosing evil, and, of course, it is not in God. (*c*) The power of choice between one thing and another not contradictory is the **liberty of specification**; we attribute to God liberty in all its perfection.

256. **Thesis IX.** *God is free in all His external acts.*

Explanation. By external acts we mean all His acts in regard to creatures; and we maintain that God from eternity, by a single act of His will, determines affirmatively or negatively all possible questions concerning all possible creatures, so, however, as not to interfere with the free acts of His free creatures. His act of determining is not free as to its entity, but as to its term; *i. e.*, He must determine every question,

but He can determine it as He pleases, compatibly with His infinite perfections.

Proof 1. A well-ordered will is in conformity with a perfect intellect; now, a perfect intellect directs that what is necessary shall be willed absolutely; what is unnecessary, freely. But all created things are unnecessary, therefore God wills them freely.

Proof 2. If God were necessitated to will anything outside of Himself, this necessity would arise from Himself or from another being; but it could arise from neither. 1. Not from another; for all other beings are contingent, and therefore cannot necessitate their own existence. 2. Not from Himself; for this would suppose that there is something wanting to Him, some want to be supplied by creating, which could not be supplied by not creating; but this cannot be, else He would not be infinitely perfect, and His perfection would require a finite complement in order to become infinite.

257. **Objections**: 1. God cannot do wrong; therefore He is not free. *Answer.* The power of doing wrong implies a defect of the intellect or the will; it is not a perfection of liberty.

2. Liberty supposes potentiality, *i. e.*, something that may be or not be; but there is no potentiality in God. *Answer.* It supposes potentiality on the part of the term or object willed, on the part of the creature, not on the part of the Creator.

3. A free act is contingent, for it is not necessary; but God's acts are necessary. *Answer.* God's act is necessary; the contingency is in the object or term.

4. If God were free, He could change His decrees; but He cannot. *Answer.* God can do nothing inconsistent with any of His perfections; now, a change of

design would suppose that He has learned new motives for deciding, or that He changed His mind without reason. Besides, though the matter is far above our grasp to explain fully, there is but one act in God; hence no change is possible, and still that act is free with regard to creatures.

258. **Holiness,** or **sanctity,** means the love of what is right or morally good, and the hatred of what is wrong or morally evil; viewed as an attribute of God, it may be defined, the immutable will of God to act in conformity with His perfection, in a manner worthy of Himself. Perfect sanctity is evidently essential to the infinitely perfect Being.

259. **Thesis X.** *God is infinitely good.*

Proof. Goodness has various meanings, in each of which it is infinite in God. 1. Goodness, as a *transcendental*, is being, viewed as desirable; in this sense it is clear that God is infinitely good, inasmuch as He is infinite being, and therefore an infinite object of desire. 2. Goodness may be taken in the moral sense of conformity to the law of reason; it is then synonymous with *sanctity;* it must be perfect in the infinitely perfect Being. 3. Goodness is often taken in a relative sense, and signifies an earnest will to make others happy; it is then often called *bounty* or *beneficence.* In this sense it is infinite as an attribute of God; for it has been proved *a priori* that the self-existent Being is infinitely perfect. His bounty, however, is not infinite in its manifestations or effects, for all the works of God must be finite in finite creatures. Therefore we cannot prove *a posteriori* that God is infinitely bountiful.

260. **Objections:** 1. If God possessed infinite moral goodness, He would manifest His hatred of sin by not allowing sin to exist. *Answer.* God, indeed, detests sin infinitely and forbids it absolutely; but there are

two ways in which hatred of sin can manifest itself, viz., by preventing its existence, and, without preventing it, by repairing the evil with full compensation. God often chooses the latter way; He punishes some of the guilty with endless punishment, and He has Himself made an atonement of infinite merit for the sins of men. (Nos. 115, 118.) (See on this matter "A Sceptical Difficulty against Creation," by Rev. R. F. Clarke, S.J., *American Catholic Quarterly Review*, April, 1887.)

2. If God were infinitely bountiful, He would make all His creatures happy. *Answer.* He would seriously wish all to be happy, we grant; He would make them happy against their will, we deny. The manifestation of His goodness must have a limit, which it is for Him to determine, or to place, if he so chooses, in the determination of man's free will.

Article III. The Power of God.

261. **Thesis XI.** *God is omnipotent.*

Proof. Omnipotence is infinite power; now, power is a perfection, something which it is better to have than not to have, and the self-existent Being has all perfections; therefore He is omnipotent.

262. **Objections:** 1. God cannot create all possible things together, because they would constitute an infinite number; therefore He cannot do all things. *Answer.* He can do all things; but anything self-contradictory is not truly a thing. The fact that all possible things cannot be actualized together is not owing to any limit in God's power, but to a necessary limit in all finite things; for these cannot co-exist without making a number,

and an infinite number of things actually existing is absurd.

2. God cannot create a square circle, nor an infinitely perfect being. *Answer.* Both these involve contradictions; for square denies the roundness essential to a circle, and a creature, by the very fact that it is a creature, cannot be infinitely perfect.

263. **Thesis XII.** *The preservation of created beings requires at every moment the active influence of God's power and will.*

Explanation. We do not mean that God need protect every creature against other creatures or against the action of the natural laws; but that all and any created being would cease to exist, if God ceased for a moment actually to will its existence, just as the figure of a body of water would at once cease to exist if the vessel holding it were destroyed.

Proof. The present existence of a contingent being cannot, by itself, be the cause of its future existence; for the cause must contain the effect, and the present existence does not contain the future existence. Therefore another cause must exist for the permanence of that being. If this other cause be itself unnecessary or contingent, it, too, will be unable to exist and act just then, except in virtue of another cause giving it then and there existence and power of action. And thus no contingent being could continue to exist from one moment to another, except in virtue of an influence not itself contingent nor dependent, which is nothing else than the power and will of God. This may be illustrated by reflecting that the strength of a manufactured article depends on the strength, or power of permanence, of the material of which it is made. If no material were used, there could be no power of permanence, except as far as the maker continued to give it existence; now, all creation is not made out of a pre-existing material; therefore its

preservation depends at any moment on the active influence of the Creator.

264. By a similar reasoning it may be proved that God not only keeps all things in existence, but that He actually **concurs with every act** of every creature. For creatures depend on God totally—that is, according to all their entity; but there is in every act an entity which is beyond the mere power of acting; therefore the act also, and not merely the power, must depend on God.

265. **God's concurrence with a free act** of a creature does not in the least interfere with its liberty; for by the very fact that He makes the being free He concurs with it in acting one way or another, as the free will chooses. The free act is man's and it is God's, but with a difference: as a boat is supported by the water, propelled and directed truly by the efforts of man, but by means of the water; so human actions proceed truly from man, but with the concurrence of God.

266. The **Providence** of God is the wisdom whereby He directs things to their proper ends.

Thesis XIII. *Every event in the world is directed by Divine Providence.*

Proof 1. This is a dictate of common sense; for all men look up to God as the supreme Controller of every one's destiny, and all nations, even while believing to some extent in fate, as some did, still prayed to God as the Dispenser of good and evil.

Proof 2. It is the part of wisdom to direct all things to their proper ends by proper means; but God is infinitely wise, since He is infinitely perfect; therefore He directs all things to proper ends by proper means. Now, He could not do so unless He directed every event in the world; therefore He directs every event in the world.

267. **Objections:** 1. All men agree that some things

happen by accident, but accident means the absence of design. *Answer.* All agree that things happen which are not the result of design on the part of men; but they do not deny that everything which happens is willed or permitted by Almighty God. If God specially and directly intends anything with regard to any creature, it is said to proceed from a special providence of God; else it is attributed to the general providence of God, who sees and wills distinctly all the consequences of the natural laws.

2. At least the events proceeding from human design are not directed by the providence of God, *e. g.*, the wicked plots of murderers. *Answer.* The physical actions of even the worst men and the effects of such actions cannot exist except with the permissive will and the actual concurrence of God; He can and does direct even these to proper ends not intended by the evil-doers, *e. g.*, that He may increase the merit of His martyrs and of the good in general. Therefore Holy Writ says: "We know that to them that love God all things work together unto good" (Rom. viii. 28).
3. It were unworthy of God to mind little things. *Answer.* No more than it is unworthy of a good painter to mind every detail of his painting. Besides, the most perfect creature is as nothing compared to God, and nothing is little when viewed as directed by Him to a high purpose.
4. If God rules all events, men need and can do nothing. *Answer.* This were true if God ruled all events without regard to the actions of men; but not if, as is the case, He allows free causes to act freely, knowing, meanwhile, how to draw ultimate good from present evil.

5. A wise Providence would punish crime and reward virtue; but this is not always done in this world. *Answer.* It only follows that it will be done in the next world, where God has an eternity to manifest His goodness and His justice.
6. If there were a Providence, there would not be so much misery and so much inequality among men. *Answer.* Much of the evils of life comes from the vices of men, which God need not hinder for the present, but which will be atoned for in due time. Often sufferings and inequalities are part of His grand design of sanctifying souls. Besides, there is no reason why God should treat all His creatures alike; on the contrary, the poet has truly said:

> "Order is heaven's first law, and, this confessed,
> One is and must be greater than the rest,
> More rich, more wise;
> This who denies,
> Denies all common sense."

THE END.

ALPHABETICAL INDEX.

I. refers to the Logic; II., to the Mental Philosophy; 1, 2, 3, etc., to the paragraphs.

Abstract, ideas, I. 11, 122 to 124, 148; II. 176, 182; number, 38.
Accident, one of the predicables, I. 13; opposed to substance, II. 49, 50, 58, 59.
Accidental cause, II. 77.
Act, pure, I. 237.
Action, II. 50, 55, 63 to 65, 78, 79, 85.
Actual, being, II. 6, 12; division, 91.
Adaptation of means to end, II. 150.
Aevum, II. 70.
Agnosticism, II. 103, 216, 217, 219, 234.
Ambiguous middle, I. 57.
Analogy, I. 16, 50 to 52; II. 10.
Analytic, judgments, I. 17, 63, 125 to 127; reasoning, 64 to 66.
Anatomy, II. 157.
Angels, I. 13 to 16; II. 139, 141 to 143; species fixed, II. 155.
Anselm, St., II. 118.
Answering objections, I. 55,
Apparent conflict, of reason and Revelation, I. 3; of sciences, 68.
Appetite, II. 191, 192, 195, 196.
Appreciation, power of, II. 167.
Apprehension, I. 9, 75 to 77.
Argumentation, I. 22.
Argumentum ad hominem, I. 54.
Aristotle, II. 48, 101, 127.
Atheists, II. 219, 225.
Atomic theory, II. 131, 133.
Attribute, I. 13; II. 36; of God, 239.
Authority, I. 152 to 156.

Beauty, II. 46, 47.
Begging the question, I. 58.
Being, II. 6; actual, possible, real, 7, 8, 12; logical, physical, 11; not a genus, 13; determination of, 14; possible, 17 to 27; necessary, 97.
Belief, I. 153.
Berkeley, I. 144.
Boscowich, II. 130.
Brute, animals, I. 148; for man, II. 138, 152; soul, 146 to 148.

Categorical, propositions, I. 21; syllogisms, 23.
Categories, II. 48.
Causality, limits to, II. 85; principle of, 86 to 88.
Cause, defined, II. 74; formally, materially, 76; material, formal, substantial, accidental, final, 77 to 79; efficient, 81; first, second, properly, accidentally, principal, instrumental, free, necessary, moral, physical, 83; contains effect formally, eminently, virtually, univocal, 84; has reality, 85.
Certainty, I. 70, 71, 78, 112, 113;

elements of, 84; philosophical, 85; species of, 86, 87; existence of, 89 to 99; criterion of, 165 to 170; sources of, 100 to 164.
Change, II. 98, 99, 105.
Chemistry, II. 128, 133.
Circle, exercise of the, I. 69.
Clear ideas, Descartes', I. 168.
Cognition, II. 159; sensible, rational, 175, etc.
Cognoscive powers, sketch of, I. 100 to 111.
Common objects of sense-perception, I. 148.
Common sense, I. 156 to 164; the, 103; consent, 159.
Composition, II. 91; and division, I. 57.
Comprehension of ideas, I. 16, 20, 25.
Conception, concept, I. 9.
Conceptualists, I. 124; II. 184, 185.
Conclusion, I. 24, 25, 29.
Concrete, ideas, I. 11; number, II. 38.
Concurrence with second causes, II. 264, 265.
Condition, II. 82.
Conditional knowledge, II. 250 to 253; propositions, I. 21; syllogisms, 35.
Conjunctive, propositions, I. 21; syllogisms, 37.
Consciousness, I. 111, 114 to 118.
Consequence, consequent, I. 29, 32.
Constructing syllogisms, I. 24, 25.
Contingent being, II. 96, 97, 220.
Copula, I. 19.
Cosmology, II. 4, 100.
Creation, II. 106 to 108; purpose of, 113 to 115: of the soul, 211.
Criterion, ultimate, of certainty, I. 165 to 170; of a true miracle, II. 124.
Criticising syllogisms, I. 31, 32.
Crystals, II. 129, 140.

Darwinian theory, II. 208; see "Evolution."
Descartes, II. 134; methodic doubt of, I. 95, 96; clear ideas of, 168.
Determinations of being, II. 14.
Dialectics, I. 6, 7.
Dialectic syllogism, I. 49.
Difference, specific, I. 13.
Dilemma, I. 41, 42.
Disjunctive, proposition, I. 21; syllogism, 36.
Distant action, II. 85.
Distinction, II. 40; of the sciences, I. 67.
Distributed ideas, I. 16.
Doubt, I. 78, 82; methodic, 95, 96.
Dreams, I. 147; II. 168, 170.
Dualism, II. 243.
Dynamic theory, II. 130, 133.

Effect, see "Cause."
Efficient cause, II. 81.
Elements, of certainty, I. 84, 88; of matter, II. 126.
Eminent cause, II. 84.
Enthymeme, I. 38.
Epicherema, I. 43.
Equivocal, cause, II. 84; terms, I. 16.
Equivocation, I. 57.
Error, I. 78 to 83.
Essence, specific, I. 13; defined, II. 28; physical, metaphysical, 30; eternal, 31; knowledge of, 32; of God, 228.
Eternity, II. 70, 245, 246; of punishment, 118, 215.
Ethics, I. 1.
Eucharist, Holy, II. 58, 134.
Evasion, I. 54.
Evidence, mediate, immediate, I. 18;

defined, 167; the ultimate criterion of certainty, 169, 170.
Evil, II. 45, 241, 242, 267; spirits, 123 to 125; I. 147.
Evolution, II. 156 to 158, 208 to 210, 226.
Exemplars, II. 20, 21.
Exemplary cause, II. 80.
Exercise in reasoning, I. 69.
Existence, II. 33; of God, 220, etc.
Extension, of ideas, I. 16; of propositions, 20; of predicate, 21; of bodies, II. 127, 132 to 134.
Extreme terms, I. 29.

Fallacies, I. 56, etc.
Falsity, I. 73; II. 42.
Fichte, II. 102; I. 144, 145.
Figment of reason, II. 7.
Figure, II. 136, 140.
Final cause, II. 77 to 79.
First, fact, principle, condition, I. 98; principles, 60, II. 35; cause, 83.
Foreknowledge, II. 199; 250 to 252.
Form, of syllogism, I. 19, 29; of living bodies, II. 144, 203 to 206; matter and, see "Matter."
Formal, cause, II. 77, 84; objects of sciences, I. 67; object of metaphysics, II. 3, 8, 133.
Free, will, the source of error, I. 81; cause, II. 83; will, in man, 194 to 199; in God, 255.

Genus, I. 13 to 15.
Geology, II. 111.
Glory, II. 115, 153.
God, defined, II. 219; exists, 220 to 227; essence of, 228; perfection of, 233, 234; simplicity of, 235 to 238; attributes of, 239; unity of, 240, 241; immortality of, 243, 244; eternity of, 245, 246; omnipresence, immensity of, 247, 248; knowledge of, 250 to 253; will of, 254 to 257; holiness of, 258; goodness of, 259, 260; omnipotence of, 261 to 263; concurrence of, 264, 265; providence of, 266, 267.
Goodness, II. 36, 43; kinds of, 44.
Growth, II. 140, 143.

Habiliment, II. 50, 73.
Harper, Rev. Thos., II. 14, 41, 133.
Highest genus, I. 14.
Holiness, II. 258.
Hume, I. 145; II. 53, 123.
Huxley, I. 10, 164; II. 123, 155, 199, 201, 209.
Hypnotism, II. 124.
Hypothesis, I. 53.
Hypothetic, proposition, 21; syllogism, 34 to 37; impossibility, II. 96.

Idea, I. 9; abstract, concrete, 11; singular, particular, universal, 12; distributed, 16; primary, 119 to 121; not innate, II. 178, 180; how acquired, 180 to 183; of being not that of God, 15, 16; of infinity, 95.
Idealism, I. 144; II. 102.
Identity, II. 39, 57.
Ignorance, I. 78, 82.
Imagination, I. 105; II. 165.
Immanent action, II. 65.
Immensity of God, II. 247.
Immutability, II. 98; of God, 243, 244.
Impenetrability, II. 135.
Indirect reasoning, I. 54.
Individuality, II. 41.
Induction, I. 44 to 48, 170.
Inertia, II. 138.
Infinite, II. 92 to 94; idea of, 95; perfection, 253.
Inhesion, II. 58.
Inner sense, I. 103 to 105, 115; reliable, 139 to 141.

Instance, I. 54.
Instinct, II. 149 to 152.
Instrumental cause, II. 83.
Intellect, I. 107, 112, 113, 148; in action, receptive, II. 177, 182.
Intellectual, memory, I. 110, 128 to 131; life, II. 139.
Intelligence not in brutes, II. 148.
Intuitions, I. 152.
Invincible error, I. 80.
Irrelevant conclusion, I. 58.

Judgment, I. 17, 18, 108; *a priori*, *a posteriori*, etc., 17, 18, 63; speculative, practical, 79; analytic is reliable, 125 to 127; consequent on sense-perception, 142 to 151; of common sense, 156 to 164.

Kant, II. 71, 130.
Knowledge, of possibles, II. 19, 20; of essences, 32; of God, 250 to 253; see "Cognition."

Language, II. 189, 190.
Laws of nature, II. 119 to 125.
Leibnitz, II. 45, 53, 130, 206, 212.
Liberty, II. 194 to 199; essence of, 197; kinds of, 255; of God, 256, 257.
Life, II. 139, 140.
Local motion, II. 137.
Locke, II. 34, 53, 57.
Logic, I. 2, 5; formal, material, critical, 6, 70.
Logical, order, I. 61; truth, falsity, 73 to 77; being, II. 11; distinction, 40; relation, 62; whole, 91.
Lunacy, I. 118, 145.

Major, terms, premises, I. 23 to 29; 32, etc.
Material, logic, I. 6, 70; cause, II. 77.
Materialism, II. 216.
Matter, of syllogism, I. 19, 29; not self-existent, II. 104 to 107; divisible, 126; and form, 127, etc., 144.
McCosh, II. 53.
Memory, I. 106, 110; reliable, 128 to 131; sensible, II. 166.
Mesmerism, II. 123, 124, 172 to 174.
Metaphysical, certainty, I. 86; essence, II. 30, 230, 231; truth, 72; whole, 91.
Metaphysics, I. 1; II. 2 to 4; formal object of, 8, 133.
Method, I. 59 to 67.
Methodic doubt, I. 95.
Middle term, I. 29.
Mill, J. S., II. 184.
Minor, term, premise, I. 23 to 29, 32.
Miracle, II. 121 to 125.
Modal accidents, II. 59; distinction, 40.
Monads, II. 130.
Moral, truth, I. 72; falsity, 73; certainty, 86, 87; II. 123; cause, 83; possibility, 18; good, 44, 45; evil, 115.
Mosaic account of creation, II. 111.
Motion, II. 69, 137.
Multiplicity, II. 38.
Mysticism, II. 186.

Nature, of a being, II. 34; laws of, 119 to 125.
Natural, appetite, II. 191; theology, 4, 218.
Necessary, being, II. 96, 220; cause, 83,
Negative argument, I. 54.
Nominalists, I. 124; II. 184, 185.
Notion, I. 9.
Notional, essence, II, 230, 231.

Objections, answers to, I. 55.
Objects of, sense-perception, I. 148.
Occasion, II. 82.

Omnipotence, II. 261 to 263.
Omnipresence, II. 247.
Omniscience, II. 253.
Oneness, see "Unity."
Ontological, order, I. 61; proof of God's existence, II. 226, 227.
Ontologists, II. 187, 188.
Ontology, II. 4, 5.
Operative attributes of God, II. 239.
Opinion, I. 78.
Order, I. 61; in the world, II. 122, 221, 224.
Organs of sense, I. 102; action of, II. 195.
Origin, of the world, II. 101; of ideas, 175 to 184; of language, 190; of the soul, 207 to 212.

Paleontology, II. 157.
Pantheism, II. 101, 103. 237, 238.
Particular, ideas, I. 12; propositions, 20.
Passion, I. 83; II. 50, 61, 63 to 65.
Perception, I. 145 to 148; II. 160 to 163.
Perfection, II. 43; absolute, relative, 117; of the world, 117, 118.
Person, II. 55; identity of, 57.
Phantasm, I. 10, 115.
Philosophic certainty, I. 85, 91.
Philosophy, defined, I. 1; divided, 1; important, 4.
Phrenology, II. 201.
Physical, being, II. 11; good, 44; evil, 45; beauty, 46; certainty, I. 86, 90, 91; II. 123; possibility, 18; essence, 30, 229, 232; cause, 74; whole, 91; laws, 119 to 125.
Physics, II. 1.
Physiology, II. 157.
Place, II. 50, 66.
Plants, II. 139, 141 to 143; 152 to 154.
Plato, II. 101, 127, 212.
Porphyrian tree, I. 15.
Positivists, II. 34.
Possibility, intrinsic, extrinsic, II. 17; moral, physical, 18.
Possible beings, II. 6, 7, 12, 17 to 27, 94; knowledge of, 19, 20, 94, 253; dependence of, on God, 22 to 27.
Posture, II. 50, 72.
Potentiality, II. 127, 128.
Power of God, II. 261, 263.
Predicables, heads of, I. 13.
Predicaments, II. 48.
Predicate, I. 19; extension, comprehension of, 20.
Pre-established harmony, II. 206.
Prejudices, I. 83.
Premises, I. 23, 25, 29, 60.
Preservation of created things, II. 263.
Primary ideas, I. 119 to 121.
Prime matter, II. 127.
Principal cause, II. 83.
Principiant, II. 74.
Principle, of identity, contradiction, excluded middle, II. 35; of sufficient reason and causality, 86 to 88.
Probable reasoning, I. 49.
Procession, II. 74, 75.
Proper objects of sense-perception, I. 148.
Property, I. 13.
Proportion, II. 47.
Propositions, I. 19; kinds of, 21, 33.
Providence of God, II. 266, 267.
Psychology, II. 4, 139.
Punishment, II. 115, 118; eternal, 215.
Pure act, II. 237.
Purpose, of work, of workman, II. 112 to 115.
Pythagoras, II. 101.

Quality, II. 50, 61; of proposition, I. 20.

Quantity, II. 50, 60, 93, 94; of proposition, I. 20.

Rational, cognition, II. 175, etc.; appetite, 191, 192.
Real, being, II. 7, 8; relation, 62; distinction, 40.
Realists, I. 124; II. 185.
Reality of causes and effects, II. 85.
Reason, I. 109.
Reasoning, I. 22; rules of syllogistic, 32; demonstrative, probable, 49; indirect, 54; *a priori*, *a posteriori*, 62, 63; analytic, synthetic, 64 to 66; gives certainty, 132 to 134, 170.
Redemption, II. 56.
Reduplication, II. 135.
Reid, I. 160.
Relation, II. 50, 62.
Retort, I. 54.
Revelation, I. 3; II. 111, 118.
Rules of syllogism, I. 31, 32.

Sameness, II. 39.
Sceptics, I. 93, 94, 97, 99; II. 85.
Schoolmen's, the, system, of matter and form, II. 127; of origin of ideas, 182.
Science, I. 5; formal objects of a, 67.
Scotus, II. 101.
Self-contradiction, I. 54.
Self-existence, II. 104, 220, 239.
Sensation, I. 135, 136; perceives concrete objects, 137; is reliable, 142 to 147; limits of its reliability, 139 to 141; how effected, II. 161 to 163; where effected, 164.
Sense, outer, I. 101, 102, 138, 142 to 151; inner, 103, 104, 138 to 141; common, 103, 163, 164; perception, II. 160; objects of, I. 148.
Sensible, memory, I. 106, 128; II. 166; judgments, 167; appetite, 191 to 196.
Sensitive, cognition, II. 159 to 167; life, 139.
Simple apprehensions, I. 8; truth of, 75 to 77.
Simplicity, II. 90, 145; of the soul, 200; of God, 235 to 238.
Singular ideas, I. 12; propositions, 20.
Sleep, II. 168, 169, 172.
Somnambulism, II. 171.
Sophisms, I. 56.
Sorites, I. 39, 40.
Soul, the form of the body, II. 144, 204 to 206; the human, is simple, 200, 201; spiritual, 202, 203; when created, 211, 212; survives body, 213; immortal, 214.
Space, II. 67 to 69, 137.
Species, I. 13 to 15; Eucharistic, II. 134; of plants and animals are fixed, 156, 157; impressed, expressed, II. 162, 163.
Specific difference, I. 13 to 15.
Spinoza, II. 52, 101.
Spirits, II. 66, 137; I. 147.
Spiritism, II. 174.
Spontaneous, II. 193.
Subordinate, genus, species, I. 14.
Substance, II. 49, etc.
Substantial, cause, II. 77; principle, 132, 144, 145.
Suffering, II. 241, 267.
Sufficient reason, II. 86 to 88.
Supposit, II. 55.
Suspicion, I. 78, 82.
Syllogism, I. 23; construction of, 24, 25; abridged form of, 27; affirmative, negative, 28; parts of, 29; valid, 30; rules of, 31, 32; hypothetical, 34 to 37.
Synthetic, judgment, I. 17; reasoning, 64 to 66.

Term, I. 10, 16, 29, 31, 32.
Thomas, St., I. 91; II. 41, 108, 110, 118, 127.
Time, II. 50, 70, 71.
Traditionalism, II. 179.
Transcendentals, II. 9.
Transient action, II. 65.
Transubstantiation, II. 99.
Trinity, the Holy, II. 74, 237.
True, beauty, II. 47; good, 44.
Truth, I. 72 to 77; II. 36, 42.
Tyndall, II. 155.

Ultimate, criterion of certainty, I. 165 to 170; particles of matter, II. 127.
Undue assumption, I. 58.
Unity, II. 36; kinds of, 37; of God, 240, 241.
Universal, ideas, I. 12, 13, 122, 224; direct, reflex, II. 183, etc.; proposition, I. 20; major, 25; cause, II. 84.
Universe, II. 100; see "World."
Univocal terms, I. 16.

Valid, syllogism, I. 30; induction, 48.
Vegetable life, II. 139.
Virtual cause, II. 84.
Vital, principle, II. 127, 129, 139 to 148; acts, 59.
Voluntary, II. 193.

When, II. 63, 70.
Whole, II. 91.
Will, II. 181, 192; antecedent, consequent, 116; of man is free, 198, 199; of God, 254 to 258.
Wisdom of God, II. 253.
World, II. 100; origin of the, 101 to 110; age of the, 111; perfection of the, 117; purpose of the, 112 to 115.

A PRACTICAL INTRODUCTION TO

English Rhetoric:

PRECEPTS AND EXERCISES.

By REV. CHARLES COPPENS, S.J.

$1.25. (*Discount is allowed to Schools.*)

Speaking of the "Rhetoric", Very Rev. Rudolph Meyer, S.J., said: "The best thing I ever did for education was to urge Father Coppens to publish that book."

"We have taken some of the most popular and approved text-books in use in our best schools and compared them with this new Introduction to English Rhetoric. The result is in every way—and in some parts to an exceptional degree—favorable to the latter.—*American Catholic Quarterly Review.*

We are happy to add another to the list of text-books for Catholic Schools of which one can write only in terms of unqualified praise. Its author, the Rev. Charles Coppens, S.J., is already well-known through his admirable "Art of Oratorical Composition." His two books, taken together, contain the entire course of rhetoric as studied in colleges and universities. But The Practical Introduction to English Rhetoric, taken alone, must have a far wider sphere of usefulness, being perfectly adapted for the higher departments of academies for girls, and for the use of the teachers themselves in the lower departments of schools for either sex, or in schools where so extended a course of rhetoric does not enter into the plan of study.—*Pilot.*

The book is the result of thirty years of work as a professor of rhetoric in various colleges conducted by the Jesuit Fathers in this country. It is a class-book, but it would make a useful and interesting book in the library of any man who admires and loves to cultivate good English. From the examination we have given the work we feel justified in pronouncing it the best English book on rhetoric that has yet been published.—*Michigan Catholic.*

THE ART OF

ORATORICAL COMPOSITION:

BASED ON THE PRECEPTS AND MODELS OF THE GREAT MASTERS.

By REV. CHARLES COPPENS, S. J.

$1.25. *(Discount is allowed to Schools.)*

"It is a clear, didactic exposition, with such illustrations from modern sources as will make it practical under our circumstances. But it is also a text-book, which is saying something apart from its general merits, as teachers will understand. . . . . Least of all has Father Coppens reason to guard himself against distrust, for he simply proves his strength by the grasp he has of the masters in his profession. . . . . For seminaries, we find here the entire course from preparatory school to the class of sacred eloquence in theology."—*American Catholic Quarterly Review.*

Father Coppens has been, over twenty-five years, a Professor of Oratory in the United States, so that he brings to this book not only the full equipment of a master of the art, but all the invaluable skill in imparting his knowledge to be acquired only, and after long trial, in the rostrum of the teacher. Father Coppens' is perhaps the most practical class-book on the speaker's art yet offered to American schools. . . . Father Coppens, wherever it is practicable, lets the acknowledged masters of oratorical composition speak for themselves, so that his pupil is made familiar, and in their own words, with the leading precepts of the great writers on oratory among both the ancients and moderns.—*Catholic World.*
